Standard Specification for
Tanks, 5 and 10-Gal (20 and 40-L) Lube Oil Dispensing

1. Scope

1.1 This specification covers the material, dimensions, and construction of 5 and 10-gal (20 and 40-L) tanks purchased to store and dispense lubricating oils. The tanks are industrial safety cans mounted on a T-bar bracket, complete with drip tray.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
A 36/A36M Specification for Carbon Structural Steel
A 108 Specification for Steel Bars, Carbon, Cold Finished, Standard Quality
A 164 Specification for Electrodeposited Coatings of Zinc on Steel
A 167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
A 308 Specification for Steel Sheet, Cold-Rolled, Terne (Lead-Tin Alloy) Coated by the Hot-Dip Process
A 569/A569M Specification for Steel, Carbon (0.15 Maximum, Percent), Hot-Rolled Sheet and Strip Commercial Quality

2.2 ASME Standards:

3. Ordering Information

3.1 Orders for tanks under this specification shall include the following:
3.1.1 Quantity (number),
3.1.2 Size, either 5 or 10 gal (20 or 40 L),
3.1.3 Purchase option for finished tank materials: Terne plate (4.1.3), and
3.1.4 ASTM designation and year of issue.

3.2 If only size, quantity, and ASTM designation are specified and no purchase options are specified, then suppliers shall furnish all stainless steel tanks, brass faucets with flash arrestors, and painted steel mounting columns with bolt-on drip tray assemblies, which include perforated steel tray liners, drain plugs, drilled mounting holes, and mounting bolts.

3.3 Optional packaging/shipping.
3.3.1 If required for shipping, tanks shall be packaged individually in cartons suitable for freight handling.

4. Materials and Manufacture

4.1 Materials:
4.1.1 316 Stainless Steel Sheet (Specification A 167), minimum thickness 24 gage (0.6 mm) on tank body, 22 gage (0.8 mm) on tank top and bottom; body bracket, filler spout, flash arrestor, vacuum breaker valve and linkage.
4.1.2 316 Stainless Steel Cast, Wrought, or Forged Flanges
4.1.3 Terne Plate Sheet (purchase option), minimum thickness 22 gage (0.8 mm) on tank body, top and bottom: body bracket, filler spout (Specification A 308).
4.1.4 Mild Steel:
4.1.4.1 Bolt-On Column Stand, T-section, hot-rolled (Specification A 36/A 36M); minimum thickness 0.160 in. (4 mm).
4.1.4.2 Drip Tray Bracket, round edge, hot-rolled (Specification A 569/A569M).
4.1.4.3 Drip Tray Assembly, hot or cold-rolled (Specification A 108).
4.1.4.4 Drip Tray Liner, 11-gage (3 mm), zinc-plated (Specification A 164).
4.1.4.5 Filler Spout Cover, zinc-plated steel (Specification A 164).
4.1.4.6 Drip Tray Drain, ¼-in. (20 mm) NPS drain.
### Dimensions

Note 1—Dimensions and construction for guidance only.
Note 2—1 in. = 25.4 mm.
Note 3—1 lb = 0.4536 Kg.

FIG. 1 Dimension of Tank
4.1.5 *Cast Brass:*

4.1.5.1 *Faucet,* lever-lock, self-closing, ¾-in. (20 mm) outside diameter, male threaded.

4.1.5.2 *Drip Tray Drain Plug and Tank Bottom Drain Plug,* ¾-in. (20 mm) NPS.

4.1.6 *Cast Aluminum,* self-closing, spring-action type, one-piece, filler spout cover lever.

4.2 *Manufacture*—All sheet metal seams shall be welded.

5. **Dimensions and Weight**

5.1 The dimensions in Fig. 1 are recommended nominal dimensions. Weights are estimated and are not critical. Volume of tanks shall be 5 and 10 gal (20 and 40 L), respectively.

---

*Protectoseal 531G, available from The Protectoseal Co., 225 Foster Ave., Bensenville, IL 60106, or equivalent, has been found suitable for this purpose.*
1. Scope

1.1 This practice lists commonly used types of branch connections for carbon steel, chromium-molybdenum steel pipe and copper-nickel alloy tubing. Branch to run size applications are given in Table 1, Table 2, and Table 3. Other types of branch connections (Fig. 1) may be used provided they comply with the requirements of Title 46 CFR Subparts 56.07-10(f) and 56.70-15(g) of the USCG Regulations.

2. Referenced Documents

2.1 ASTM Standards:
F 722 Specification for Welded Joints for Shipboard Piping Systems

2.2 ANSI Standard:
B31.1 Power Piping

2.3 Other Document:
Title 46 Code of Federal Regulations (CFR) Shipping, Parts 41 to 69

3. General Requirements

3.1 Weld joint designs shall be in accordance with Specification F 722 and the limitations therein.

3.2 Fabricated branch connections shall meet the reinforcement requirements of Section 104.3 of ANSI B31.1 as modified by Title 46, CFR Subparts 56.07-10(f) and 56.70-15(g) of the USCG regulations.

3.3 Threaded fittings shall be subject to the limitations of Title 46 CFR, Subpart 56.30-20 of the USCG Regulations.

4. Keywords

4.1 branch connections; carbon steel connections; chromium-molybdenum steel pipe; copper-nickel alloy tubing

---

1 This practice is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

FIG. 1 Illustrative Legend for Branch Connections

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for Wrought Carbon Steel Sleeve-Type Pipe Couplings

This standard is issued under the fixed designation F 682; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers wrought carbon steel sleeve-type pipe couplings suitable for joining carbon steel pipes.

1.2 Type I couplings are intended for use on all schedules of pipe in which the pipe wall thickness does not exceed the wall thickness of standard weight pipe. Type II couplings are intended for use on all schedules of pipe in which the pipe wall thickness does not exceed the wall thickness of extra strong pipe.

1.3 This specification does not cover cast steel couplings.

NOTE 1—The values stated in inch-pound units are to be regarded as the standard.

NOTE 2—See Appendix X1 for rationale used to develop this specification.

3. Classification

3.1 Couplings are furnished in two types as follows:

3.1.1 Type I—Couplings (see 1.2).

3.1.2 Type II—Couplings (see 1.2).

NOTE 3—Type II couplings may be used in place of Type I couplings for all schedules of pipe in which the pipe wall thickness does not exceed the wall thickness of standard weight piping through 18 in. or Schedule 40 piping through 16 in.

4. Ordering Information

4.1 Orders for material under this specification shall include the following information:

4.1.1 Quantity (number of couplings of each size and type),

4.1.2 Name of material (sleeve-type pipe couplings),

4.1.3 Size (nominal, see Table 1 and Table 2 and Fig. 1),

4.1.4 Type (see 3.1),

4.1.5 ASTM designation and date of issue.

5. Materials and Manufacture

5.1 Materials—The couplings shall be manufactured from material having a chemical composition conforming to the requirements of 7.1 and with the mechanical properties of Section 9.

5.2 Manufacture—The initial form of the raw material shall be at the discretion of the manufacturer except couplings shall not be machined from unformed plate. The material shall be...
such that the finished couplings conform to all of the specified requirements (see Appendix X2).

5.3 Couplings fabricated by welding shall be (a) made by welders, welding operators, and welding procedures qualified under the provisions of ASME Boiler and Pressure Vessel Code, Section IX; (b) heat treated in accordance with Section 6 of this specification; and (c) nondestructively tested as follows:

A Tolerances shall be (1) Sizes through 3 in. incl: +0.000, −0.010 in. (+0.000, −0.254 mm); (2) Sizes 3⅛ through 10 in. incl: +0.030, −0.000 in. (+0.762, −0.000 mm); and (3) Sizes above 10 in.: +0.060, −0.000 in. (+1.524, −0.000 mm).

B Tolerances shall be (1) Sizes through 10 in. incl: +0.125, −0.000 in. (+3.175, −0.000 mm) and (2) Sizes above 10 in.: +1.000, −0.000 in. (+25.4, −0.000 mm).

C Tolerances for all sizes shall be +0.250, −0.000 in. (+6.4, −0.000 mm).

† Editorially corrected.

F 682 – 82a (1998)
5.3.1 Sizes 3-in. NPS and Below—Radiographically examined throughout the entire length of each fabricated weld in accordance with Paragraph UW-51 of ASME Code, Section VIII.

5.3.2 Sizes 3 partly-in. NPS Through 16-in. NPS—No nondestructive tests required, and

5.3.3 Sizes 18-in. NPS and Above—Any method of nondestructive testing may be used provided the tests are conducted in accordance with the applicable parts of ASME Code, Section VIII.

6. Heat Treatment

6.1 Couplings Made from Plate or Tubular Products:

6.1.1 Couplings machined from tubular products need not be heat treated.

6.1.2 Hot-formed couplings upon which the final forming operation is completed at a temperature above 1150°F (621°C) and below 1800°F (982°C) need not be heat treated provided they are cooled in still air. If the manufacturer elects to heat treat such couplings it shall be by one of the procedures described in 6.3.

6.1.3 Hot-formed couplings finished at a temperature in excess of 1800°F (982°C) shall subsequently be annealed, normalized, or normalized and tempered.

6.1.4 Cold-formed couplings upon which the final forming operation is completed at a temperature below 1150°F (621°C) shall be normalized or shall be stress-relieved at 1100 to 1250°F (593 to 677°C) for 1 h/in. of thickness.

6.1.5 Couplings produced by fusion welding shall be postweld heat treated at 1100 to 1250°F (593 to 677°C), when the nominal wall thickness at the welded joint is ¾ in. or greater.

6.2 Carbon Steel Couplings Made from Forgings—Couplings made from forgings shall subsequently be annealed, normalized, or normalized and tempered.

6.3 Heat Treatment Procedures—Couplings after forming at an elevated temperature shall be cooled to a temperature below the critical range under suitable conditions to prevent injuries by too rapid cooling, but in no case more rapidly than the cooling rate in still air. Couplings that are to be heat treated shall be treated as follows:

6.3.1 Full Annealing—Couplings shall be uniformly reheated to a temperature above the transformation range and, after being held for a sufficient time at this temperature, cooled slowly to a temperature below the transformation range.

6.3.2 Normalizing—Couplings shall be uniformly reheated to a temperature above the transformation range and subsequently cooled in air at room temperature.

6.3.3 Tempering and Postweld Heat Treatment—Couplings shall be reheated to the prescribed temperature below the transformation range, held at temperature for not less than 1 h/in. of thickness at the thickest section, and cooled in the furnace or in still air.

7. Chemical Requirements

7.1 The couplings shall conform to the requirements as to chemical composition prescribed in Table 3.

7.2 Weld metal used in the construction of the couplings shall be mild steel analysis No. AI of Table QW-442, Section IX of the ASME Boiler and Pressure Vessel Code.

8. Product Analysis

8.1 Product analyses may be made by the purchaser from finished products representing each lot. The chemical composition thus determined shall conform to the requirements specified in Table 3.

8.2 In the event the couplings do not conform to the requirements specified in Table 3, referee analyses shall be made on additional couplings from the same lot in accordance with Practice E 59.

9. Mechanical Properties

9.1 The steel shall conform to the requirements as to tensile properties prescribed in Table 4.

9.2 The yield strength corresponding to a permanent offset of 0.2 % of the gage length of the specimen under load shall be determined.

9.3 Tension tests shall be made on material representative of and in the same condition of heat treatment as the finished coupling.

9.3.1 Records of the tension tests shall be certification that the material of the coupling meets the requirements of this specification provided the heat treatments are the same. If the raw material was not tested, the coupling manufacturer shall perform the required test on material representative of the finished coupling.

9.4 The tests required by this specification shall conform to those described in the latest issue of Test Methods and Definitions A 370.

10. Dimensions and Permissible Variations

10.1 The dimensions and permissible variations for sleeve couplings to this specification are prescribed in Table 1 and Table 2.

11. Workmanship, Finish, and Appearance

11.1 Sleeve couplings shall have a workmanlike finish, free of scale and injurious defects. Ends shall be finished square and without burrs.

12. Hydrostatic Testing

12.1 Hydrostatic testing is not required by this specification.

12.2 All couplings shall be capable of withstanding, without failure, leakage, or impairment of serviceability, a test pressure equal to that prescribed in the specification for the pipe with which the fitting is recommended to be used.

13. Product Marking

13.1 Identification marks consisting of the manufacturer’s symbol or name, the ASTM designation number, type, and size shall be legibly stamped on each fitting, and in such a position as not to injure the usefulness of the fitting. SP-25 may be followed except the word “steel” shall not be substituted for the ASTM designation.

13.2 Where couplings are manufactured by an activity for its own use, the marking requirements of 13.1 do not pertain.

14. Keywords

14.1 carbon steel sleeve-type pipe couplings; couplings; pipe couplings; Type I couplings; Type II couplings

APPENDIXES

X1. RATIONALE USED FOR DEVELOPMENT OF SPECIFICATION F 682

X1.1 This specification has been developed to provide two types of couplings. Type I is for use on all schedules of pipe in which the pipe wall thickness does not exceed the wall thickness of standard weight pipe. Type II is for use on all schedules of pipe in which the pipe wall thickness does not exceed the wall thickness of extra strong pipe. Note 3 provides an option that allows the use of Type II couplings in place of Type I couplings, if desired.

X1.2 The design criteria for the couplings is based on CFR Title 46, Subpart 56.70-15(d)3 and 4 as follows:

X1.2.1 For couplings through 3-in. IPS, the clearance between the system pipe outside diameter and the sleeve coupling inside diameter has been held to a maximum of 0.080 in. when considering tolerances to allow these couplings to be used in Class I piping through 3 in. when not subjected to full radiography as allowed by CFR Title 46. The inside diameter of the coupling is therefore equal to the minimum outside diameter of the pipe to be joined +0.080 in. with a tolerance of +0.000, −0.010 in. This provides for a maximum diametral clearance of 0.080 in.

Note X1.1—The minimum outside diameter of the pipe was determined by subtracting the largest minus tolerance from either Specification A 53/A 53M (ABS Grades 1, 2, and 3) or Specification A 106 (ABS Grades 4 and 5).

X1.2.2 The coupling inside diameter and tolerance in sizes 3½ in. and above for use in Class II piping has been taken from ANSI B16.5, Table 9, for slip-on flanges.

X1.2.3 The minimum length of the coupling has been set at 1 in. This satisfies the USCG requirement of ¾-in. minimum depth of pipe insertion when used in Class I piping.

X1.2.4 To meet the USCG requirement that “the fillet weld shall have a throat dimension of not less than the nominal thickness of the pipe or tubing being joined,” a coupling outside diameter of not less than the nominal outside diameter of the system pipe plus two times 1.4 $T$ has been used. ($T$ = nominal pipe thickness.)

X1.2.5 Hoop stress calculations have been performed to ensure that the strength of the coupling is equal to or greater than that of pipe being joined.

X1.3 A tolerance of +0.125, −0.000 in. was established for the outside diameter of couplings through 10 in. and a tolerance of +1.000, −0.000 in. for couplings 12 in. and larger. This allows the use of commercially available tubular products without machining the outside diameter and limits the maximum outside diameter thereby allowing designers to determine the hole size which would be required to pass a coupling through a penetration.

X1.4 Testing heat treatment requirements have been taken from Specification A 234/A 234M as discussed with USCG G-MMT-7/82.

X1.4.1 Radiography requirements have been taken from CFR Title 46, Subpart 56.95 as discussed with USCG G-MMT-7/82.

X1.5 Although marking is not specifically required by USCG, “marking” has been included in the specification to allow for material control and segregation of the couplings in industry.
X2. TUBULAR RAW STOCK MATERIAL SIZES FOR MANUFACTURE OF COUPLINGS

X2.1 Tubular products listed in Table X2.1 may be used for the manufacture of couplings without machining the coupling outside diameter. Other tubular sizes as well as other wrought materials (that is, forging, bars, billets, plate, and so forth, see 5.2) may also be used provided all the requirements of this specification are satisfied.

1. Scope

1.1 This practice provides guidance in the selection of types and thicknesses of thermal insulation materials for piping, machinery, and equipment for nonnuclear shipboard applications. Methods and materials for installation, including lagging, are also detailed.

1.2 Supplemental requirements and exceptions to the requirements discussed herein for ships of the U.S. Navy are included in Supplementary Requirements S1.

1.3 Asbestos or asbestos-containing materials shall not be used.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

---

1 This practice is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.02 on Insulation/Processes.

3. Terminology

3.1 Definitions—For definitions of terms relating to insulating materials used in this practice, refer to Terminology C 168.

4. Materials and Manufacture

4.1 Insulation and Lagging Material Specifications, as listed in Tables 1-17, describe those materials that are intended for use in the indicated temperature ranges. The specifications and requirements outlined herein are not intended to prevent the use of new test methods or materials, provided that sufficient technical data is submitted to demonstrate that the proposed test method or material is equivalent in quality, effectiveness, durability, and safety to that prescribed by this practice.

See 5.4.

See Supplementary Requirements S1.5.

See Supplementary Requirements S1.15.
5. General Requirements

5.1 Piping, including valves, fittings, and flanges conveying vapors, gases, or liquids that attain temperatures outside the range from 55 to 125°F (13 to 52°C) during normal operation, shall be insulated except as otherwise stated herein.

5.2 The insulation thicknesses specified in this practice are designed to maintain the surface temperature at or below 125°F (52°C) for fluid temperatures up to 650°F (343°C) with an ambient temperature of 85°F (29°C). For fluid temperatures above 650°F, the surface will be maintained at a maximum of 133°F (56°C).

5.2.1 Insulation thicknesses have been calculated in accordance with the computer programs in Practice C 680.

5.3 Piping and units of equipment with designated internal temperatures of 300°F (149°C) and over shall be insulated from their supports or the supports insulated from the structures to which they are attached where the heat transmitted is objectionable on the opposite side of the structure.

5.4 Insulated piping passing through accommodation, service, and control spaces must be covered with approved incombustible materials which meet 46 CFR, Sections 164.009 and 164.012. Elastomeric foam plastic insulation shall not be used in these spaces.

5.5 Special consideration shall be given to the insulation of integral piping supplied with and mounted on equipment or machinery. In these cases, alternative materials and methods of installation shall be considered provided that they comply with the performance requirements of this practice.

5.6 Minimum insulation requirements have not been established for those surfaces or applications in which insulations had not been specified in past practices. In effect, the following surfaces are excluded from insulation requirements:

5.6.1 Surfaces where application of insulation will affect proper operation.

5.6.2 Equipment, components, and systems designed for the dispersion of heat.

5.6.3 Thermostatic steam traps and 24 in. (620 mm) of piping upstream of traps, which shall not be insulated. When located in areas in which personnel protection is required, expanded metal shields or multilayer glass cloth shall be provided.

5.6.4 Mechanical joints exposed to subatmospheric pressures and those included in the fuel oil service piping from heaters to burners.

5.6.5 Fuel oil piping between headers and burners.

5.6.6 Piping above 125°F (52°C) in bilges, not within watertight enclosures.

5.6.7 Piping in locations in which sweating and resultant rust is not objectionable such as voids, bilges, and shaft alleys, plus

A See 5.4.

B Insulation and lagging materials are acceptable for the temperature ranges indicated; other materials are capable of being used provided the requirements of this practice are satisfied.

C With or without rewettable adhesive.

D See Supplementary Requirements S1.15.

E When insulating cement is used, it shall be applied in successive layers, 1/2 to 1 in. (13 to 25 mm) in thickness, until the total thickness specified in Table 7 has been reached. Galvanized iron wire netting, 1-in. (13-mm) mesh, shall be installed between layers. A 1/2-in. (13-mm) thickness of finishing cement, in accordance with Specification C 449/C 449M, shall be applied over the last layer of insulating cement.

plumbing fixtures and associated supply and drain piping immediately adjacent thereto.

5.6.8 Deadend hot water piping 3/8 in. (10 mm) and smaller.

5.6.9 Pressure-gage piping.

5.6.10 Soot-blower valve units and soot-blower flanges.

5.6.11 Piping in voids and cofferdams except where omitting insulation is detrimental to system operation, such as catapult steam.

5.6.12 Safety valve bodies, springs, and lifting gear.

5.6.13 Piping over shower stalls and behind and under lavatories.

5.6.14 Valves or flanges in the collection holding tank (CHT) system.

5.7 Higher-temperature-type insulations are capable of being used where lower-temperature-type insulations are specified, provided that they are satisfactory in all other respects.

5.8 In “high traffic” locations in which the completed insulation and lagging is liable to abuse, such as shipping, unshipping, and maintenance areas, protective sheet metal lagging shall be installed. Where metal lagging is required, any of the materials listed
in Table 13 are acceptable, except for boiler uptake applications in which metal lagging shall be galvanized sheet steel, in accordance with Specification A 653/A 653M, with Coating Designation G-115, and not less than 1⁄32 in. (0.8 mm) thick.

5.9 Before installing insulation, surface preparation of the piping is to be accomplished in accordance with the ship’s painting schedule.

5.10 Lacing hooks shall be welded to the structure or equipment (with permission of the vendor of the equipment) for securing insulation to the equipment.

5.11 For bends, fittings, and so forth, where molded sections of pipe insulation cannot be used, mitered sections of the pipe insulation or premolded fittings and covers shall be used, provided that they are suitable for the temperature and that the requirements of this practice are satisfied (see 4.1 and 5.4). Fittings in sizes under 2-in. (51–mm) nominal pipe size (NPS) shall be insulated with insulating cement, in accordance with Specification C 449/C 449M.

5.12 Where insulation specifications listed in Tables 1 and 3 provide for the use of nonmetal “jacketed”-type insulation, separate lagging material shall be omitted.

5.13 Single-layered insulation construction shall be permitted on all surfaces operating at temperatures below 600°F (316°C). Double-layered insulation construction shall be used with all joints staggered on all surfaces operating at temperatures of 600°F and above, except single-layered construction will be permitted when the total insulation thickness is 3 in. (75 mm) or less or the pipe size is NPS 2 in. (50 mm) or below.

6. Selection Requirements, Piping

6.1 Interior Piping, Temperature Range from −20 to +40°F (−29 to +4°C)—Use for air conditioning and ship’s stores refrigerant piping and other services within the temperature range.

6.1.1 For insulation and lagging materials, see Table 1.

6.1.2 For insulation thickness, see Table 4 or Table 5.

</tbody>
</table>

A Commercially known as fibrous glass.
B Thickness of mineral fiber insulation in accordance with Specification C 547, Class 2.
6.4.2 Dry firemain need only be insulated above ceilings and in areas in which damage or discomfort from condensation is a problem.

6.4.3 If cold, fresh, or potable water tanks (not having a side integral with the shell) are installed in a heated area, the piping to the pumps and therefore to the services need not be insulated. If this water is being used for flushing water closets, the drain piping need not be insulated. If this water is being used for flushing water closets, the drain piping need not be insulated. If this water is being used for flushing water closets, the drain piping need not be insulated.

6.4.4 Freshwater fill piping inside the ship shall be insulated.

6.4.5 Drains from drinking water chillers shall be insulated.

6.3 Interior Piping, Temperature Range from 126 to 450°F (52 to 232°C)—Use for hot freshwater, hot-water heating, fuel oil service discharge from heaters to headers, condensate, and air ejector piping, boiler feed, high- and low-pressure steam drain piping, and other services within the temperature range.

6.3.1 For insulation and lagging materials, see Table 1.

6.3.2 For insulation thickness, see Table 4, Table 5, Table 7, Table 8, or Table 9.

6.3.3 For installation details, see Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, or Fig. 6, as applicable.

6.3.4 Special Conditions—On piping, tubing, and fittings sized less than NPS ½ in., insulation need be applied only where required for personnel protection.

6.4 Interior Piping, Temperature Range from 451 to 1200°F (233 to 649°C)—Use for main steam, auxiliary steam, exhaust and bleed steam, gland seal steam and exhaust, high- and low-pressure steam drains, soot blower steam, boiler blow, safety and relief valves escape steam heating, diesel exhaust piping, and other services within the temperature range.

6.4.1 For insulation and lagging materials, see Table 1.
6.4.2 For insulation thickness, see Table 4, Table 7, Table 8, or Table 9, as applicable.

6.4.3 For installation details, see Fig. 1, Fig. 4, Fig. 5, or Fig. 6, as applicable.

6.4.4 Special Conditions:

6.4.4.1 The soot blower piping between the root valve and the soot blower heads shall have an insulation thickness of one half of that indicated for a continually operating system at the same temperature.

6.4.4.2 Main steam piping insulation shall be arranged with removable pads to bare sections for audio gaging when required.

6.4.4.3 Turbogenerator exhaust to main and auxiliary condensers do not require insulation except in areas susceptible to personnel contact.

6.4.4.4 Safety and relief valve escape piping need not be insulated except in areas susceptible to contact by personnel.

6.4.4.5 Boiler blow piping need not be insulated except in areas susceptible to contact by personnel.

6.4.4.6 On piping, tubing, and fittings sizes less than NPS 3/8 in. (10 mm), insulation need be applied only where required for personnel protection.

6.4.4.7 Steam smothering and steam to the sea chests need be insulated only in those areas susceptible to personnel contact.

A For use on piping and machinery insulation in locations where insulation is subject to abuse, except for uptake applications in which metal lagging shall be galvanized steel, Specification A 526/A 526M, Coating Designation G-115, not less than 1/32 in. (0.795 mm) thick.
6.5 Weather-Exposed Piping, Temperature Range from \(-20\) to \(+40\)\(^\circ\)F (\(-29\) to \(+4\)\(^\circ\)C)—Use for low-temperature piping exposed to the weather.

6.5.1 For insulation and lagging materials, see Table 2.

6.5.2 For insulation thickness, see Table 4.

6.5.3 For installation details, see Fig. 3, Fig. 7, or Fig. 8.

6.5.4 Special Conditions:

6.5.4.1 Piping exposed to the weather shall also be effectively insulated against freezing. The thickness of insulation required to prevent freezing is determined by calculation based on the system fluid, system velocity, type of insulation to be used, and climatic conditions involved. This does not apply to systems that are secured and drained.

6.5.4.2 At pipe supports, remove only enough insulation to provide a snug fit. Fill voids between insulation and support with tightly packed fibrous glass felt, conforming with MIL-I-16411, Type II, to within \(\frac{1}{4}\) in. (6 mm) of the insulation surface. Fill the remainder with end-sealing compound, conforming with MIL-C-22395, overlapping both the support member and the adjacent insulation. Lag and coat with the same materials as the adjacent pipe.

\(^{4}\) Thickness of fiberglass felt, in accordance with MIL-I-16411, Type II.

\(^{5}\) Thickness of 8–lb/ft\(^3\) (128–kg/m\(^3\)) refractory fiber blanket in accordance with Specification C 892, Grade 8.

\(^{6}\) Thickness of 6–lb/ft\(^3\) (96–kg/m\(^3\)) refractory fiber blanket in accordance with Specification C 892, Grade 6.
6.6 Weather-Exposed Piping, Temperature Range from 41 to 450°F (5 to 232°C)—Use for hot piping systems exposed to weather.

6.6.1 For insulation and lagging materials, see Table 2.

6.6.2 For insulation thickness, see Table 4, Table 7, Table 8, or Table 9.

6.6.3 For installation details, see Fig. 3, Fig. 7, or Fig. 8.

6.6.4 Special Conditions:

6.6.4.1 Piping exposed to the weather shall be effectively insulated against freezing. The thickness of insulation required to prevent freezing is determined by calculation based on the system fluid, system velocity, type of insulation to be used, and climatic conditions involved. This does not apply to systems that are secured and drained.

6.6.4.2 At pipe supports, remove only enough insulation to provide a snug fit. Fill voids between the insulation and support with tightly packed fibrous glass felt, conforming with MIL-I-16411, Type II, to within 1/4 in. (6 mm) of the insulation surface. Fill the remainder with end-sealing compound, conforming with MIL-C-22395, overlapping both the support member and the adjacent insulation. Lag and coat with the same materials as the adjacent pipe.

7. Selection Requirements, Machinery and Equipment

7.1 Temperature Range from −20 to +40°F (−29 to +4°C)—Use for refrigerant and other equipment within the temperature range.

7.1.1 For insulation and lagging materials, see Table 3.

7.1.2 For insulation thickness, see Table 11.

7.1.3 For installation details, see Fig. 9, Fig. 10, or Fig. 11, as applicable.

7.2 Temperature Range from 41 to 125°F (5 to 52°C)—Use for low-temperature machinery and equipment within the temperature range.

7.2.1 For insulation and lagging materials, see Table 3.

7.2.2 For insulation thickness, see Table 11.

7.2.3 For installation details, see Fig. 9, Fig. 10, Fig. 11, or Fig. 12, as applicable.

7.2.4 Special Conditions—Machinery or equipment operating in this temperature range does not require insulation except where damage or discomfort will result from condensation.

7.3 Temperature Range from 126 to 1200°F (52 to 649°C)—Use for medium- and high-temperature machinery and equipment within the temperature range.

7.3.1 For insulation and lagging materials, see Table 3.

7.3.2 For insulation thickness, see Table 12.

7.3.3 For installation details, see Fig. 10, Fig. 11, Fig. 12, Fig. 13, or Fig. 14, as applicable.

8. Insulation and Lagging Requirements for Removable Covers for Valves, Fittings, Flanges, and Machinery or Equipment

8.1 Removable Covers—Flanged valves and fittings and pipeline flanges shall have removable covers to permit servicing of takedown joints.
8.1.1 Removable covers shall be manufactured using materials specified in 8.2-8.4 and to thicknesses specified in Tables 4-7. Stitching, lacing, and quilting (required to prevent sagging) shall be accomplished with materials specified in 8.5 and as shown in Figs. 15-17.

8.1.2 Removable covers are also be manufactured from segments of block insulation or from preformed sectional pipe covering and molded (premolded) components. When a removable cover is made of segments of block insulation or preformed (premolded) sectional pipe covering, it shall be of the same material and thickness as the adjoining pipe insulation.

8.2 Filler Materials for Removable Blankets:
8.2.1 Fibrous glass felt, conforming with MIL-I-16411, Type II.
8.2.2 Refractory fiber blanket, in accordance with Specification C 892, Grade 8.
8.2.3 Refractory fiber blanket, also in accordance with Specification C 892, Grade 6.
8.2.4 Mineral fiber blanket, in accordance with Specification C 612, Class 4.

8.3 Covering or Encapsulating Materials for Removable Blankets:
8.3.1 For surface temperatures 450°F (232°C) and below, the filler shall be encapsulated with fiberglass cloth, conforming with MIL-C-20079, Type I, Class 9 (see Fig. 18, Detail A).
8.3.2 For surface temperatures above 450°F (232°C), the entire outside surface shall be encapsulated with TY304 stainless steel wire mesh, 0.011-in. (0.25 mm) diameter, No. 60 density, and crimped (see Fig. 18, Detail B). Alternatively, the entire outside
surface shall be encapsulated with fiberglass cloth, inserted with stainless steel reinforcement, in accordance with HH-P-31, Type I, Class 1.

8.3.3 The cold or top side of the surface shall be covered with fiberglass cloth, conforming with MIL-C-20079, Type I, Class 9. The bottom and side surface areas shall be covered as follows:

8.3.3.1 Fiberglass cloth, shall be inserted with stainless steel wire reinforcement, conforming with HH-P-31, Type I, Class 1 (see Fig. 18, Detail C); or

8.3.3.2 Fiberglass cloth, conforming with MIL-C-20079, Type I, Class 9, with TY304 stainless steel wire mesh, 0.008-in. (0.21-mm) diameter and No. 60 density, shall be crimped sewn onto the fibrous cloth (see Fig. 18, Detail D); or

8.3.3.3 TY304 stainless steel wire mesh, 0.011-in. (0.25-mm) diameter and No. 60 density, shall be crimped (see Fig. 18, Detail E).

8.4 Alternative Covering Materials (for surface temperatures 450°F (232°C) and below, and for cold or top-side covering for temperatures above 450°F), are provided for removable blankets to be used in areas exposed to weather or where liquid penetration

FIG. 2 Installation of Elastomeric Foamed Plastic Insulation (MIL-P-15280 or EB 4013)
8.4.1 Silicone-impregnated fiberglass cloth,
8.4.2 Silicone-impregnated fiberglass cloth with aluminized facing on one side, and
8.4.3 Fiberglass cloth with aluminum or stainless steel facing laminated to one side.

8.5 Hardware and Accessory Items for Removable Blanket Construction—Necessary items shall include blanket lacing devices, blanket quilting devices, stitching materials, and installation materials.

8.5.1 Blanket Lacing Devices:
8.5.1.1 TY304 stainless steel lacing rings with lacing washers (see Fig. 19).
8.5.1.2 TY304 stainless steel lacing hooks with lacing washers (see Fig. 20).
8.5.1.3 TY303 stainless steel lacing capstan assembly sets (see Fig. 21).
8.5.1.4 TY304 stainless steel mechanical hook sets (see Fig. 22).

8.5.2 Blanket Quilting Devices:
8.5.2.1 TY304 stainless steel mechanical quilt sets (see Fig. 23).
8.5.2.2 TY304 stainless steel lacing washers with lacing wire (see Fig. 23).

8.5.3 Stitching Materials:

FIG. 3 Installation of Polyimide Foam Insulation (Specification C 1482)
8.5.3.1 TY304 stainless steel hog rings.

8.5.3.2 TY304 stainless steel thread (0.011-in. (0.25-mm) diameter).

8.5.3.3 TY304 stainless steel staples.

8.5.3.4 Fiberglass thread (plain, polytetrafluoroethylene coated and wire inserted with monel or TY304 stainless steel, or both).

8.5.4 Installation Materials:

8.5.4.1 No. 18 gage copper lacing wire.

8.5.4.2 No. 18 gage soft or annealed TY304 stainless steel lacing wire.

8.5.4.3 No. 18 gage galvanized iron lacing wire.

8.5.4.4 TY304 stainless steel hog rings (particularly for installing thermal tape, refer also to Section 9).

8.6 Special Conditions:

8.6.1 Reuseable covers for machinery and equipment shall be fabricated from materials specified in Tables 14-17, in accordance with methods shown in Fig. 18 and configured to suit the specific application.

8.6.2 Unfired pressure vessels with butt welded inserts for which periodic radiographic inspection of the joint is required shall have removable reuseable covers installed over the insert. These covers shall extend 4 in. (100 mm) beyond the weld joint.

8.6.3 Removable covers shall not be used on systems insulated with elastomeric-foamed plastic insulation.
8.6.4 Services subject to frequent maintenance, such as reducing and regulating valves, shall be provided with easily removed and replaced tailored pads.

8.6.5 Removable blankets shall not be used on cold systems (below ambient) or on systems where a vapor barrier is required.

8.6.6 When stitching two or more covering or encapsulating materials together, stainless steel staples, hog rings, 0.011-in. (0.25-mm) diameter stitching wire, or fiberglass thread (plain or wire inserted) shall be used.

8.6.7 All construction details apply to removable blankets for flanges, valves, machinery and equipment, and other miscellaneous areas as determined by the specifier.

8.6.8 When installing removable blankets on valves, flanges, and various pieces of equipment, note that all void areas behind the insulation blanket are to be filled. The total required thickness of insulation shall not be achieved by including a loose wrap of fibrous glass felt or refractory fiber blanket as part of the required thickness.

9. Requirements for Thermal Insulating Tape

9.1 Thermal Insulating Tape—Is capable of being applied to pipe, sizes ¼ in. (8 mm) to ½ in. (20 mm), for temperatures between 125 and 150°F (52 and 66°C) using materials specified in Section 8 and to thicknesses specified in Table 14. For manufacturing and installation details, see Fig. 6.

9.2 Filler Materials for Thermal Insulating Tape —See 8.2.
9.3 Covering or Encapsulating Materials for Thermal Insulating Tape:

9.3.1 For surface temperatures below 220°F (105°C), the entire outside surface shall be encapsulated with fiberglass cloth, conforming with MIL-C-20079, Type I, Class 3.

9.3.2 For surface temperatures 220 to 450°F (105 to 232°C), the entire outside surface shall be encapsulated with fiberglass cloth, conforming with MIL-C-20079, Type I, Class 9.

9.3.3 For surface temperatures above 450°F (232°C), the entire outside surface shall be encapsulated with fiberglass cloth, conforming with MIL-C-20079, Type I, Class 9, with an inner jacket of TY304 stainless steel wire mesh, 0.008-in. (0.21-mm) diameter, No. 60 density and crimped. Alternatively, the entire outside surface shall be encapsulated with fiberglass cloth, inserted with stainless steel wire reinforcement, in accordance with HH-P-31, Type I, Class 1.

9.4 Hardware and Accessory Items for Thermal Insulating Construction—See 8.5.
Coat all mating surfaces of insulation with vapor retarder compound MIL-C-22395.

Multiple layers shall have staggered joints.

Install insulation with all ends butted together.

Secure insulation in place with fibrous glass tape as necessary, three strips per section, overlapping a minimum of 50%.

Coat the outside surface of insulation with MIL-A 3316, Class 1 Adhesive coating in accordance with USCG 164-012 & 164.112. Cover with fibrous glass cloth lagging while still wet or lag with MIL-C-20079 fibrous glass cloth coated with re-wettable adhesive.

Coat outside surface of lagging with weather resistant insulation seal.

As an alternate to fibrous cloth lagging, metal lagging similar to that specified in Table 13 shall be used.

See FIG. 16 for bolting allowance in way of flanged, takedown joints.

FIG. 7 Installation of Cellular Glass Pipe Insulation (Specification C 552) in the Weather

9.5 Special Conditions—See 8.6.
10. Keywords

10.1 insulation; lagging; machinery insulation; marine; piping insulation; ship; shipboard insulation; thermal insulation; vessel
FIG. 9 Installation of Cellular (Foamed) Glass Insulation (Specification C 552) on Machinery and Equipment

Install sections of Cellular Glass Insulation (Specification C 552) with all joints staggered, tightly butted and coated with Adhesive Cement MIL-A-3316, Class I.

Secure insulation in place with wire, stainless steel bands or welded studs (where allowable), as necessary.

Coat outside surface of insulation with Adhesive Cement MIL-A-3316, Class I, and cover with fibrous glass cloth lagging while adhesive is still wet. Note: Is capable of being lagged with MIL-C-20079 fibrous glass cloth coated with re-wettable adhesive.

Coat outside surface of lagging with Vapor Retarder Compound MIL-C-19565, Type II when used for anti-sweat applications.

Machinery or equipment.

FIG. 9 Installation of Cellular (Foamed) Glass Insulation (Specification C 552) on Machinery and Equipment

FIG. 10 Installation of Elastomeric Foamed Plastic Insulation (MIL-P-15280 or EB 4013) on Machinery or Equipment

Machinery or Equipment

Install Elastomeric Foamed Plastic Insulation (MIL-P-15280, Form S or EB 4013) with all joints staggered, tightly butted and secured with MIL-A-24179 Adhesive.

Insulation is capable of being applied in 1/4-in. (6mm) thick minimum layers as necessary to build up the required thickness.

Application of a vapor retarder is not required on Elastomeric Foamed Plastic Insulation.

Elastomeric Foamed Plastic Insulation shall be coated with Adhesive MIL-A-3316, Class I and covered with glass cloth only in areas where it is subject to damage.

Note: Is capable of being lagged with MIL-C-20079 fibrous glass cloth coated with re-wettable adhesive.

FIG. 10 Installation of Elastomeric Foamed Plastic Insulation (MIL-P-15280 or EB 4013) on Machinery or Equipment
Install Polyimide Foam Insulation (C 1482, Type I) with all joints staggered, tightly butted, and secured with MIL-A-24179 Adhesive.

When used in the temperature range 100 to 400°F (38 to 204°C), shall be coated on outside surface with adhesive in accordance with MIL-A-3316 and cover with fibrous cloth lagging while the adhesive is still wet.

For anti-sweat treatments, use one of the following vapor retarder systems:

Coat outside surface of the insulation with MIL-A-3316 Adhesive and cover with fibrous glass cloth lagging while the adhesive is still wet. Paint with vapor retarder compound MIL-C-19565, Type II. Ensure that a continuous vapor retarder is achieved.

Aluminized polyester/aluminum foil shall be adhered to outer surface of the insulation using an adhesive conforming to the fire resistance requirements of MIL-A-3316. All joints and seams shall be sealed with 0.002 in. (0.0525 mm) aluminum pressure sensitive tape. Coat outside surfaces of aluminized polyester/aluminum foil with MIL-A-3316 Adhesive and cover with fibrous glass cloth lagging while the adhesive is still wet.

FIG. 11 Installation of Polyimide Foam Insulation (Specification C 1482, Type I) on Machinery and Equipment

FIG. 12 Installation of Mineral Fiber Blanket or Felt Insulation (Specification C 553) on Machinery or Equipment (400°F Max) (204°C)
FIG. 13 Installation of Thermal Fibrous Glass Felt Insulation (MIL-I-16411) or Refractory Fiber Blanket Insulation (Specification C 892) on Machinery and Equipment (126 to 1200°F) (52 to 649°C)

Machinery or equipment

Install Thermal Fibrous Glass Insulation Felt MIL-I-16411, Type II, or Refractory Filler Blanket Specification C 892. Insulation is applied in multiple layers to build up to the required thickness.

Secure insulation in place with wire, stainless steel bands, or welded studs (where allowable) as necessary.

Spread galvanized iron wire netting 1-in. (25 mm) mesh over insulation and secure with wire as necessary.

Apply a 1/2-in. (13 mm) thick coating of Finishing Cement Specification C 449 over wire mesh netting allowing 24 h drying time.

Coat the above with Adhesive Cement MIL-A-3316, Class I, and cover with fibrous glass cloth lagging while adhesive is still wet. Note: capable of being lagged with MIL-C-20079 fibrous glass cloth coated with rewetable adhesive.

FIG. 14 Installation of Thermal Insulation Block (Calcium Silicate) (Specification C 533) or Perlite (Specification C 610) on Machinery and Equipment

Machinery or equipment

Install Thermal Insulation Block (Calcium Silicate) Specification C 533 or Perlite Specification C 610.

Insulation shall be installed in two layers when the temperature is over 600 degrees F (316 degrees C). All joints shall be butted together and staggered.

Secure insulation in place with wire, stainless steel bands, or welded studs (where allowable) as necessary.

Spread galvanized iron wire netting 1-in. (25 mm) mesh over insulation and secure with wire as necessary.

Apply a 1/2-in. (13 mm) thick coating of Finishing Cement Specification C 449 over wire mesh netting allowing 24 h drying time.

Coat the above with Adhesive MIL-A-3316, Class I, and cover with fibrous glass cloth lagging while adhesive is still wet. Alternatively, is capable of being lagged with MIL-C-20079 rewetable fibrous glass cloth.

On vertical equipment, the bottom course of block insulation shall be supported by an angle iron run horizontally along the base. The horizontal leg of the angle shall be 1/2-in. (13 mm) less in length than the thickness of the insulation used.
FIG. 15 Installation of Removable Covers for Valves, Fittings, and Flanges

FIG. 16 Typical Removable Flange Cover in Which Flange Diameter is Larger Than the Outside Diameter of the Adjacent Pipe Covering
FIG. 17 Typical Removable Flange Cover in Which Flange Diameter is Smaller Than the Outside Diameter of the Adjacent Pipe Covering

Fill void with allowable felt or material insulation specified in Section 8 and secure in 0.060-in. (0.152mm) diameter Type 304 stainless steel wire mesh or FG-2-31, Type 1 wire reinforced fibrous glass cloth.

NOTE 1—For surface temperatures 450°F (232°C) and below.

NOTE 2—For surface temperatures above 450°F (232°C).

S1. Supplemental Requirements and Exceptions to the Requirements of Practice F 683 for Ships of the U.S. Navy

S1.1 The U.S. Navy vessel insulation shall be installed in accordance with details in NAVSHIPS Drawings 804-5959214, 804-5959212, and Naval Ships Technical Manual, Chapter 635. Insulation details in this practice are for guidance only.

S1.1.1 Materials and their thicknesses approved for insulation and lagging for specific applications and temperature ranges are specified in Tables S1.1 and S1.2.

S1.2 Ceramic fiber insulation (Specification C 892) shall not be installed aboard vessel in accordance with COMNAVSEA-SYSCOM message R 131446Z NOV 86 ZYB, unless there presently are no NAVSEA-approved substitutes for a specific application. Where previously installed ceramic (refractory) fiber insulation or lagging materials containing ceramic (refractory) fibers are removed, restoration shall be with materials free of ceramic (refractory) fibers unless there are no NAVSEA-approved substitutes identified for a specific application.

S1.3 Cellular glass block and pipe thermal insulation (Specification C 552) shall not be used.

S1.4 Mineral fiber blanket and felt insulation (Specification C 553) shall not be used. For U.S. Navy applications, use MIL-I-2818 in accordance with Table S1.3. For passive fire protection applications, refer to NAVSEA Drawing No. 803-5184182.

S1.5 Mineral fiber preformed pipe insulation (Specification C 547) shall not be used. Insulate in accordance with Table S1.4.

S1.6 Fibrous glass pipe insulation shall be as specified in MIL-I-22344 and shall be used only on piping no greater than 1-in. NPS (25 mm) with maximum temperature limit of 370°F (188°C) in place of Specification C 547, Type 2. See Table S1.4 for restrictions on this material’s use.

S1.7 Calcium silicate block and thermal insulation shall be as specified in MIL-I-2819 and MIL-I-2781, respectively, in place of Specification C 533. Insulate in accordance with Tables S1.3 and S1.5.

S1.8 Mineral fiber block and board thermal insulation (Specification C 612) shall not be used.

S1.9 The requirements of 5.4, 5.7, and 5.10 do not apply to U.S. Navy vessels.

S1.10 Thermal insulating tape in accordance with Fig. 5 shall be used only on a temporary basis, such as repair of insulation while the vessel is at sea. Apply in accordance with Table S1.6.

S1.11 Cloth and tape lagging shall be painted after installation with one coat of nonflaming paint conforming to formula No. 124 of DoD-E-24607 or water base DoD-C-24596 or Navy formula 25A, if necessary for appearance. Unlagged insulation
conforming to EB Specification 4013 shall be sealed with one coat of Devoe and Raynolds “DEVLEX 601” or Ocean 9788, or water-base DoD-C-24596 or Navy formula 25A.

S1.12 The use of “other materials” (provided the requirements of this practice are satisfied) does not apply to U.S. Navy vessels. See 4.1, Footnote B to Table 1, Footnote A to Table 2, and Footnote B to Table 3.

S1.13 Footnote A to Table 1 and Table 3 does not apply to U.S. Navy vessels.

S1.14 MIL-P-15280 shall not be used on naval vessels; alternatives are as follows:

S1.14.1 For Temperature Ranges:

- **20 to 100°F (29 to 38°C)**
  - EB 4013
  - EB 4013 and DoD-I-24688, Type I and
    - MIL-I-22344 (see Tables S1.4 and S1.6)
  - EB 4013 and DoD-I-24688, Type I and
  - MIL-I-22344 (see Tables S1.4 and S1.6)

- **100 to 180°F (39 to 82°C)**
  - EB 4013
  - EB 4013 and DoD-I-24688, Type I and
    - MIL-I-22344 (see Tables S1.4 and S1.6)
  - EB 4013 and DoD-I-24688, Type I and
  - MIL-I-22344 (see Tables S1.4 and S1.6)

- **180 to 370°F (83 to 188°C)**
  - DoD-I-24688, Type I and MIL-I-22344
  - (see Tables S1.4 and S1.6)

S1.15 The U.S. Navy limits the use of polyimide foam to 400°F (204°C).
For repair or replacement of piping and machinery insulation, only the materials specified herein shall be used. Procedures for the repair and replacement of insulation are contained in Naval Ships Technical Manual (NSTM), Chapter 635.

S1.16 Special Conditions—The following special conditions supplement or modify the selection of materials or thicknesses specified, when applicable:

S1.16.1 The insulation thickness on soot blower piping between the root valve and the soot blower heads shall be reduced to one half that indicated for a system normally at the same temperature.

S1.16.2 For repair or replacement of piping and machinery insulation, only the materials specified herein shall be used.
S1.16.4 Adhesives containing halogenated solvents shall not be used for submarine applications.

S1.16.5 Insulation shall not be installed on 2 ft of pipe immediately upstream of thermostatic steam traps, complying with MIL-T-2118. A removable cover, consisting of two layers of glass cloth, shall be installed over the uninsulated pipe and the thermostatic trap.

S1.16.6 Small diameter hot piping, 1⁄2-in (15-mm) nominal pipe size (NPS) and under shall not be insulated when the operating temperatures are less than 125°F (52°C).

S1.16.7 Shielding on uninsulated hot pipes shall be provided only where such pipes are readily accessible to contact with personnel.

S1.16.8 MIL-I-2781 shall be used in “high traffic” areas on hot piping whose design temperature is greater than 180°F (82°C). “High traffic” areas are those areas in which the installed insulation and lagging are subject to wear and damage during routine operations. Alternatively, DoD-I-24688 is capable of being used on hot piping in “high traffic” areas that are in a vertical orientation.

### TABLE S1.4 Thickness of Insulation Conforming to EB Specification 4013, DoD-I-24688, and MIL-I-22344, for Hot Piping

<sup>A</sup> Does not include finishing cement.

<sup>B</sup> Wherever possible, double layers shall be used where temperatures exceed 600°F (316°C). Double layers are capable of being used at temperatures below 316°F.
S1.16.9 These insulation materials shall not be used on austenitic stainless steel components without a corrosion study.

S1.17 Adhesives:

S1.17.1 Adhesives conforming to MIL-A-3316 shall be used for fastening fibrous glass cloth and tape lagging only in inaccessible areas or where rewettable lagging cannot be applied. The MIL-C-20079, Type I, Class 6 and 8 fibrous glass cloth with pre-applied rewettable adhesive manufactured by BGF Industries, 3802 Robert Porcher Way, Greensboro, NC 27410 or Alpha Maritex Style 2014/9485 RW manufactured by Alpha Associates is an alternative and preferred system to the fibrous glass cloth adhered with MIL-A-3316 adhesive for lagging. However, it shall not be used for areas subject to live steam or dampness.

S1.17.2 Rubatex R373 and Armacell 520 are the only adhesives to secure EB Specification 4013 insulation to itself and to metals for surface ships and submarines.

S1.17.3 Sodium silicate solution, Specification D 3400, shall be used as an adhesive for joining segments of calcium silicate preformed pipe insulation in accordance with MIL-I-2781.

S1.18 Finishing/Insulation Cements—Where finishing and insulating cements are specified, any of the following materials are acceptable. Before use, material compatibility with the proposed application will be verified.

S1.18.1 Hydraulic-setting mineral fiber finishing and insulating cement in accordance with Specification C 449/C 449M.

S1.19 Metal Lagging—Where metal lagging is required, any of the following materials are acceptable, except for uptake applications (see S1.25.4.1):

S1.20 Fasteners—Insulation shall be held in place by suitable wire or flat metal bands. The welding of fasteners to machinery, piping, pressure vessels, or other related equipment is prohibited. Where fasteners are necessary, they shall be attached during manufacture (before heat treatment, stress relief, and testing) by a NAVSEA-approved procedure.

S1.21 Hot-Surface Insulation Covers—To ensure that the pipe covering will not interfere with the servicing of a takedown joint where a reusable cover is installed, the permanent insulation shall stop short of the takedown joint and a short removable and reusable section of insulation shall be installed between the permanent insulation and the takedown joint. The insulation joint formed by the permanent and reusable sections shall be square, or at an angle of 45°. The reusable section shall fit tightly at the interfacing joint without gaps and shall be held in place with removable pins, clips, wire, or bands to maintain a tight joint.

S1.22 Construction—For sizes larger than 2-in. (50-mm) NPS, valve bonnets and valves having takedown joints at the ends shall be fitted with reusable covers such that the bonnet joint is capable of being removed independently of the valve covering. Valves, not greater than or equal to 2-in. NPS, shall be fitted with separate covers as indicated previously, or covers of a one-piece design such that they shall be wrapped around the entire valve body and clipped or otherwise secured just below the packing gland on the valve stem. The packing gland shall remain visible.

S1.23 Fabrication, Piping Components—For piping components except as otherwise specified, any one of the following methods of fabrication is acceptable.

S1.23.1 Covers for Piping Components—Covers that are exposed to temperatures under 450°F (232°C) are capable of being made in two half sections, using fibrous glass felt in accordance with MIL-I-16411 enclosed in fibrous glass fabric conforming to
Covers Formed from Block Insulation—

Covers shall be made of segments of block insulation or preformed pipe insulation, having the same thickness as that on the adjacent piping. Blocks shall be securely wired to frames of 1/2-in. square mesh, 300 Series stainless steel wire with a diameter of 0.0403 in. (1.024 mm). Wire mesh frames inside and outside of blocks shall have ends bent over and joints secured with Number 18 gage black annealed iron wire woven through the mesh. High-temperature cement in accordance with MIL-C-2861 shall be troweled smoothly over all surfaces of the wire mesh. Fibrous glass felt in accordance with MIL-I-16411 shall be used to build up covers when the flange diameter is larger than the outside diameter of the adjacent pipe covering. Covers shall be tightly and smoothly lagged to envelop the outside and ends, using fibrous glass cloth conforming to MIL-C-20079, Type I, Class 9. Lagging shall be either cemented or sewn on, except the ends of covers, which shall always be sewn. Where double-layer insulation is used, the two sections of the cover shall be fitted together with a scarfed joint. Such joints shall be straight and true to reduce heat loss. Bands; eyelets or locks of galvanized steel; or lacing with hooks, rings, washers, and wire shall be used to secure the covers.

Preformed Covers—Preformed fibrous glass or polyimide foam, DoD-I-24688, Type I valve or fitting covers shall be used when temperatures are in the 125 to 400°F (52 to 204°C) range. These shall be of the same thickness as the adjacent pipe covering. Such covers, when used, shall be lagger independently of the pipe covering and in a manner that will facilitate removal and replacement.

Fabrication, Machinery, and Equipment—Covers shall be made of segments of block insulation or preformed pipe insulation, having the same thickness as that on the adjacent piping. Blocks shall be securely wired to frames of 1/2-in. square mesh, 300 Series stainless steel wire with a diameter of 0.0403 in. (1.024 mm). Wire mesh frames inside and outside of blocks shall have ends bent over and joints secured with Number 18 gage black annealed iron wire woven through the mesh. High-temperature cement in accordance with MIL-C-2861 shall be troweled smoothly over all surfaces of the wire mesh. Fibrous glass felt in accordance with MIL-I-16411 shall be used to build up covers when the flange diameter is larger than the outside diameter of the adjacent pipe covering. Covers shall be tightly and smoothly lagged to envelop the outside and ends, using fibrous glass cloth conforming to MIL-C-20079, Type I, Class 9. Lagging shall be either cemented or sewn on, except the ends of covers, which shall always be sewn. Where double-layer insulation is used, the two sections of the cover shall be fitted together with a scarfed joint. Such joints shall be straight and true to reduce heat loss. Bands; eyelets or locks of galvanized steel; or lacing with hooks, rings, washers, and wire shall be used to secure the covers.

Heat-Surface Insulation:

Pipe and Tubing—Each layer of molded insulation shall be installed with joints butted together. Where two layers are

*MIL-C-20079, Type I, Class 9. Alternatively, silicone rubber-coated, or silicone rubber/aluminized glass fabric is capable of being substituted for plain fibrous glass fabric for the cover material. Covers that are exposed to temperatures of 450°F (232°C) and over shall have a 0.008-in. (0.203-mm) diameter knitted stainless steel wire mesh sewn on to the fibrous glass cloth on the inside (hot) surface and on the ends. Alternatively, the inside surface and ends of pads shall be fabricated of wire-reinforced fibrous glass cloth conforming to HH-P-3 I, Type I, Class I. Each half cover shall be sewn and quilted with polytetrafluoroethylene (PTFE) coated fibrous glass yarn conforming to MIL-C-20079, Type III, Classes 3, 4, or 6 for hand sewing or PTFE-coated fibrous glass sewing thread (fully sintered), Type III, Class 3, 5, or 6 for machine sewing. The covers are also capable of being fastened by mechanical stapling with galvanized or stainless steel staples in a manner to provide uniform thickness, strength, and rigidity.

*S1.23.1.1 Wire Mesh—Knitted wire mesh shall be of 304 annealed stainless steel. The wire shall be 0.008-in. diameter. The mesh shall consist of 71/2 ± 1/2 in. (188 ± 13 mm) courses per inch equal spacing and 10 ± 1 wales per inch equal (3.9 ± 0.5 wales per cm) spacing. The mesh shall be furnished in 30 ± 1/2 in. (750 mm ± 13 mm) flattened tubular form and shall be crimped 0.125 to 0.150 in. (3.18 to 3.81 mm) deep by 3/4 in. (7.94 mm) crimp to crimp.

S1.23.2 Preformed Covers—Preformed fibrous glass or polyimide foam, DoD-I-24688, Type I valve or fitting covers shall be used when temperatures are in the 125 to 400°F (52 to 204°C) range. These shall be of the same thickness as the adjacent pipe covering. Such covers, when used, shall be lagger independently of the pipe covering and in a manner that will facilitate removal and replacement.

S1.23.3 Block and Preformed Insulation—Covers shall be made of segments of block insulation or preformed pipe insulation, having the same thickness as that on the adjacent piping. Blocks shall be securely wired to frames of 1/2-in. square mesh, 300 Series stainless steel wire with a diameter of 0.0403 in. (1.024 mm). Wire mesh frames inside and outside of blocks shall have ends bent over and joints secured with Number 18 gage black annealed iron wire woven through the mesh. High-temperature cement in accordance with MIL-C-2861 shall be troweled smoothly over all surfaces of the wire mesh. Fibrous glass felt in accordance with MIL-I-16411 shall be used to build up covers when the flange diameter is larger than the outside diameter of the adjacent pipe covering. Covers shall be tightly and smoothly lagged to envelop the outside and ends, using fibrous glass cloth conforming to MIL-C-20079, Type I, Class 9. Lagging shall be either cemented or sewn on, except the ends of covers, which shall always be sewn. Where double-layer insulation is used, the two sections of the cover shall be fitted together with a scarfed joint. Such joints shall be straight and true to reduce heat loss. Bands; eyelets or locks of galvanized steel; or lacing with hooks, rings, washers, and wire shall be used to secure the covers.

S1.23.4 Felt—When installing the preceding covers, spaces between inner surfaces of covers for flanges and other irregular surfaces shall be filled with pieces of fibrous glass insulation felt in accordance with MIL-I-16411. Felt shall be packed loosely enough to preserve air cell structure and tightly enough to prevent air circulation.

S1.23.5 Mineral Fiber (Rock/Slag)—Preformed mineral fiber (rock/slag) insulation with a hard fibrous glass cover (CADAFIT 1200°F [649°C]) or the equivalent is capable of being used as applicable. For the appropriate thickness of CADAFIT 1200°F or the equivalent mineral fiber (rock/slag) insulation, refer to the thicknesses shown in Table S1.2 at the appropriate temperature range.

S1.24 Fabrication, Machinery, and Equipment—For reusable covers for machinery and equipment, either of the following methods of fabrication is acceptable.

S1.24.1 Machinery and Equipment Covers—Covers similar to fibrous glass felt in accordance with MIL-I-16411 described for piping components (see S1.23.1).

S1.24.2 Covers Formed from Block Insulation—Covers made in sections formed of insulating block held together with wire and adhesive cement, covered with 1/2-in. (13-mm) thickness of finishing cement, Specification C 449/C 449M and lagged. Lacing with hooks, rings, washers, and wire or brass snap fasteners shall be used to secure the covers.

S1.24.3 Semiremovable Turbine Covers—Semiremovable turbine casing flange covers are capable of being installed as an alternative for removable covers previously specified. The permanent insulation shall be run to the casing flange, allowing for bolt removal space. The flange and bolts shall be covered with (1) fibrous glass cloth in accordance with MIL-C-20079, Type I; (2) wire inserted fibrous glass cloth in accordance with HH-P-3 I, Type I, Class 1; or (3) knitted wire mesh, as required by operating temperature. The chosen cover shall be secured to the bolts with wire. The flange shall then be insulated with fibrous glass felt in accordance with MIL-I-16411, mineral wool felt in accordance with MIL-I-2818, or insulation block in accordance with MIL-I-2819, Class 2 to the required thickness and shape. The insulation shall then be lagged with fibrous glass cloth, which shall be carried over the outer edge of the permanent insulation and secured with adhesive. The semiremovable cover shall then be sealed with adhesive in accordance with MIL-A-3316, Class 1, and painted.

S1.25 Hot-Surface Insulation:

S1.25.1 Pipe and Tubing—Each layer of molded insulation shall be installed with joints butted together. Where two layers are
used, joints shall be staggered. Not less than three fastenings shall be used to secure each 3-ft section of insulation. Fastening shall be Number 18 gage minimum (0.049-in. [1.245-mm] diameter) annealed black iron or 300 Series stainless steel wire with a diameter of 0.0403-in. (1.024-mm) wire or flat steel bands. Except as otherwise specified, lagging shall be installed over the insulation.

S1.25.1.1 Preformed Polyimide Pipe Covers—Preformed polyimide pipe covering conforming to DoD-I-24688, Type I, shall be lagged or prelagged with MIL-C-20079 fibrous glass cloth facing on piping systems whose design temperature is between 100 and 400°F (38 to 204°C).

S1.25.1.2 Soot Blower Piping—The installation of soot blower piping insulation shall be in accordance with Drawing 804-841336.

S1.25.2 Piping Components—Valves, fittings, and accessories with welded and brazed fittings including unions, shall be insulated and lagged similarly to adjacent piping.

S1.25.2.1 Block, Felt, Molded Insulating Materials—Block or felt insulating materials, or molded pipe insulation secured with hot-dipped galvanized iron or steel wire, shall be used. When insulating felts are used, the inner layer shall be fibrous glass felt conforming to MIL-I-16411. Galvanized iron or steel wire netting, Number 18 gage minimum (0.049-in. [1.245-mm] diameter), shall be spread over the insulating material and secured with wire. Insulating cement shall be used to fill crevices, smooth surfaces, and completely cover the wire netting. A ½-in. (13-mm) thickness of finishing cement shall then be applied. Alternatively, wire netting shall be omitted where the size of the installation does not require netting to hold the insulation cement in place during the installation process. For these installations, glass cloth shall be installed over the previously finished insulation material without the intermediate layer of wire mesh. Insulating material shall be the same thickness as that on adjacent piping.

S1.25.2.2 Reusable Covers—Reusable covers shall be fitted where required.

S1.25.3 Machinery and Equipment—For machinery and equipment, block, felt, or blanket insulating materials of the required thickness shall be secured with “GB” (galvanized before weaving) iron wire, “GB” galvanized iron wire netting, 1-in. (25-mm) mesh and 20- to 22-gage minimum (0.88- to 0.73-mm diameter), shall be spread over the surface and secured by wire. Insulating cement shall be used to fill crevices, smooth surfaces, and completely cover the wire netting. Use stainless steel wire netting, Type 304 (20 gage) for temperatures above 370°F (188°C).

S1.25.3.1 Use of Finishing Cement—When no insulating cement has been specified, a ½-in. (13-mm) thickness of finishing cement shall be applied.

S1.25.3.2 Insulating Cement—When insulating cement has been specified, it shall be applied in successive layers, ½ to 1 in. (13 to 25 mm) in thickness, until the total thickness specified has been reached. Wire netting, similar to that used for covering the insulating materials shall be installed between layers. A ½-in. (13-mm) thickness of finishing cement shall be applied over the last layer of insulating cement.

S1.25.3.3 Lagging—Lagging shall be installed over finishing cement. Reusable covers shall be installed where required.

S1.25.3.4 Fastenings—Clips, hooks, or other fastenings for securing insulation or lagging shall not be brazed or welded to nonferrous parts of distilling plants or deaerating feed tanks.

S1.25.4 Boiler Uptakes—Boiler uptake thermal insulation shall be insulated with either mineral wool felt in accordance with MIL-I-2818 or fibrous glass felt in accordance with MIL-I-16411. If acoustic absorptive treatment is found to be necessary to decrease the noise level, the insulation thickness shall be increased accordingly.

S1.25.4.1 Metal Lagging—Metal lagging for uptakes shall be galvanized sheet steel conforming to Specification A 653/A 653M Coating Designation G-115, not less than ½ in. (0.794 mm) thick.

S1.25.4.2 Exceptions—Insulation and lagging is not required on uptakes above the weather deck, except where the transfer of heat to spaces adjacent to the uptake area is objectionable.

S1.25.5 Unfired Pressure Vessels—Unfired pressure vessels, including catapult wet accumulators, shall be covered with block insulation, MIL-I-2819, or fibrous glass felt in accordance with MIL-I-16411. Insulation shall be held in place with 18-gage galvanized wire spaced on approximately 3-in. (75-mm) centers or steel strapping spaced on not greater than 9-in (225-mm) centers. Insulation shall be covered with ½-in. (13-mm) finishing cement in accordance with Specification C 449/C 449M, lagged with fibrous glass cloth in accordance with MIL-C-20079, Type I and painted as in accordance with S1.11. Insulation in the way of vessel supports shall be metal faced to prevent insulation from wedging between the vessel and its support.

S1.25.5.1 Removable and Reusable Covers—Removable and reusable covers shall be installed over butt-welded shell inserts for which periodic radiographic inspection of the joint is required. These covers shall extend 4 in. (100 mm) beyond the welded joint.

S1.25.6 Outer Boiler Casing—If insulation is specified by pertinent ship’s specification or contract, insulation block in accordance with MIL-I-2819, Class 2, shall be secured to casing by wire netting (20- to 22-gage [0.88- to 0.73-mm diameter]), GB/galvanized, 1-in. hexangle wire mesh laced to welded notched studs on the boiler casing. Finishing cement, Specification C 449/C 449M, shall be used to fill crevices, smooth surfaces, and completely cover the netting to ½-in. (13-mm) thickness. Glass cloth conforming to MIL-C-20079, Type I, class as applicable, shall be used to lag the insulation and shall be painted in accordance with S1.11.

S1.26 Antisweat Insulation (Cold and Chilled Water Service)—Antisweat piping insulation shall consist of preformed pipe insulation conforming to EB Specification 4013. Thickness shall be ⅝ in. on all pipe sizes, except in air-conditioned spaces, where thickness shall be ½ in. (13 mm). On large pipe sizes, EB Specification 4013 insulation sheet form shall be applied in not less than
S1.27 Refrigerant Insulation—Insulation in accordance with EB Specification 4013 shall be applied in not less than \( \frac{1}{4} \)-in. (6-mm) thickness layers as necessary to build up the required thickness (tubular or sheet, as applicable). Longitudinal and butt joints shall be staggered. Joints shall be sealed using adhesive conforming to MIL-A-24179. Glass cloth lagging shall be applied over insulation in high traffic areas to protect against damage. Rewettable lagging in accordance with MIL-C-20079, Type I, Class 6 or 8, and manufactured by BGF Industries or Alpha Maritex Style 2014/9485 RW manufactured by Alpha Associates are the laggings qualified for fire performance for use with insulation conforming to EB Specification 4013.

S1.28 Weather Deck Hot Piping Insulation—Sectional preformed calcium silicate (MIL-I-2781) insulation for piping exposed to the weather shall be installed as follows:

S1.28.1 Preliminary Preparation Piping:
S1.28.1.1 All surfaces shall be clean, dry, and free of scale and grease.
S1.28.1.2 Fittings, valves, flanges, pipe supporting clamp, and not less than 3 in. (75 mm) of adjacent pipe shall be painted as follows: Apply one coat pretreatment formula 117 in accordance with DoD-C-15328 to a dry film thickness (DFT) of not greater than 0.0005 in. (0.0127 mm) (0.5 mil). After this coat dries, apply two coats of aluminum paint made by mixing 2 lb of aluminum paste in accordance with Specification D 962, with each gallon of phenolic varnish for temperatures up to 300°F (149°C). For temperatures above 300°F, apply two coats of paint conforming to TT-P-28.

S1.28.2 Installation on Pipes:
S1.28.2.1 Longitudinal joints on horizontal piping shall be on the top and bottom of the pipe; joints shall be staggered.
S1.28.2.2 Insulation shall be secured tightly to pipe with \( \frac{1}{2} \)-in. (13-mm) wide 22-gage galvanized steel bands or 18-gage galvanized iron wire on 9-in. (225-mm) centers.
S1.28.2.3 Fill all joints and voids in the insulation with high-temperature cement in accordance with MIL-C-2861. Wrap tightly with one layer of fibrous glass lagging cloth in accordance with MIL-C-20079, Type I, using adhesive in accordance with MIL-A-3316, Class 1. After the adhesive has dried, the lagging shall be coated with two brush coats of end sealing compound in accordance with MIL-C-22395.
S1.28.2.4 Where insulation is stopped off on the piping, the preformed insulation shall be tapered. The exposed surface and 3 in. (75 mm) of pipe shall be coated with sealing compound in accordance with MIL-C-22395. Fibrous glass lagging cloth, in accordance with MIL-C-20079, Type I, class as applicable, tailored to fit over the tapered insulation and exposed pipe shall be applied while the end sealing compound is still tacky. The lagging shall be attached to the insulation using adhesive in accordance with MIL-A-3316, and to the pipe with a \( \frac{1}{2} \)-in. (13-mm) wide 22-gage galvanized steel band.

S1.28.3 Installation on Fittings, Flanges, and Valves:
S1.28.3.1 Before applying flange insulation, weather deck piping shall be tested and secured in the following manner: After specified tests are completed, weather deck piping shall be subjected to alternate periods of full operating pressure, allowing pipe to come to maximum temperature, and then to zero gage pressure allowing pipe to come to ambient temperature. These cycles shall be repeated a sufficient number of times, with tightening and adjusting flanges where necessary, until no leaks are detected.
S1.28.3.2 Fittings, flanges, and valve covers shall be ship fabricated from sections of molded pipe covering block cemented together with adhesive in accordance with Specification D 3400.
S1.28.3.3 Permanent covers for fittings and valves shall be fitted snugly to fittings and adjacent pipe covering using the same material and methods as outlined for pipe covering. Voids between insulation and fitting shall be filled with tightly packed fibrous glass felt in accordance with MIL-I-16411. Permanent covers shall be lagged and coated in the same manner as the adjacent piping insulation.
S1.28.3.4 Where specified, rigid-type removable flange covers shall extend over the adjacent pipe covering \( \frac{1}{2} \) times the thickness of the insulation. The two halves of the cover shall be coated and lagged separately, using the same materials and procedure as outlined for weather deck hot pipe covering. The galvanized steel bands used to secure the two halves together and to the adjacent pipe covering shall be applied over the lagging and then coated with the end sealing compound in accordance with MIL-C-22395.

S1.28.4 Installation Around Supports and Hangers—Remove only enough insulation from butt edges to provide a snug fit around support brackets or hanger rods. Fill voids between insulation and support with tightly packed fibrous glass felt in accordance with MIL-I-16411 to within \( \frac{1}{4} \) in. (6 mm) from insulation surface. Fill the remainder of space with sealing compound, in accordance with MIL-C-22395, overlapping generously both the support member and the adjacent insulation. Lag and coat with the same method and materials as adjacent piping.

S1.29 Metal Lagging—Metal lagging, where required, shall be installed with lap joints, secured with hardened self-tapping screws (not to be used for below ambient conditions) or metal bands. Joints shall be arranged in a manner which will facilitate run off of impinging liquids.
APPENDIX
(Nonmandatory Information)

XI. RATIONALE

X1.1 This Appendix provides general background information for this practice which is an adaptation of the former MIL STD 769, Thermal Insulation Requirements for Machinery and Piping. The intent of this practice is to provide general guidance describing commercial ship thermal insulation requirements in the main body and military ship requirements in the Supplementary Requirements section. Note that some military specifications and standards are referenced in the main body since there are no approved ASTM equivalents at this time. As ASTM equivalents for these military documents are approved, they will be substituted in the main body, and eventually, the military documents will be purged from this ASTM Practice.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Practice for
Selecting Bolting Lengths for Piping System Flanged Joints

This standard is issued under the fixed designation F 704; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This practice covers bolt and stud bolt lengths, quantities, and thread series for pipe to pipe and pipe to valve flanged joints (Note 1) in the nominal pipe size ranges of ½- through 48-in. (12.7- through 1219-mm) diameter and pressure range of 125 through 2500 psi (0.8 through 17 236 kPa).

Note 1—This is applicable when flange of valve has the same thickness as mating flange.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ANSI Standards:

B1.1 Unified Screw Threads

B16.1 Cast Iron Pipe Flanges and Flanged Fittings (25, 125, 250, and 800 lb)

B16.5 Steel Pipe Flanges and Flanged Fittings (150, 300, 400, 600, 900, 1500, and 2500 lb Including Reference to Valves)

B16.24 Bronze Flanges and Flanged Fittings (150 and 300 lb)

B18.2.1 Square and Hex Bolts and Screws

B18.2.2 Square and Hex Nuts

2.2 Other Standard:

MSS SP-44 Steel Pipe Flanges

1 This practice is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

2 Available from American National Standards Institute, 25 W. 43rd St., 4th Floor, New York, NY 10036.

3 Available from Manufacturer’s Standardization Society of the Valve and Fittings Industry, 1815 N. Fort Myer Dr., Arlington, VA 22209.

3. Bolting Criteria

3.1 Bolt and stud bolt lengths are computed using the following (see Annex A1):

3.1.1 Includes maximum nut thickness in accordance with ANSI B18.2.2.

3.1.2 Does not include washer thickness.

3.1.3 Does not include bolt or stud bolt point height.

3.1.4 Includes allowance for up to ⅛-in. (3.2-mm) thick gaskets, except butterfly valves.

3.1.5 Includes ¼-in. (6.3-mm) raised face in addition to flange thickness listed in tables for flanges rated at 400 psi (2.8 kPa) and above.

3.1.6 Includes use of heavy hex nut and bolt design.

3.1.7 Includes plus tolerance for flange thickness in accordance with ANSI B16.5.

3.2 All bolts and stud bolts have threads in accordance with ANSI B1.1. Class 2A dimensioning and nuts Class 2B.

3.3 The material requirements for bolts, stud bolts, and nuts are obtained from the material specifications of individual system diagrams.

3.4 Alloy steel bolting 1-in. (25.4-mm) nominal diameter and smaller and all carbon steel bolting has threads of the UNC Series; alloy steel bolting above 1-in. nominal diameter has threads of the 8-UN Series.

3.5 For detailed descriptions of flange bolting assemblies, butterfly valve bolting assemblies, and tapped lug-type butterfly valve bolting assemblies, refer to Figs. 1–7.

4. List of Tables

4.1 The tables are arranged in the following sequence:

150-lb Steel Flanged Joints

300-lb Steel Flanged Joints

400-lb Steel Flanged Joints

600-lb Steel Flanged Joints

900-lb Steel Flanged Joints

1500-lb Steel Flanged Joints

2500-lb Steel Flanged Joints

150-lb Bronze Flanged Joints

300-lb Bronze Flanged Joints

150-lb Steel Flat Face to 150-lb Bronze Flanged Joints

300-lb Steel Flat Face to 300-lb Bronze Flanged Joints

FIG. 6 Butterfly Valve Bolt Assembly with 150-psi Steel or Bronze Flanges
A1. METHOD FOR CALCULATING BOLTING LENGTHS

A1.1 The following equations were used in determining bolt and stud bolt lengths in Tables 1-16 and are included in this annex for computing bolting lengths not shown in these tables.

A1.1.1 Bolting lengths for flange to flange joints are computed using the following equation:

\[
L_{SB} = 2T + 2N + G + 2t + 2F + n \quad (A1.1)
\]

\[
L_{MB} = 2T + N + G + 2t + 2F + n \quad (A1.2)
\]

where:
- \( L_{SB} \) = length of stud bolt (effective thread length excluding point height),
- \( L_{MB} \) = length of machine bolt as measured from underside of head to first thread,
- \( T \) = minimum flange thickness,
- \( t \) = plus tolerance for flange thickness in accordance with ANSI B16.5,
- \( N \) = maximum height of nut (heavy hex) in accordance with ANSI B18.2.2,
- \( G \) = \( \frac{1}{8} \)-in. gasket thickness (maximum),
- \( F \) = height of raised face where not included in flange thickness, and
- \( n \) = negative bolting length tolerance in accordance with ANSI B18.2.1.

A1.1.2 Bolting lengths for wafer-type butterfly valves (commercial grade) installed between pipe flanges are computed using the following equation:

\[
L_{MB} = 2T + N + V + 2t + n \quad (A1.3)
\]

where:
- \( L_{MB} \) = length of machine bolt as measured from underside of head to first thread,
- \( L_{SB} \) = length of stud bolt excluding point height,
- \( T \) = minimum flange thickness,
- \( t \) = plus tolerance for flange thickness in accordance with ANSI B16.5,
- \( N \) = maximum height of nut (heavy hex) in accordance with ANSI B18.2.2,
- \( V \) = thickness of butterfly valve,
- \( n \) = negative stud bolt length tolerance in accordance with ANSI B18.2.1.

A1.1.3 Bolt lengths for tapped lug-type butterfly valves (commercial grade) installed between pipe flanges are computed using the following equation:

\[
L_{MB} = T + \frac{V}{2} \quad (A1.5)
\]

where:
- \( L_{MB} \) = length of machine bolt as measured from underside of head to first thread,
- \( T \) = minimum flange thickness, and
- \( V \) = thickness of butterfly valve.

\[\text{NOTE A1.1—Rounding-off bolt or stud bolt length to} \ 0.25\text{-in. (6.3-mm) increments: where } L_{SB} \text{ or } L_{MB} \text{ is 0.10 in. or more greater than any } 0.25\text{-in. increment, round off upward; if less than 0.10 in., round off downward to next } 0.25\text{-in. increment. } L_{MB} \text{ for tapped lug-type butterfly valve, round off downward to next } 0.25\text{-in. increment.} \]

\[\text{NOTE A1.2—Users are reminded that removing the raised face will} \]
make the flange thickness dimension nonstandard.

**NOTE A1.3**—Stud bolt lengths listed in Table 15 and Table 16 are sized to accommodate maximum width of all commercial grade wafer-type butterfly valves of up to 150-psi pressure rating.

**NOTE A1.4**—Bolt lengths listed in Table 17 and Table 18 are sized to accommodate minimum width of all commercial grade tapped lug-type butterfly valves of up to 150-psi pressure ratings.

Standard Specification for Modular Gage Boards

This standard is issued under the fixed designation F 707/F707M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers modular gage boards for mounting 89-mm (3 1/2-in.), 114-mm (4 1/2-in.), 152-mm (6-in.), and 216-mm (8 1/2-in.) dial size pressure gages and dial thermometers for miscellaneous shipboard applications.

1.2 Gage boards ordered under this specification are suitable for pressure gages and dial thermometers with either turret or back flanged type cases and with either back or bottom connections (see Appendix X1).

1.3 Gage mounting dimensions shall be in accordance with ANSI B 40.1.

1.4 The values stated in metric units (SI) are to be regarded as the standard. The values given in parentheses (inch/pound) are provided for information purposes.

NOTE 1—Gage boards covered by this specification are those normally supplied by the shipyard as opposed to the shipyard’s equipment subcontractor.

2. Referenced Documents

2.1 ASTM Standards:
   B 40.1 Gages, Pressure and Vacuum, Indicating Dial Type—Elastic Element

2.2 Other Standards:
   Fed Spec. TT-P-645 Primer, Paint, Zinc-Chromate, Alkyd Type
   DoD-P-15328 Primer (Wash), Pretreatment (Formula No. 117 for Metals) (Metric)

3. Classification

3.1 Gage boards are furnished in two types as follows:
   3.1.1 Type I—Gage boards for mounting 89-mm (3 1/2-in.) and 114-mm (4 1/2-in.) dial size gages as specified in Section 5.
   3.1.2 Type II—Gage boards for mounting 152-mm (6-in.) and 216-mm (8 1/2-in.) dial size gages as specified in Section 5.

3.2 Gage boards are furnished in two grades as follows:
   3.2.1 Grade a—Gage boards are to be manufactured from carbon steel as specified in Section 5.
   3.2.2 Grade b—Gage boards are to be manufactured from aluminum alloy as specified in Section 5.

4. Ordering Information

4.1 Orders for gage boards under this specification shall include the following information:
   4.1.1 Quantity (number of gage boards),
   4.1.2 Name of item (gage board),
   4.1.3 Type (Type I or Type II as specified by purchaser), see 3.1.1 and 3.1.2,
   4.1.4 Grade (Grade a or Grade b as specified by purchaser), see 3.2.1 and 3.2.2,
   4.1.5 Paint (as specified by purchaser), see 7.2,
   4.1.6 Drilling for gage mounting (as specified by purchaser), see 5.1.1, and
   4.1.7 ASTM designation and date of issue.

5. Materials and Manufacture

5.1 Unless otherwise specified the gage boards shall be manufactured from 11-gage (manufacturers standard gage) carbon steel for Grade a and 3 mm (1/8 in.) thick aluminum alloy for Grade b. Materials shall be capable of being bent at room temperature through 90° in any direction to an inside radius equal to its thickness without cracking on the outside of the bent portion.

5.1.1 Unless otherwise specified, Type I gage boards shall be drilled for mounting both 89-mm (3 1/2-in.) and 114-mm (4 1/2-in.) dial size gages and Type II gage boards shall be drilled for mounting both 152-mm (6-in.) and 216-mm (8 1/2-in.) dial size gages. When specified by the purchaser, drilling shall be limited to one size gage for either Type I or Type II gage boards (see 4.1.6).

6. Dimensions and Permissible Variations

6.1 The dimensions of the gage board shall not vary by more than 0.4 mm (±1/64 in.) except as noted in Fig. 1 and Fig. 2.

7. Workmanship, Finish and Appearance

7.1 The gage boards shall have a workmanlike finish free of scale, burrs, cracks, and other defects affecting serviceability or appearance.
7.2 If paint is not specified by the purchaser, Grade a gage boards shall be supplied with a coat of zinc chromate primer in accordance with Federal Specification TT-P-645, Formula 84 or equal (yellow) 0.038-mm (1.5-mils) dry film thickness. Grade b gage boards shall be supplied with one pretreatment wash coat in accordance with Specification DOD-P-15328 Formula 117 or equal (dark green) 0.013-mm (0.5-mils) dry film thickness and one coat of zinc chromate primer in accordance with Federal Specification TT-P-645 Formula 84D or equal (dark green) 0.013 mm (1.5-mils) dry film thickness.

8. Product Marking

8.1 Each shipping unit shall bear a tag or be plainly marked with the following: ASTM designation number, name or trademark of manufacturer, number of pieces, and purchase order number.

9. Keywords

9.1 dial pressure gages; dial thermometers; modular gage boards; pressure gages
APPENDIX

X1. RATIONALE USED FOR DEVELOPMENT OF SPECIFICATION FOR MODULAR GAGE BOARDS

X1.1 This specification has been developed primarily to provide maximum versatility for the installation of 89-mm (3 1/2 -in.), 114-mm (4 1/2 -in.), 152-mm (6-in.), and 216-mm (8 1/2 -in.) dial size simplex, duplex, and differential pressure gages and dial thermometers with either turret- or back-flanged cases. Fig. X1.1 Fig. X1.2 Fig. X1.3

X1.2 The gage board is suitable for single-gage installation, but has the versatility of being bolted together horizontally, vertically, in pyramid fashion or a combination thereof to provide for multigage installations utilizing both Type I and Type II gage boards.

X1.3 When used in horizontally arranged installations, either bottom or back connected pressure gages and dial

**FIG. X1.1 Bottom- and Back-Connected Pressure Gages for Horizontal Installations of Type I or Type II Gage Boards**
thermometers may be used. When used vertically or in combination with vertical, horizontal, or pyramid arrangements, back connected pressure gages and dial thermometers must be used.

X1.4 This specification does not cover flush-mounted gages.
1. Scope

1.1 This specification covers modular gage boards for mounting 89-mm (3½-in.), 114-mm (4½-in.), 152-mm (6-in.), and 216-mm (8½-in.) dial size pressure gages and dial thermometers for miscellaneous shipboard applications.

1.2 Gage boards ordered under this specification are suitable for pressure gages and dial thermometers with either turret or back flanged type cases and with either back or bottom connections (see Appendix X1).

1.3 Gage mounting dimensions shall be in accordance with ANSI B 40.1.

1.4 The values stated in metric units (SI) are to be regarded as the standard. The values given in parentheses (inch/pound) are provided for information purposes.

2. Referenced Documents

2.1 ASTM Standards:
B 40.1 Gages, Pressure and Vacuum, Indicating Dial Type—Elastic Element

2.2 Other Standards:
Fed Spec. TT-P-645 Primer, Paint, Zinc-Chromate, Alkyd Type
DoD-P-15328 Primer (Wash), Pretreatment (Formula No. 117 for Metals) (Metric)

3. Classification

3.1 Gage boards are furnished in two types as follows:

3.1.1 Type I—Gage boards for mounting 89-mm (3½-in.) and 114-mm (4½-in.) dial size gages as specified in Section 5.

3.1.2 Type II—Gage boards for mounting 152-mm (6-in.) and 216-mm (8½-in.) dial size gages as specified in Section 5.

3.1.2.1 Grade a—Gage boards are to be manufactured from carbon steel as specified in Section 5.

3.1.2.2 Grade b—Gage boards are to be manufactured from aluminum alloy as specified in Section 5.

4. Ordering Information

4.1 Orders for gage boards under this specification shall include the following information:

4.1.1 Quantity (number of gage boards),
4.1.2 Name of item (gage board),
4.1.3 Type (Type I or Type II as specified by purchaser), see 3.1.1 and 3.1.2,
4.1.4 Grade (Grade a or Grade b as specified by purchaser), see 3.2.1 and 3.2.2,
4.1.5 Paint (as specified by purchaser), see 7.2,
4.1.6 Drilling for gage mounting (as specified by purchaser), see 5.1.1, and
4.1.7 ASTM designation and date of issue.

5. Materials and Manufacture

5.1 Unless otherwise specified the gage boards shall be manufactured from 11-gage (manufacturers standard gage) carbon steel for Grade a and 3 mm (1/8 in.) thick aluminum alloy for Grade b. Materials shall be capable of being bent at room temperature through 90° in any direction to an inside radius equal to its thickness without cracking on the outside of the bent portion.

5.1.1 Unless otherwise specified, Type I gage boards shall be drilled for mounting both 89-mm (3½-in.) and 114-mm (4½-in.) dial size gages and Type II gage boards shall be drilled for mounting both 152-mm (6-in.) and 216-mm (8½-in.) dial size gages. When specified by the purchaser, drilling shall be limited to one size gage for either Type I or Type II gage boards (see 4.1.6).
6. Dimensions and Permissible Variations

6.1 The dimensions of the gage board shall not vary by more than 0.4 mm (± ⅖ in.) except as noted in Fig. 1 and Fig. 2.

7. Workmanship, Finish and Appearance

7.1 The gage boards shall have a workmanlike finish free of scale, burrs, cracks, and other defects affecting serviceability or appearance.

7.2 If paint is not specified by the purchaser, Grade a gage boards shall be supplied with a coat of zinc chromate primer in accordance with Federal Specification TT-P-645, Formula 84 or equal (yellow) 0.038-mm (1.5-mils) dry film thickness. Grade b gage boards shall be supplied with one pretreatment wash coat in accordance with Specification DOD-P-15328 Formula 117 or equal (dark green) 0.013-mm (0.5-mils) dry film thickness and one coat of zinc chromate primer in accordance with Federal Specification TT-P-645 Formula 84D or equal (dark green) 0.013 mm (1.5-mils) dry film thickness.

8. Product Marking

8.1 Each shipping unit shall bear a tag or be plainly marked with the following: ASTM designation number, name or trademark of manufacturer, number of pieces, and purchase order number.

9. Keywords

X1. RATIONALE USED FOR DEVELOPMENT OF SPECIFICATION FOR MODULAR GAGE BOARDS

X1.1 This specification has been developed primarily to provide maximum versatility for the installation of 89-mm (3½-in.), 114-mm (4½-in.), 152-mm (6-in.), and 216-mm (8½-in.) dial size simplex, duplex, and differential pressure gages and dial thermometers with either turret- or back-flanged cases (see Fig. X1.1 Fig. X1.2 Fig. X1.3).

X1.2 The gage board is suitable for single-gage installation, but has the versatility of being bolted together horizontally, vertically, in pyramid fashion or a combination thereof to
provide for multigage installations utilizing both Type I and Type II gage boards.

X1.3 When used in horizontally arranged installations, either bottom or back connected pressure gages and dial
thermometers may be used. When used vertically or in com-
bination with vertical, horizontal, or pyramid arrangements, 
back connected pressure gages and dial thermometers must be 
used.

X1.4 This specification does not cover flush-mounted
Standard Practice for Design and Installation of Rigid Pipe Hangers

1. Scope

1.1 This practice covers acceptable methods of fabricating and installing rigid pipe hangers used to support shipboard piping systems with temperatures of 650°F (343°C) or less.

1.2 This practice provides guidance for the design of hanger caps, straps and standoffs, selection of hanger and hanger liner materials, hanger bolting, and hanger spacing.

1.3 Other hanger designs may be used provided they result in an adequately supported vibration-free piping system and are compatible with the intended system service and temperature limitations.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards: 2

A 307 Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength

3. Terminology

3.1 Definitions:

3.1.1 liner—the material used to isolate a pipe from its hanger.

3.1.2 rider bar—a protective strip of material installed between the pipe and the hanger where frequent linear movement of the pipe is expected.

3.1.3 rigid pipe hanger—a device that transfers the load imposed by the piping, insulation, and system medium to the supporting structure.

3.1.4 standoff—the rigid member that connects the hanger strap, saddle, or band to the supporting structure. A standoff is usually made up of one or more pieces of flat bar, pipe, angle bar, or flanged plate to suit a specific location.

4. List of Pipe Hanger Styles

4.1 This practice incorporates 26 pipe hanger assemblies as shown on Figs. 1-12(c) as follows:

2 For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard’s Document Summary page on the ASTM website.
5. Hanger Designs

5.1 Figs. 1-5 and Fig. 6(a) hangers are designs generally manufactured by shipyards or their subcontractors. See also Tables 1-6.

5.2 Fig. 6, Fig. 8, Fig. 10, and Fig. 11 hangers are commercially available from various vendors. Fig. 8, Fig. 10, and Fig. 11 hangers are primarily designed for use in supporting electrical cables, but are suitable for hanging small size pipe and tubing.

5.2.1 The Fig. 7 hanger is a specific design that has been patented by Nelson Division of TRW.

5.2.2 The Fig. 9 and Fig. 12 hangers are primarily designed for use when supporting multiple runs of pipe or tubing.

6. Materials and Manufacture

6.1 Hanger materials for straps, saddles, and U-bolts for Figs. 1-5 hangers and standoffs should be fabricated from commercial quality carbon steel. The steel should be a weldable grade with a minimum tensile strength of 47 ksi (324 MPa) and capable of being bent at room temperature through 90° to an inside radius equal to the material thickness without cracking on the outside of the bend.

6.2 Hangers in Fig. 1, Fig. 6, Fig. 7, Fig. 10, and Fig. 11 are generally manufactured from carbon steel. Fig. 8 is furnished in carbon steel and stainless steel. Fig. 9 and Fig. 12 hanger clamp halves are injected molded plastic furnished with carbon steel or stainless steel hardware.

6.3 Bands and buckles for Fig. 6 and Fig. 11 hangers should be carbon steel electroplated zinc or stainless steel.

6.4 Hanger bolts and nuts should be regular series hex type electroplated zinc with unified national coarse threads Class 2 fit in accordance with Specification A 307, Grade B.

6.5 Table 7 is a listing of hanger liner materials generally used to isolate the pipe from the hanger (see 9.1.1).

---

6 The sole source of supply of the apparatus known to the committee at this time is TRW Nelson Div., Toledo Ave. and E. 28th St., Lorain, OH 44055. If you are aware of alternative suppliers, please provide this information to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend.

7 The sole source of supply of the apparatus known to the committee at this time is Stauff Corp., 41 Newman St., Hackensack, NJ 07601. If you are aware of alternative suppliers, please provide this information to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend.

8 The sole source of supply of the poly-block hangers known to the committee at this time is Behringer Corp., 108 Jabez St., Newark, NJ 07105. If you are aware of alternative suppliers, please provide this information to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend.

Other materials may be used provided the materials selected are compatible with the intended service and temperature limitations.

Use of asbestos as a hanger liner material shall be prohibited due to the potential health hazard in working with this material.

Similar to Amatex Corp., Thermoglass style G65752 9731 finish, or Claretex Style 19-T-125 or equivalent.

Only oil-resistant synthetic rubber should be used in oil tanks.

</table>
NOTE 1—For dimensions of hangers, see Table 1.
NOTE 2—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather, and can be used lined or unlined.
NOTE 3—For Fig. 1(b), length of standoff legs may be unequal and angle of attachment may vary as required to suit conditions.
NOTE 4—Maximum length of standoff “L” shall be as follows: flat bar = 18 in.; pipe = 30 in.; and angle bar = 42 in.

FIG. 1 Split Cap Hangers

Note 1—For dimensions of hangers, see Table 2.
Note 2—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather, and can be used lined or unlined.
Note 3—Install standard flat washers as necessary to unlined strap to provide 1/32 to 1/8-in. (0.8 to 3.2-mm) clearance for linear motion of piping when required.

FIG. 2 Strap Hangers
**NOTE 1**—For dimensions of hangers, see Table 3.

**NOTE 2**—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather, and are intended to be used unlined only.

**NOTE 3**—Weld as indicated for size 3-in. NPS and above. For 2½-in. NPS and below, weld hanger on outside only.

**FIG. 3 Welded Hangers**

**FIG. 4 U-Bolt Hangers**

**NOTE 1**—For dimensions of hangers, see Table 4.

**NOTE 2**—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather, and are intended to be used unlined.
NOTE 1—For dimensions of hangers, see Table 5.

NOTE 2—These hangers are limited to use on normally dry ferrous piping systems, such as sounding tubes. Air escapes and plumbing drains with a wall thickness of 0.200 in. (5.1 mm) or more.

NOTE 3—These hangers should not be used where takedown is required or in the steering gear room, inner bottoms, fore peak, aft peak or deep tanks, or other high vibration or inaccessible areas.

NOTE 4—For Fig. 5(b), length of standoff legs may be unequal and angle of attachment may vary as required to suit conditions.

FIG. 5 Welded Hangers

(a) Single Leg Standoff Welded Direct to Pipe

(b) Dual Leg Standoff Welded Direct to Pipe
NOTE 1—For dimensions of hangers, see Table 6.

NOTE 2—These hangers are suitable for use in all locations, except tanks and areas exposed to the weather, and can be used lined or unlined.

FIG. 6 J-Band Type Hangers
NOTE 1—This hanger is suitable for use in all locations except tanks.

NOTE 2—This hanger is limited to use on pipe 4-in. NPS and below with a system operating temperature of 200°F (93.3°C) or less.

FIG. 7 Nelson Hanger

Note 1—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather. When used in areas subject to high corrosion, such as salt water ballast tanks or weather decks, stainless steel hanger components shall be used.

Note 2—These hangers are suitable for supporting single or multiple runs of piping 2 in. (50.8 mm) or smaller.

FIG. 8 Clamp Hanger Assembled with Mounting Channel
**F 708 – 92 (2004)**

**NOTE 1**—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather. When used in areas subject to high corrosion, such as salt water ballast tanks or weather decks, stainless steel hanger components shall be used.

**NOTE 2**—These hangers are limited to use on pipe 1 1/4-in. NPS and below and tubing 1 1/2-in. outside diameter and below with a system operating temperature of 300°F (149°C) or less.

**NOTE 3**—These hangers may be used for multiple pipe installations installed vertically, horizontally, or stacked using a welding plate, welding stud, or attached to a mounting channel.

---

**FIG. 9 Stauff Twin Clamp Hanger**

**NOTE 1**—These hangers are suitable for use in all locations, except tanks, and should be coated with neoprene or other similar material when used to support nonferrous tubing.

**NOTE 2**—These hangers are limited to use on tubing with an outside diameter of 1 1/8 in. (28.6 mm) or smaller with a system operating temperature of 180°F (82.2°C) or less.

**NOTE 3**—Size and quantity of tubes may be varied provided they are arranged so as to be securely clamped.

**FIG. 10 Crimp-On Weld Stud Hangers**
NOTE 1—These hangers are suitable for use in all locations except tanks.

NOTE 2—These hangers are limited to use on tubing with an outside diameter of ½ in. (12.7 mm) or smaller with a system operating temperature of 180°F (82.2°C) or less.

NOTE 3—Size and quantity of tube may be varied, provided they are arranged so as to be securely clamped.

**FIG. 11 Banded Weld Stud Hanger**

NOTE 1—These single poly-block hangers are available in Standard Duty and Heavy Duty Series dependent upon application.

NOTE 2—These hangers are suitable for use in all locations, including tanks and areas exposed to the weather. When used in areas subject to high corrosion, such as salt water ballast tanks or weather decks, stainless steel hanger components shall be used.

NOTE 3—These hangers are limited to use on pipe 8-in. NPS and below and tubing 8-in. outside diameter and below with a system operating temperature of 300°F (149°C) or less.

NOTE 4—These hangers may be used for multiple pipe installations installed vertically, horizontally, or stacked using a weld plate, weld stud, or attached to a mounting channel.

**FIG. 12 Poly-block Clamp Hangers**
Standard for
Shipbuilders and Marine Paints and Coatings Product/
Procedure Data Sheet

This standard is issued under the fixed designation F 718; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 The Shipbuilders and Marine Paints and Coatings
Product/Procedure Data Sheet provides on one sheet needed
information concerning the characteristics of a specific paint or
coating to include generic description, physical properties,
surface preparation requirements, application requirements,
and safety. The front side of the sheet contains four major,
numbered paragraphs and a highlighted section for
Special Safety Precautions. These paragraphs are as follows:
I. Generic Type and Description
II. Manufacturers Data
III. Properties
IV. Surface Preparation Minimum Requirements

The back side of the page contains the following paragraphs:
V. Mixing Procedure
VI. Application.

1.2 The completed data sheets can be used by technical
personnel to help evaluate the technical acceptability of a
proposed material, by production personnel to evaluate pro-
duction compatibility of proposed materials and to provide
application instructions for selected paints and coatings mater-
ials, and by quality control personnel to verify attributes of
materials.

2. Referenced Documents

2.1 ASTM Standards:
D 56 Test Method for Flash Point by Tag Closed Tester
D 93 Test Methods for Flash Point by Pensky-Martens
Closed Cup Tester
D 523 Test Method for Specular Gloss
D 1650 Test Methods of Sampling and Testing Shellac
Varnish
D 2697 Test Method for Volume Nonvolatile Matter in
Clear or Pigmented Coatings
D 3278 Test Method for Flash Point of Liquids by Small
Scale Closed Cup Apparatus

2.2 Method
24 U. S. Environmental Protection Agency, 40 CFR Ch. 1,
Part 60, Appendix A, Determination of Volatile Matter
Content, Density, Volume Solids, and Weight Solids of
Surface Coatings

3. Instructions for Completing Data Sheet

3.1 When filling out the Product/Procedure Data Sheet (see
Figs. 1 and 2) remember that the information contained therein
will be utilized by both technical and production personnel.
Keep it simple and brief but complete. The following instruc-
tions are organized by paragraph numbers contained within the
data sheet. Also see the two examples attached (Appendix X1).

3.2 Paragraph I—Generic Type and Description—Use only
known and industry-accepted generic descriptions. See Fig. 1.

3.3 Paragraph II—Manufacturers Data—This section is
self-explanatory with the possible exception of subparagraph
(f). This can be as complete or as brief as the concerned parties
desire. For example, a separate attached list of compatible and
incompatible topcoats or acceptable cargo exposures could be
included. See Fig. 1.

3.4 Paragraph III—Properties—This section is self-
explanatory with the possible exception of subparagraph (a).
If agreed upon by the concerned parties, a different method for
determining volume solids (theoretical coverage) may be
substituted. The form should be amended to show method. See
Fig. 1.

3.5 Special Safety Precautions—This section should con-
tain specific instructions of what to do in the event of skin or
eye contact or accidental ingestion, or both. Reference should

---

1 This standard is under the jurisdiction of ASTM Committee F25 on Ships and
Marine Technology and is the direct responsibility of Subcommittee F25.01 on
Structures.

2 Copies of the data sheet are available at a nominal charge from ASTM
Headquarters, 100 Barr Harbor Dr., PO Box C700, West Conshohocken, PA
19428-2959. Request Adjunct No. ADJF0718.

3 Annual Book of ASTM Standards, Vol 05.01.

4 Annual Book of ASTM Standards, Vol 06.01.

5 Withdrawn. See 1997 Annual Book of ASTM Standards, Vol 06.03.

6 Superintendent of Documents, Government Printing Office, Washington, DC

also be made to the appropriate manufacturer’s Material Safety Data Sheet. See Fig. 1.

3.6 Paragraph IV—Surface Preparation Minimum Requirements:

3.6.1 Subparagraphs (a) and (b)—Use an agreed-upon standard that is, ASTM, SSPC, Swedish, NACE, SNAME, etc. See Fig. 1.

3.6.2 Subparagraph (c)—Profile data are optional. If used, the profile listed must be given as a range. The method of measurement must be agreed upon by all parties concerned, or this paragraph can be left blank and the type and size of abrasive(s) allowed entered in subparagraph (d), Special Instructions. See Fig. 1.

3.7 Paragraph V—Mixing Procedure—This section is self-explanatory with the possible exceptions of subparagraphs (c) and (f). Subparagraph (c) should preferably contain a generic solvent as opposed to a proprietary one. Subparagraph (f) should, as a minimum, contain the mesh size of the straining material and special procedures governing which component should be added to the other. Subparagraph (b), if appropriate, should include length of induction time given as a function of various temperatures. See Fig. 2.

3.8 Paragraph VI—Application—This section is one of the most important of the entire form. It must be filled out accurately and completely using all blocks in every paragraph. Subparagraph (c), “Dry Times,” is to be used for tank coatings,
V. MIXING PROCEDURE:

### I. GENERIC TYPE AND DESCRIPTION:
- Epoxy Polyamide

<table>
<thead>
<tr>
<th>Specification Number (If Applicable):</th>
<th>MIL-F-23236</th>
</tr>
</thead>
</table>

### II. MANUFACTURER DATA:
- **MANUFACTURER:** R-Equal Paint Mfg. Co.
- **PRODUCT DESIGNATION:** 40-DX, Red 40-DX-16, White 40-DX-17, Blue 40-DX-18
- **COLOR(S):** Red, White, Blue
- **USES:** Ballast Tanks
- **TECHNICAL SERVICE REPRESENTATIVE**
  - (Include Telephone No.) (000) 000-0000
  - Mr. Good Brush (000). 000-0000 (FAX)
- **NOT RECOMMENDED FOR:** High temperature service above 80°C

### III. PROPERTIES:
- **% VOLUME SOLIDS (ASTM D 2697):** 50%
- **FLASH POINT (ASTM TEST METHOD D 93); OR (ASTM TEST METHOD D 56);**
  - **OR (ASTM TEST METHOD D 3278):** 35°C
- **WEIGHT PER GALLON (FTMS141a4184.1):** 1.4 kg/l
- **SHELF LIFE:** 24 months
- **VIS COSITY (FTMS141a4281):** 120 K.U.
- **PACKAGING:** 2 premeasured metal containers, one packaged inside the other
- **NUMBER OF COMPONENTS:** 2
- **STORAGE REQUIREMENTS:** TEMP.
  - MIN. -18°C
  - MAX. 60°C
- **GLOSS (ASTM D 523):** Eggshell
- **VOLATILE ORGANIC COMPOUND (EPA TEST METHOD 24):**
- **WEIGHT OF DRY FILM (WEIGHT PER AREA AT A GIVEN THICKNESS):**

### SPECIAL SAFETY PRECAUTIONS:
- Harmful if inhaled. Could cause skin irritation and may cause respiratory reaction. Keep away from excessive heat and open flame. Use only with adequate ventilation. See U.S. Department of Labor Material Safety Data Sheet for additional information

### IV. SURFACE PREPARATION MINIMUM REQUIREMENTS (USE SPECIFIC STANDARD NUMBERS):
- **INITIAL -** Near White Blast, SSFC-SP-10
  - For Recoat - First coat must be clean and dry. Mechanically etch if recoat time has expired
- **TOUCH-UP -** Same as above. Limited power tool cleaning using disk grinders
- **PROFILE (INCLUDE METHOD USED):** Gardner Model 123 Profile meter
  - MIN. 40 MIC. MAX. 100 MIC.
- **SPECIAL INSTRUCTIONS:** Do not use power wire brush
- **PRIMER REQUIREMENTS (IF APPLICABLE):** Material is self-priming. The first coat is considered the prime coat

*FIG. X1.1 Sample Sheet (Front)*
V. MIXING PROCEDURE:
(a) MIXING RATIO BY WEIGHT - 3.6\text{kg} powder to 2.6\text{kg} liquid
BY VOLUME - 1 liter powder to 3.1 liters liquid
(b) INDUCTION TIME - none
(c) RECOMMENDED SOLVENT - THINNING -
CONFINED AREAS - #1 Solvent
NON-CONFINED AREAS - #2 Solvent
CLEAN UP - Cellosolve Acetate
(d) THINNING REQUIREMENTS (RATIO) - 10 % maximum
(e) POT LIFE -

\begin{tabular}{ccc}

\text{Hr(s)} & 4 & 4 \\
\text{C}   &   & C
\end{tabular}

\begin{tabular}{ccc}

\text{Hr(s)} & 24 & 4 \\
\text{C}   &   & C
\end{tabular}

(f) SPECIAL INSTRUCTIONS -
Strain mixture through #30 mesh screen.
Keep mixture under constant agitation.
Do not thin in VOC compliant areas.

VI. APPLICATION:
(a) ENVIRONMENTAL LIMITATIONS -
\begin{tabular}{ccc}

\text{TEMP. MIN.} & \text{-80°C} & \text{MAX.} & \text{80°C} \\
\text{% RELATIVE HUMIDITY MIN.} & 40% & \text{MAX.} & 95%
\end{tabular}

(b) FILM THICKNESS (SSPC PA2-73T) - WET MIN. 3.0 WET MAX. See Special Instructions
DRY MIN. 0.7 DRY MAX. See Special Instructions
(c) DRY TIMES (ASTM D 1650)-RECOAT
\begin{tabular}{ccc}

\text{MIN.} & 24 & \text{Hr(s)} \text{MIN.} & 18 & \text{C} \text{MIN.} & 14 \text{Hr(s)} \text{MIN.} & 10 \text{C} \\
\text{MAX.} & & \text{Hr(s)} & & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)}
\end{tabular}

TO HANDLE
\begin{tabular}{ccc}

\end{tabular}

FOR IMMERSION
\begin{tabular}{ccc}

\text{MIN.} & \text{N.A.} & \text{Hr(s)} & \text{MAX.} & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)} \\
\text{MIN.} & \text{N.A.} & \text{Hr(s)} & \text{MAX.} & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)} & & \text{Hr(s)}
\end{tabular}

(d) EQUIPMENT REQUIREMENTS (INCLUDE PREFERRED, SUITABLE AND NOT SUITABLE REQUIREMENTS).
Conventional spray-agitated pot, external mix gun with heavy-duty spring & 1.8m/mtip combination.
Airless spray - 8m/m with 80-185bar fluid pressure.
Brush - Use only for minor touch-up
Roller - Do not use.

(e) SPECIAL INSTRUCTIONS - Film thickness must be uniformly correct to facilitate welding and burning operations. No impact on performance. Qualified for use with the following welding processes: SAW, Flux Core, Short Arc, HIG, and Stick. Contact Technical Representative in Para. II(e) for parameters.

* CAUTION SHOULD BE TAKEN THAT SURFACE TEMPERATURE IS AT LEAST 3°C ABOVE DEW POINT.

FIG. X1.2 Sample Sheet (Back)
I. GENERIC TYPE AND DESCRIPTION:
Specification Number (If Applicable): Alky (Solvent-Based) Inorganic Zinc Silicate Primer

II. MANUFACTURERS DATA:
(a) MANUFACTURER: R-Equal Paint Mfg. Co.
(b) PRODUCT DESIGNATION: 86-DC-1 Gray
(c) COLOR(S): Gray
(d) USES: Preconstruction Primer
(e) TECHNICAL SERVICE REPRESENTATIVE
   (include Telephone Nos.): (100) 242-6000
   Mr. Good Brush (000) 000-000 (FAX)
(f) NOT RECOMMENDED FOR: Immersion Service
   See Technical Representative for compatible topcoats

III. PROPERTIES:
(a) % VOLUME SOLIDS (ASTM D 2697): 30
(b) FLASH POINT (ASTM TEST METHOD D 93); OR (ASTM TEST METHOD D 56);
    OR (ASTM TEST METHOD D 927) 25°C
(c) WEIGHT PER GALLON (FTMS1414418.41): 1.4 kg/l
(d) SHELF LIFE: 9 months
(e) VISCOSITY (FTMS1414428.1): 78 K.U.
(f) PACKAGING: Premeasured powder packaged in metal container.
    Premeasured liquid in polyurethane
(g) NUMBER OF COMPONENTS: 2
(h) GLOSS (ASTM D 523): container flat
(i) STORAGE REQUIREMENTS: TEMP. MIN. N/A MAX. 60°C
(j) VOLATILE ORGANIC COMPOUND (EPA TEST METHOD 24):
(k) WEIGHT OF DRY FILM (WEIGHT PER AREA AT A GIVEN THICKNESS):

SPECIAL SAFETY PRECAUTIONS:
Solvents contained in this coating are extremely flammable and may cause irritation. Use extreme caution if applying in enclosed areas. Keep away from heat and sparks or open flame. Always use with adequate ventilation. See U.S. Department of Labor Material Safety Data Sheet for additional information.

IV. SURFACE PREPARATION MINIMUM REQUIREMENTS (USE SPECIFIC STANDARD NUMBERS):
(a) INITIAL - Commercial Blast, SSPC-SP 6
(b) TOUCH-UP - Power Tool Clean, SSPC-SP 3
(c) PROFILE INCLUDE METHOD USED - MIN. 25 mic Max. 90 mic
   Gardner Model 123 Profilometer
(d) SPECIAL INSTRUCTIONS -
   Do not use power wire brush for power tool cleaning.
(e) PRIMER REQUIREMENTS (IF APPLICABLE): None

OVER
V. MIXING PROCEDURE:

(a) MIXING RATIO BY WEIGHT - 1kg component A to 1kg of component B
BY VOLUME - 1 part component A to 1 part component B

(b) INDUCTION TIME - 30 minutes

(c) RECOMMENDED SOLVENT - THINNING -

- CONFINED AREAS - #1 Solvent
- NON-CONFINED AREAS - #2 Solvent
- CLEAN UP - 1 part xylene to 1 part MIBK

(d) THINNING REQUIREMENTS (RATIO) - 25% maximum

(e) POT LIFE -

(d) EQUIPMENT REQUIREMENTS (INCLUDE PREFERRED, SUITABLE AND NOT SUITABLE REQUIREMENTS).

Conventional spray-agitated pot, external mix spray gun with 1.8m/m tip combination
Airless spray - 8m/m with 80-125 bar fluid pressure
Brush and roller - Minor touch-up only

(e) SPECIAL INSTRUCTIONS - This material is to be applied in three coats using alternate color for each coat.

* CAUTION SHOULD BE TAKEN THAT SURFACE TEMPERATURE IS AT LEAST 3°C ABOVE DEW POINT.
Standard Specification for Gage Piping Assemblies

This standard is issued under the fixed designation F 721; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers details of gage piping assemblies for pressure gages with optional provisions for additional gages, pressure switches, transmitters, and so forth, for use with steam, steam drains, feed water, condensate, fresh water, salt water, compressed air, fuel oil, and lubricating oil systems.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:
A 105/A105M Specification for Carbon Steel Forgings for Piping Applications
A 106 Specification for Seamless Carbon Steel Pipe for High-Temperature Service
A 108 Specification for Steel Bars, Carbon, Cold Finished, Standard Quality
A 182/A182M Specification for Forged or Rolled Alloy-Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service
A 276 Specification for Stainless Steel Bars and Shapes
A 335/A335M Specification for Seamless Ferritic Alloy-Steel Pipe for High-Temperature Service
A 576 Specification for Steel Bars, Carbon, Hot-Wrought, Special Quality
B 16 Specification for Free-Cutting Brass Rod, Bar, and Shapes for Use in Screw Machines
B 61 Specification for Steam or Valve Bronze Castings
B 62 Specification for Composition Bronze or Ounce Metal Castings
B 75 Specification for Seamless Copper Tube
B 124 Specification for Copper and Copper Alloy Forging Rod, Bar, and Shapes
B 453 Specification for Copper-Zinc-Lead Alloy (Leaded-Brass) Rod
B 466/B 466M Specification for Seamless Copper-Nickel Pipe and Tube

2.2 American National Standard Institute Standards:
B16.11 Forged Steel Fittings, Socket Weld, and Threaded
B16.15 Cast Bronze Threaded Fittings

2.3 Federal Specifications:
QQ-S-637 Steel Bar, Carbon, Cold Finished (Standard Quality, Free Machining)
QQ-S-763 Steel Bars, Wire, Shapes, and Forgings, Corrosion-Resisting

3. List of Assemblies

3.1 This specification incorporates 13 gage piping assemblies as described in Table 1.

4. General Requirements and Guidelines

4.1 Fig. 1 shows a typical piping assembly for bottom-connected gages and Fig. 2 a typical piping assembly for back-connected gages.

4.2 A siphon shall be used as shown in all gage applications for steam systems to maintain a protective water seal between the gage and the steam supply.

4.3 Each assembly includes a test connection beyond the gage valve which consists of a tee with a 1/4-in. NPT threaded plug in the branch. The plug is removable for the purpose of installing a test gage for calibration. As an alternative, a gage valve that incorporates a built-in test connection integral with the valve may be substituted for the gage valve and test tee.

4.4 Root connections should be kept to a minimum by connecting other instruments at the tee between the root and gage valves. There is no limit to the number of dead-end-type instruments that can be served from a single root connection. However, each instrument should have its own shutoff valve and, if desired, a test tee may be fitted at each instrument.

4.5 Two shutoff valves are generally used in each assembly, a root valve and a gage cutout valve. The gage valve may be

---

3 Annual Book of ASTM Standards, Vol 01.05.
4 Annual Book of ASTM Standards, Vol 01.03.
5 Annual Book of ASTM Standards, Vol 02.01.
6 Available from American National Standards Institute, 11 W. 42nd St., 13th Floor, New York, NY 10036.
7 Available from Standardization Documents Order Desk, Bldg. 4 Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, Attn: NPODS.
eliminated and a single shutoff valve may serve as both a root and gage valve provided the gage is within 6 ft (1.8 m) of the root connection and readily accessible and the single shutoff valve is fitted within 12 in. (300 mm) of the root connection.

4.6 Pulsation dampeners are shown for certain assemblies between the test tee and gage and should be used in other assemblies in which the gage may be subjected to pulsating pressures, as from a reciprocating pump, air compressor, quick-acting solenoid valves, and high-frequency vibrations of high-pressure feed pumps.

4.7 Isolation devices (diaphragm seals) should be installed where system fluid viscosity and fuel isolation is a consideration.

5. Services, Pressure/Temperature Limitations, and Material

5.1 Service and pressure/temperature limitations for each assembly are listed in Table 1 and materials are listed in Table 2 and Table 3. Other services, pressure/temperatures, and materials may be used provided the materials selected are compatible with the intended system media, and the pressure/temperature limitations do not exceed the limitations of the material chosen.

Standard Specification for
Welded Joints for Shipboard Piping Systems

1. Scope
1.1 This specification covers typical details of welded joints commonly used in shipboard piping systems. These joints and other joints may be used provided the welding procedures used have been qualified in accordance with the applicable regulatory rules and regulations.
1.2 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents
2.1 Federal Standards:
Code of Federal Regulations Title 46, Shipping, Parts 30 to 40
Code of Federal Regulations Title 46, Shipping, Parts 41 to 69
Code of Federal Regulations Title 46, Shipping, Parts 140 to 149
Rules for Building and Classing Steel Vessels

3. Application, Service, Limitations, and List of Weld Joint Details
3.1 Details of welded joints, including application, service, and limitation notes, are provided in the appropriate figures, as follows:
3.1.1 Butt-Welded Joints for Pipes, Valves, Fittings, and Flanges:
Fig. 1 Butt Joint, Square

3.1.4 Outlet and Boss Connections:
4. Piping Classifications and Butt Weld Reinforcements

4.1 Piping classifications in accordance with Subpart 56.04 of USCG Regulations apply to this specification. For definitions of ABS Group I and II Pipe Connections, see ABS Rules, Section 30, Paragraph 30.13.

4.2 Maximum thickness of butt weld reinforcements in accordance with Subpart 56.70, Table 56.70-15, of USCG Regulations are listed in Table 1.

5. Keywords

5.1 backing ring pipe welds; boss connections; flange welds; miter joint weld; pipe welds; root connections; sleeve pipe welds; socket welds; welded joints

Application—Class II piping

Systems or Service—For services such as gravity drains (including plumbing), vents, and overflows.

Remarks—1. Root of weld need not be ground.

FIG. 1 Butt Joint, Square
Application—Class II piping
System or Service—All provided root of weld is visually inspected where possible to ensure complete weld penetration.
Remarks—1. For services such as vents, overflows, and gravity drains (including plumbing) the root of the weld need not be ground.

FIG. 2 Butt Joint, V-Grooved

Application—Class I and II piping above 2-in. NPS
System or Service—All
Remarks—1. Internal weld shall be made first and ground, chipped, or cleaned by some other means to assure sound welds.
2. The “L” dimension should be held to a minimum to facilitate welding and inspection on the inside surface of the pipe.

FIG. 4 Butt Joint, Double V-Grooved, Welded Both Sides

Application—Class I and II piping above 2-in. NPS
System or Service—All
Remarks—1. Internal weld shall be made first and ground, chipped, or cleaned by some other means to assure sound welds.
2. The “L” dimension should be held to a minimum to facilitate welding and inspection on the inside surface of the pipe.

FIG. 5 Butt Joint, Compound Bevel V-Grooved, Welded Both Sides
Application—Class II piping where use will not cause objectionable pressure drop or turbulence.

System or Service—All provided root of weld is visually inspected where possible to ensure complete weld penetration.

Remarks—1. For services such as vents, overflows, and gravity drains (including plumbing), the root of the weld need not be ground. 2. Miter segments shall be designed in accordance with ANSI B31.1, paragraph 104.33, and 46 CFR 56.07-16(f).

FIG. 6 Butt Joint, V-Grooved, Miter Type

$\frac{1}{16}$ in. = 2 mm

$\frac{1}{8}$ in. = 3 mm

$\frac{3}{16}$ in. = 5 mm

$\frac{3}{8}$ in. = 10 mm

$\frac{1}{4}$ in. = 19 mm

$\frac{7}{8}$ in. = 22 mm

Application—Class I and II piping

System or Service—All, except as noted in remarks

Remarks—1. Backing ring may be tack-welded in place to facilitate fabrication. 2. When used in the following services, backing rings shall be removed.

(A) Lube oil service discharge piping from the lube oil pumps to the reduction gears, HP and LP turbines, and lube oil gravity tank.

(B) Superheated steam outlet piping from the main boilers to the HP and LP turbines and turbo generators and desuperheated steam from the main boilers to turbine driven main feed pumps.

(C) Central hydraulic systems.

1/16 in. = 2 mm
1/4 in. = 6 mm
3/8 in. = 10 mm

Application—Fittings: See Fig. 18. Flanges: See Fig. 19.
System or Service—See Fig. 18 and Fig. 19.
Remarks—1. Size of weld shall be equal to or greater than "T."
2. For Class I piping, depth of insertion of the pipe nipple into the fitting shall not be less than 3/8 in. (10 mm).
3. Weld to be deposited in a minimum of two passes unless specifically approved otherwise in a special procedure qualification.

FIG. 15 Butt Joint, Socket Weld to Socket Weld Valve, Fitting or Flange Welded on Pipe Nipple

FIG. 16 Butt Joint, Transition Between Unequal Inside and Outside Diameter Components

Application—Class I piping 3-in. NPS max where not subject to full radiography by 46 CFR Table 56.95-10. Class II piping all sizes.
System or Service—All
Remarks—1. Size of weld shall be 1 1/4 T min but not less than 1/8 in. (3 mm).
2. For Class I piping, depth of insertion of pipe, tube, or fitting in sleeve shall not be less than 3/8 in. (10 mm).
3. Weld to be deposited in a minimum of two passes unless specifically approved otherwise in a special procedure qualification.
4. For Class I piping, the inside diameter of the sleeve shall not exceed the outside diameter of the pipe, tube, or fitting by more than 0.080 in. (2.03 mm).
5. Couplings may be used with flat or beveled end pipes and fitting.

FIG. 17 Fillet Welded Sleeve-Type Pipe Coupling

Application—Class I piping 3-in. NPS max where not subject to full radiography by 46 CFR Table 56.95-10. Class II piping all sizes.
System or Service—All, except socket welds shall not be used where severe erosion or crevice corrosion is expected to occur.
Remarks—1. Size of weld shall be 1 1/4 T min but not less than 1/8 in. (3 mm).
2. For Class I piping, depth of insertion of pipe or tube into the fitting shall not be less than 3/8 in. (10 mm).
3. Weld to be deposited in a minimum of two passes unless specifically approved otherwise in a special procedure qualification.

FIG. 18 Fillet Welded Socket Weld Fitting or Valve
Application—Class I piping 3-in. NPS max for 600# and lower classes and 2¼-in. NPS for 900 and 1500# classes. 3-in. size not permitted where subject to full radiography by 46 CFR Table 56.95-10. Class II piping all sizes.

System or Service—All, except socket welds shall not be used where severe erosion or crevice corrosion is expected to occur.

Remarks—1. Size of Weld W1 shall be 1.4 T min. for Class II piping, size of weld may be limited to $\frac{17}{32}$ in. (13 mm) max.
2. Weld to be deposited in a minimum of two passes unless specifically approved otherwise in a special procedure qualification.

FIG. 19 Fillet Welded Socket Weld Flange

Application—Class II piping not exceeding 150 psi (1034 kPa) or 450°F (232°C)

System or Service—All

Remarks—1. Size of Weld 8a W1 shall be 1.4 "T" min but may be limited to $\frac{17}{32}$ in. (13 mm).
2. Size of Weld W2 shall be equal to "T" or $\frac{1}{4}$ in. (6 mm), whichever is smaller.
3. Distance X shall be T plus $\frac{1}{16}$ in. (2 mm) min but may be limited to $\frac{3}{8}$ in. (10 mm).

FIG. 20 Double Fillet Welded Slip-on Flange (Forged)

Application—Class I and II piping not to exceed the service pressure temperature ratings for the 300# and lower classes. Slip-on flanges shall not be used on Class I piping where subject to full radiography by 46 CFR Table 56.95-10.

System or Service—All

Remarks—1. Size of Weld W1 shall be 1.4 T min. for Class II piping, size of weld may be limited to $\frac{17}{32}$ in. (13 mm) max.
2. Size of Weld W2 shall be equal to "T" or $\frac{1}{4}$ in. (6 mm), whichever is smaller.
3. Dimension X shall be equal to T plus $\frac{1}{16}$ in. (2 mm) min. for Class II piping. Dimension X may be limited to $\frac{3}{8}$ in. (10 mm).

FIG. 21 Double Fillet Welded Slip-on Flange (Plate Type)
Application—Class II piping not exceeding 150 psi (1034 kPa) or 650°F (343°C)
System or Service—All
Remarks—1. Size of Weld W1 shall be 1.4 "T" min but may be limited to 17/32 in. (13 mm).
2. Size of Weld W2 shall be equal to "T" or 1/4 in. (6 mm), whichever is smaller.
3. Distance X shall be "T" plus 1/8 in. (2 mm) min but may be limited to 3/8 in. (10 mm).

FIG. 22 Fillet Welded Slip-on Flange (Plate-Type) Single Bevel

Application—Class II piping above 2-in. NPS.
System or Service—All, provided root of weld is visually inspected where possible to ensure complete weld penetration.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 0.7 T or 1/4 in. (6 mm), whichever is smaller.
2. For services such as vents, overflows, and gravity drains (including plumbing), the root of the weld need not be ground.

FIG. 23 Fillet Welded Internal Root Connection

Application—Class II piping in Class II piping
System or Service—For services such as vents, overflows, and gravity drains (including plumbing).
Remarks—1. Size of weld shall be T min.
Application—Class I and II piping above 2-in. NPS
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 0.7 T or ¼ in. (6 mm), whichever is smaller.
2. Internal weld shall be made first and ground, chipped, or cleaned by some other means to assure sound welds.
3. The “L” dimension should be held to a minimum to facilitate welding and inspection on the inside surface of the pipe.

FIG. 26 Fillet Reinforced External Root Connection, Single Bevel, Welded Both Sides

Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 0.7 T or ¼ in. (6 mm), whichever is smaller.
2. After welding, backing ring shall be machined flush with inside diameter of pipe.

FIG. 27 Fillet Reinforced External Root Conn, Single Bevel, Welded with Square End Backing Ring

Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of ¼ in. (6 mm).

FIG. 28 Fillet Reinforced Internal Root Conn, Single Bevel, Welded With Square End Backing Ring

Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of ¼ in. (6 mm).

FIG. 29 Fillet Reinforced Boss Conn Without Pilot, Single Bevel
Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 1/4 in. (6 mm).
2. Pilot hole shall be 1/32 in. (1 mm) larger than pilot diameter.
3. Final bore after welding shall be a minimum of 1/8 in. (3 mm) larger than pilot diameter.

**FIG. 30 Fillet Reinforced Boss Conn with Pilot, Single Bevel**

Application—Class II piping.
System or Service—All, provided root of weld is visually inspected where possible to ensure complete weld penetration.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 1/4 in. (6 mm).
2. For services such as vents, overflows, and gravity drains (including plumbing), the root of the weld need not be ground.

**FIG. 32 Fillet Reinforced External Root Conn, Single Bevel with Integrally Reinforced Outlet**

Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 1/4 in. (6 mm).
2. Internal weld shall be made first and ground, chipped, or cleaned by some other means to assure sound welds.

**FIG. 33 Fillet Reinforced External Root Conn Welded Both Sides, Single Bevel with Integrally Reinforced Outlet**

Application—Class I and II piping.
System or Service—All.
Remarks—1. Reinforcing fillet S shall have a minimum throat dimension of 1/4 in. (6 mm).
2. Final bore after welding shall be a minimum of 1/8 in. (3 mm) larger than pilot diameter.

**FIG. 31 Fillet Reinforced Boss Conn (Couplet) with Integral Backing Ring**
Standard Specification for Wildcats, Ship Anchor Chain

This standard is issued under the fixed designation F 765; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers wildcats as used in windlasses to haul in and pay out anchor chain on board ships. An associated chain stopper is used to secure the chain while the ship is anchored, or the anchor is housed.

1.2 Wildcats are of the five whelp type for use with stud link anchor chain conforming to the American Bureau of Shipping Grades 1, 2, and 3. Wildcat dimensions are provided for chains in integral 1/8-in. (3-mm) steps, ranging in size from 3/4 to 4 1/8 in. (19 to 104 mm). Wildcat dimensions for chains in intermediate 1/16-in. (1.5-mm) steps are not provided, but wildcats in these sizes are permitted within the scope of this specification.

1.3 Wildcats are configured to pass detachable links oriented parallel or perpendicular to the wildcat shaft centerline.

1.4 The values stated in inch-pound units are to be regarded as the standard. This specification is for use with anchor chain that is measured in inch-pound units.

2. Referenced Documents

2.1 ASTM Standards:
A 27/A 27M Specification for Steel Castings, Carbon, for General Application
A 36/A 36M Specification for Structural Steel
A 148/A 148M Specification for Steel Castings, High-Strength, for Structural Purposes
E 10 Test Method for Brinell Hardness of Metallic Materials

2.2 Other Documents:
American Bureau of Shipping, Rules for Building and Classing Steel Vessels, Section 43.11 Equipment
American Welding Society Structural Welding Code, Chapter D1.1

3. Classification

3.1 The size of the wildcat is identified by the chain size.

3.2 Wildcats are furnished in four types as follows:

3.2.1 Type I—Fabricated from structural steel plate for flanges, hubs, whelps, and chain pockets, joined by electric welding. Surface hardness is approximately 150 HB.

3.2.2 Type II—Fabricated from structural steel plate for flanges, hubs, and chain pockets; and high-strength steel castings for whelps, joined by electric welding. Surface hardness is approximately 150 HB for flanges and hubs and 300 HB for whelps.

3.2.3 Type III—Cast from medium-strength carbon steel castings to provide a surface hardness of approximately 150 HB.

3.2.4 Type IV—Cast from high-strength steel castings to provide a surface hardness of approximately 300 HB.

4. Descriptions of Terms

4.1 chain groove—circumferential groove at the chain centerline to provide clearance for links passing normal to the wildcat shaft centerline.

4.2 chain pockets—recesses between the flanges and whelps into which links with flat side orientated parallel to the wildcat shaft centering lay.

4.3 detachable link—a “C” shaped link, closed by means of a pair of closing pieces and a taper pin, and used to join anchor chain lengths and appendages into a continuous length aboard ship.

4.4 flanges—circumferential rims on the outside of the whelps, chain pockets, and chain groove.

4.5 link grip—the inside dimension of a chain link representing the effective length of a chain link in an assembled chain. Generally four times the nominal size of a stud link anchor chain, see Fig. 1.

4.6 whelps—protrusions on the inside of the flanges of the wildcat that resemble gear teeth and of such shape and
dimensions so as to follow the path of the chain, as it enters and leaves the wildcat. Faces of protrusions are separated by the chain groove to permit links with the flat side normal to the wildcat shaft centerline to pass, but blocking links with the flat side oriented parallel to the wildcat shaft centerline.

4.7 **wildcat**—a rotating member specially contoured to receive assembled chain links and connecting links around the circumference of the member and of suitable strength to impart motion to the chain when rotated.

5. **Ordering Information**

5.1 Orders for wildcats under this specification shall include the following:

5.1.1 Quantity (number),
5.1.2 Size (chain size),
5.1.3 ASTM designation and date of issue,
5.1.4 Type (I, II, III, or IV),
5.1.5 Size, grade, and type of chain,
5.1.6 Availability of assembled chain and detachable link to be furnished by the purchaser for test (see Section 9),
5.1.7 As-cast or machined dimensions for wildcat bore, hub width, and outside boss diameter, and
5.1.8 Marking (shipping).

6. **Materials and Manufacture**

6.1 Material for Type I wildcats shall conform to Specification A 36/A 36M for flanges, hubs, whelps, and chain pockets, joined by electric welding in accordance with AWS, structural welding code Chapter D1.1. Type I wildcats in sizes 2 in. and larger shall be stress-relieved. Material for Type II wildcats shall conform to Specification A 36/A 36M for flanges and hubs, and chain pockets, and Specification A 148/A 148M for whelps, joined by electric welding in accordance with AWS, Structural Welding Code, Chapter D1.1, stress-relieved and heat-treated. Material for Type III wildcats shall conform to Specification A 27/A 27M, Grade 70-40, quenched and tempered. Material for Type IV wildcats shall conform to Specification A 148/A 148M, Grade 150-125, quenched and tempered.

6.2 The manufacturer’s name or identification mark, chain size, and pattern or drawing number shall be cast or stamped on the wildcat, using minimum 3/4 -in. (19-mm) size characters. The marking shall not appear on a wearing surface and shall be visible on an assembled windlass.

7. **Dimensions**

7.1 Wildcat must be fitted to the sample chain, and detachable link (see Section 9). Principal dimensions of Types III and IV wildcats for chains in steps of 1/8 in. (3 mm) are shown for information only in Table 1 and Table 2.

7.2 Dimensions in Table 1 and Table 2 are developed in accordance with the following (see also Fig. 2 and Fig. 3):

7.2.1 Bottom of chain pockets are relieved to clear enlargements occurring at centers of chain links as manufactured.

7.2.2 Each face of the whelp is a partial frustrum of a cone developed so that each link whose plane is parallel to the wildcat shaft centerline will have end play as noted in Table 1 and Table 2. This end play provides clearance between non-bearing side of whelp and the end of the next following link, the centerline plane of which is parallel to the axis of shaft.

7.2.3 The inner surfaces of the chain pockets, that form the flanges of the wildcat, are flat surfaces together forming the frustrums of pentagonal pyramids. The traces of the intersections of these flat surfaces or sides of the frustrums coincide with the centerline of the whelps.

7.2.4 The trace of the intersection of the plane at the bottom of the chain pocket and the side of whelp forms a hyperbolic section of a cone and is therefore a curved line.

7.2.5 Wildcat radii are as follows with all dimensions having the same units:

FIG. 2 Wildcat Development
R₃ = mean effective radius, measured to the outside center of a link laying in the displaced position in a pocket,  

\[ R₃ = \sqrt{\frac{g}{0.309 \ 02} + \frac{d}{0.951 \ 06}} \]  

R₄ = L − 3.36d.

8. Workmanship, Finish, and Appearance

8.1 Castings shall be smooth, of fine grain, and free of cracks, hot tears, and blow holes, detrimental to end use.

8.2 Castings shall have all flash material, vents, and gates removed and ground flush to match the surrounding surface.

8.3 Welds shall be extended around the ends of members and be free of pockets and irregularities that would tend to trap water or mud.

8.4 Castings and weldments shall be sand- or shot-blasted to remove all loose scale and slag.

8.5 The outside faces of the wildcat flanges shall be machined to the extent necessary to rotate in true planes.

9. Test Method

9.1 To test the fit of the sample chain on the wildcat, use a nine-link sample consisting of five joined common links, one detachable link, and three joined common links. The sample chain shall be uniform, representative of the chain to be used, and conform to American Bureau of Shipping Grade 1, 2, or 3.

9.2 Wrap the sample chain tightly around the wildcat, starting with the first common link in a pocket (see Fig. 1). The link grip dimension of the closure (gap) shall not exceed the link grip length or be less than the link grip length minus 3/8 times the chain size.

9.3 The dimensions of the wildcat may be reduced by chipping, grinding, or air-arc cutting for an acceptable chain fit. If air-arc cutting is used, not less than the last 1/8 in. (3 mm) of material shall be removed to a smooth contour by grinding. Do not use flame cutting.

9.4 By consent of the purchaser, weld cladding or hard surfacing may be used to build up chain contact surfaces for an acceptable chain fit. The Brinell hardness of the finished weld deposit shall be the same as the adjacent area of the base material, plus or minus 25-HB hardness points for Types I and III, and plus or minus 50-HB hardness points for Types II and IV. Hardness measurements shall be made in accordance with requirements of Test Method E 10.

10. Inspection

10.1 The wildcat shall be visually inspected for workmanship, finish, and appearance, after cleaning by sand- or shot-blasting.

11. Marking (Shipping)

11.1 Each wildcat, when furnished as a separate component, shall be marked with the ASTM designation, purchase order, and item number. Marking shall be by point or weatherproof tag.

12. Packaging

12.1 Wildcats, when furnished as a separate component, shall be crated, skidded, or attached to a pallet in a manner acceptable for handling by a common carrier. When wildcats are furnished with machined bore and hub, machined surfaces shall be protected against corrosion in open weather storage for periods of at least one year.

13. Keywords

13.1 anchor chain; stud link anchor chain; wildcats; windlasses
Standard Specification for Doors, Furniture, Marine

This standard is issued under the fixed designation F 782; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope
1.1 This specification covers the construction of furniture doors for use where invoked by other marine furniture specifications.
1.2 This specification applies to all furniture doors for marine furniture, in items requiring hinged doors.
1.3 Values stated in inch-pound units are to be regarded as the standard. The metric equivalents, given in parentheses, are for information only.

2. Referenced Documents
2.1 ASTM Standards:
A 240 Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels
A 1008/A 1008M Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
A 582/A 582M Specification for Free-Machining Stainless Steel Bars
B 209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
B 221 Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
C 1036 Specification for Flat Glass
D 907 Terminology of Adhesives
2.2 American Institute of Steel Construction Manual:
AISC Wire and Sheet Metal Gages—Equivalent Thickness in Decimals of an Inch, U.S. Standard Gage (USSG) for Uncoated Hot and Cold-Rolled Sheets

3. Terminology
3.1 Definitions of Terms Specific to This Standard:
3.1.1 flush doors—metal doors with a smooth surface on the exterior face.
3.1.2 hinged door—door equipped with hinges that permit it to swing about the vertical hinge axis, either right hand or left hand.
3.1.2.1 right-hand door—door with hinges on the right side when viewed from the exterior of the furniture item containing the door.
3.1.2.2 left-hand door—door with hinges on the left side when viewed from the exterior of the furniture item containing the door.
3.1.3 panel doors—doors with metal stiles and rails that support a panel insert of transparent safety glazing or expanded aluminum.
3.1.3.1 stiles—the vertical members in the frame of a panel door that support the central panel.
3.1.3.2 rails—the horizontal members in the frame of a panel door that support the central panel.

2.3 Federal Specifications:
DD-G-1403 Glass, Plate (Float), Sheet Figured, and Sndrel (Heat Strengthened and Fully Tempered)
LP-391 Plastic Sheets, Rods and Tubing, Rigid Cast, Meth-acrylate (Multiapplication)
QQ-C-320 Chromium Plating (Electrodeposited)
QQ-Z-325 Zinc Coating, Electrodeposited
2.4 American National Standard Institute Standards:

9 Available from American National Standards Institute, 25W. 43rd St., 4th Floor, New York, NY 10036.
4. Classification

4.1 Doors shall be of the following types as required by the specifications for the item of furniture in which they are installed and as indicated in ordering documents. See Fig. 1 for details.

4.1.1 *Type I*—Flush hinged door.
4.1.2 *Type II*—Panel hinged door.

5. Ordering Information

5.1 Doors are included as part of the orders for items of furniture requiring doors. To describe adequately the door or doors required, these orders shall include, as necessary, the following information:

5.1.1 Type.
5.1.2 Size, see Section 8.
5.1.3 Paint:
5.1.3.1 *Color*—Per the purchaser’s requirements.

5.1.3.2 Manufacturer’s standard baked enamel will be furnished unless otherwise required and indicated by the purchaser.

5.1.4 For single-hinged doors, indicate hand if not obvious or if a specific hand is required.

5.1.5 Material for Type II (panel) doors may be either steel or aluminum. Material selected shall be the option of the furniture purchaser.

6. Materials and Manufacture

6.1 For typical design, see Fig. 1.

6.2 Sheet metal shall be cold-rolled steel, commercial quality, furniture grade in accordance with Specification A 1008/A 1008M.

6.3 Aluminum extrusions shall be Type 6063-T6 aluminum alloy in accordance with Specification B 221. Aluminum sheet shall be Type 5052-H32 aluminum alloy in accordance with Specification B 209.

---

**NOTE 1**—Panels of Type I (flush) doors shall be cold-rolled sheet steel, commercial quality, furniture grade in accordance with Specification 366/A 1008/A 1008M, 18 USSG (0.0478 in. or 1.21 mm). Stiffeners shall be applied to front and back as required to prevent buckling or oil-canning.

**NOTE 2**—At the option of the furniture manufacturer the stiles and rails for Type II (panel) door, may be either 18 USSG (0.0478 in. or 1.21 mm) cold-rolled steel, commercial quality, furniture grade in accordance with Specification A 1008/A 1008M or Type 6063-T6 extruded aluminum in accordance with Specification B 221 or 0.064-in. (1.63-mm) thick Type 5052-H32 aluminum alloy sheet in accordance with Specification B 209.

**NOTE 3**—Aluminum Panel inserts for Type II (panel) doors shall be Type 3003-H14 anodized aluminum, 0.081 in. (2.06 mm) thick before expanding and of the Festoon or other approved pattern. Material shall be in accordance with Specification B 209 and the anodizing shall be done after metal is expanded. Alternative safety glazing can be furnished if specified in ordering documents. See 6.11.2.1 for description of these alternatives.

**NOTE 4**—Butt hinges are shown in Fig. 1 and shall be furnished in accordance with 6.8. Type 300 stainless steel pivot or hinges of adequate strength may be used in place of butt hinges.

**NOTE 5**—Stay arms shall be provided and shall both prevent door from opening more than 90° and be capable of retaining door in 90° open position.

**NOTE 6**—Doors shall be equipped with latches. See 6.7.1 and 6.7.2 for description of alternative latches.

**NOTE 7**—Doors shall be capable of resisting vertical load applied at latch edge. See 7.1 for detail of test.

**NOTE 8**—Doors shall be comply with requirements of tilt test. See 7.2 for details of test.

**FIG. 1** Furniture Doors
6.4 Joining of metal parts:

6.4.1 Metal components shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907.

6.4.2 Joining shall be adequate to prevent racking during handling.

6.4.3 Spotwelds shall be spaced approximately 3 in. (76.2 mm) on centers.

6.4.4 Visible spotwelds on exterior face of door higher than the general surface of the metal shall be ground flush.

6.4.5 Visible spotweld depressions shall be spot filled and sanded flush.

6.5 All doors shall be square and form a plane through the four corners.

6.6 All doors shall incorporate a latch or other positive means to prevent opening in heavy seas. Spring, bullet, magnetic, or bayonet-type catches shall not be permitted. Furniture doors shall not open when furniture unit in which door is installed is tilted a maximum of 30° from the vertical.

6.7 Latches for doors shall be one of the two following types as selected by the furniture purchaser:

6.7.1 Mortise type of brass, bronze, or stainless steel, attached with stainless steel fasteners. Exposed brass or yellow bronze parts shall be Class I, Type II chrome plated in accordance with Federal Specification QQ-C-320. Exposed stainless steel and white bronze parts shall have a brushed finish. White bronze shall be covered with a clear protective coating of lacquer or other similar covering.

6.7.2 Two point latching rod system with hardware similar to that in use for marine type furniture doors. Disk tumbler cam locks may be used to prevent rods from unlatching. Omit dummy hardware on inactive door for double door applications. Disk tumbler cam locks shall have 90° rotation with screwed on or spun-on cap attachment. Cylinders shall be die-cast zinc with exposed surfaces finished in satin nickel-plated US-15 finish.

6.8 Hinges shall be provided and shall be Type 300 stainless steel in accordance with Specification A 240 with a Type 300 stainless steel pin in accordance with Specification A 582. Hinges shall be of adequate size Please find the attached proof copy of F 2119. Please make sure that it has been edited correctly. I will bring any questions/concerns that you have to the F 04 editor, Kathy Peters. Please respond on or before September 14, 2001. After this date, F 2119 will be published as a separate. Thank you for your time. with 1⁄16-in. (1.59-mm) thick leaves and secured with Type 300 stainless steel or zinc-plated steel fasteners. Zinc-plated fasteners shall be in accordance with QQ-Z-325 Cl 2, Ty 1. Type 300 stainless steel pivot or piano hinges of adequate strength may be used in place of butt hinges.

6.9 Stay arms shall be provided and shall prevent door from opening more than 90° and be capable of retaining door in 90° open position.

6.10 Type I (flush) doors shall have additional requirements as follows:

6.10.1 Front and/or back panels shall be cold-rolled sheet steel, commercial quality, furniture grade in accordance with Specification A 1008/A 1008M, 18 USSG (0.0478 in. or 1.21 mm).

6.10.2 Stiffener shall be applied to front and/or back panels as required to prevent buckling or oil-canning.

6.11 Type II (panel) doors shall have the additional requirements as follows:

6.11.1 At the option of the furniture manufacturer, the stiles and rails may be either 18 U.S.S.G (0.0478-in. 1.21-mm) cold-rolled steel, commercial quality, furniture grade in accordance with Specification A 1008/A 1008M, Type 6063-T6 extruded aluminum alloy in accordance with Specification B 221, or 0.064-in. (1.63-mm) thick Type 5052-H32 aluminum alloy sheet in accordance with Specification B 209.

6.11.2 Panel Inserts—Unless otherwise specified in ordering documents, panel inserts shall be expanded aluminum in accordance with 6.11.2.2.

6.11.2.1 Panel inserts of transparent safety glazing shall be either 3/16-in. (4.76 mm) thick safety glass, of the heat-treated or laminated type, or 3⁄16-in. (4.76-mm) thick acrylic sheet. Material specifications for these transparent panel inserts are as follows: heat-treated safety glass in accordance with Specification C 1036 and Federal Specification DD-G-1403; laminated safety glass in accordance with Specification C 1036; acrylic sheet in accordance with Federal Specification LP-391. In addition, all transparent safety glazing shall meet the pertinent safety requirements of ANSI Specification Z97.1-1975.

6.11.2.2 Expanded aluminum panel inserts shall be Type 3003-H14 anodized aluminum, 0.081 in. (2.06 mm) thick before expanding, and of the Festoon or other approved pattern. Material shall be in accordance with Specification B 209 and the anodizing shall be done after metal is expanded.

6.11.3 Provision for supporting and replacing the panel inserts shall be made.

7. Performance Requirements

7.1 Doors shall be capable of supporting a vertical load of 100 lb (45.4 kg), applied at the lock edge of door, with door in any position from 10° open to 90° open. Load shall remain on door for a minimum of 3 min and there shall be no indication of permanent set after removal of load.

7.2 Tilt Test—Doors shall remain latched in closed position when the furniture unit in which they are installed is tilted 30° from the vertical in the plane that would induce the greatest tendency for door to open. Leave door in this attitude for a minimum of three minutes.

8. Dimensions

8.1 For dimensions, see Table of Dimensions under Fig. 1.

8.2 Doors shall be made to a size that suits the furniture item in which they are installed.

9. Workmanship, Finish, and Quality Assurance

9.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice to produce each item for its intended use.
9.2 All exposed burrs, raw, or sharp edges that might be injurious to personnel shall be removed.
9.3 Depressions considered unacceptable for product’s end use shall be spot filled and sanded smooth.
9.4 Finish:
9.4.1 All steel surfaces, unless corrosion-resistant or with a corrosion-resistant plating, shall be painted so as to prevent corrosion.
9.4.2 Unless otherwise required by the furniture specification, all normally visible parts of completed unit shall have the manufacturer’s standard baked-on enamel finish.
9.4.3 Color—Doors shall be painted per the purchaser’s color requirements.

10. Inspection and Certification
10.1 Inspection and certification requirements of furniture item in which door (or doors) are installed shall govern.

11. Packaging and Package Marking
11.1 Each door shall be installed in its respective furniture item prior to shipment. Marking and packaging requirements of furniture item shall govern.

12. Keywords
12.1 doors; flush hinged door; furniture; furniture doors; hinged doors; marine; marine furniture; panel hinged door; ship
Standard Specification for
Staple, Handgrab, Handle, and Stirrup Rung

1. Scope
1.1 This specification provides design, construction for steel staples, handgrabs, handles, and individual stirrup rungs.
1.2 The staples, handgrabs, and handles depicted in this specification are for use on steel structures including all parts of ships’ structure as necessary. The individual stirrup rungs are for use on bulkheads or structure as deemed necessary.
1.3 Values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents
2.1 ASTM Standards: 2
   A 575 Specification for Steel Bars, Carbon, Merchant Quality, M-Grades

3. Terminology
3.1 Definitions of Terms Specific to This Standard:
3.1.1 handgrab or handle—bent round bar of various sizes for use on miscellaneous hatch covers, manholes, above access openings, and so forth.
3.1.2 staple—a U-shaped round bar of various sizes used to provide an anchor end for lashings, portable chain connections, lifting slings, and so forth.
3.1.3 stirrup rung—a double-bend-shaped square bar intended for use as a single step or supplementary steps in place of a vertical ladder.

4. Ordering Data
4.1 The purchaser’s ordering data shall include the following:
4.1.1 Quantity, size, and type.
4.1.2 Finish if other than specified in 7.1 and 7.2.

5. Materials and Manufacture
5.1 Staple, handgrab, handle, and stirrup rung shall be made of steel in accordance with Grade M 1020 of Specification A 575.

6. Dimensions
6.1 Dimensions of staple shall be as indicated in Table 1.
6.2 Dimensions of handgrab and handle shall be as indicated in Table 2.
6.3 Dimension of stirrup rung shall be as indicated in Table 3.
6.4 Dimensions are given in inches; millimetre equivalents appear in parentheses, and apply to this specification only.

7. Finish
7.1 Unless otherwise required by the ordering data, manufacturer’s standard sandblast shall be acceptable. All rough edges shall be dressed smooth by grinding.
7.2 Unless otherwise required by the ordering data, all staples, handgrabs, handles, and stirrup rungs shall be coated with a nonhazardous corrosion inhibiting primer coating by the manufacturer.

8. Product Marking
8.1 Each staple, handgrab, handle, and stirrup rung shall be marked with the purchase order number, item number from purchase order, ASTM designation number, and manufacturer’s name. Marking may be by paint, stencil, or weatherproof tag.

9. Packaging and Package Marking
9.1 Packaging shall be provided and be acceptable to a common carrier.

10. Keywords
10.1 bulkheads; handgrabs; handles; marine steel structures; stirrup rung

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
1. Scope

1.1 This specification covers the construction of standard and custom-built interior steel doors and frames for ships including U.S. Coast Guard certificated vessels with domestic routes.

1.2 Doors and frames are to be hollow metal construction with the door insulated for sound or fire.

1.3 The doors are intended for use in staterooms, lavatories, passageways, and other areas protected from weather.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other.

2. Referenced Documents

Subchapter D—Tank Vessels, Subpart 32.57—Structural Fire Protection
Subchapter H—Passenger Vessels, Subpart 72.05—Structural Fire Protection
Subchapter I—Cargo and Miscellaneous Vessels, Subpart 92.07—Structural Fire Protection
Subchapter T—Small Passenger Vessels, Subpart 177.300—Hull Structure
Subchapter U—Oceanographic Vessels, Subpart 190.07—Structural Fire Protection
Structural Insulations, Subpart 164.007
Noncombustible Materials for Merchant Vessels, Subpart 164.009
Noncombustible Materials, Subpart 164.109

2.3 Builders Hardware Manufacturers Association, Inc.: A 156.18 Materials and Finishes

2.4 U.S. Public Health Service: Publication No. 393, Handbook on Sanitation of Vessel Construction

3. Terminology

3.1 Definitions of Terms Specific to This Standard:
3.1.1 hands of doors—a term used to describe a door from the outside or key side of the door.
3.1.2 right-hand regular door—a door having hinges on the right side when swinging door away from the individual opening it.
3.1.3 left-hand regular door—a door having hinges on the left side when swinging door away from the individual opening it.
3.1.4 right-hand reverse bevel door—a door having hinges on right side when swinging door towards the individual opening it.
3.1.5 left-hand reverse bevel door—a door having hinges on left side when swinging door towards the individual opening it.
3.1.6 face plates—the exterior metal skins that enclose the internal supporting structure of the door.
3.1.7 latch—a device normally installed in the vertical edge of door, opposite hinge edge, that when latched retains door in closed position.

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting.

3 Annual Book of ASTM Standards, Vol 01.05.

7 Available from United States Public Health Services, Division of Engineering Services, Parklawn Library, Room 1315, 5600 Fishers Lane, Rockville, MD 20857, Attention: Ms. Bonnie Scott.
3.1.8 *throw*—the extension, or reach, of the latch bolt. This throw is measured from latch face plate to extreme outer edge of latch bolt with latch bolt in fully extended position.

3.1.9 *padlock eye*—a means for securing door in closed position by the use of a padlock.

4. **Classification**

4.1 Classes of doors and frames shall be as indicated in the ordering information. (See Annex A1 for definition of various class divisions.)

4.1.1 Class A-O for installation in Class A-O divisions.

4.1.2 Class A for installation in Class A-15, A-30, and A-60 divisions.

4.1.3 Class B for installation in Class B divisions.

4.1.4 Class C for installation in Class C divisions.

4.2 Doors and frames shall be of the following types as indicated in ordering information.

4.2.1 Type I standard doors are of the following widths. Height and details shall conform to Tables 1-6 and Figs. 1-3.

Size 1—22-in. (559-mm) clear jamb width

Size 2—24-in. (610-mm) clear jamb width

Size 3—26-in. (660-mm) clear jamb width

Size 4—30-in. (762-mm) clear jamb width

Size 5—36-in. (914-mm) clear jamb width

4.2.2 Type II doors conforming generally to specifications but requiring special requirements as indicated in the ordering information (see also 6.7.9).

4.2.3 Type III double doors using two of Type I doors.

4.2.4 Type IV double doors using two of Type II doors.

**NOTE 1**—Door widths are approximately 1 1/4 in. (approximately 32 mm) greater than clear jamb width.

5. **Ordering Information**

5.1 Orders for items under this specification shall include the following information by the purchaser:

5.1.1 Class A-O, A, B, or C.

5.1.2 Type, hand, clear jamb width, and sill height.

5.1.3 Options such as vent grills, louvers, vision lights, and hose ports.

5.1.4 Hardware, sill caps, lock sets, latches, door closers, and hold backs if other than manufacturer’s standard. Master keying of door locks will not be provided unless required and defined by ordering documents. Instead, each door lock will be keyed differently.

5.1.5 Color chip and desired painting specifications or other commercial designation for final finish. If not specified, doors will have manufacturer’s prime coat applied.

5.1.6 For Type II and III doors, sizes and any other supplementary requirements.

5.1.7 *Sill Heights*—0 in. (0 mm), 1½ in. (38 mm), or 6 in. (152 mm). See Figs. 1-3.

5.1.8 Cut out for light switch; if not requested in ordering data, no provisions will be made.

6. **Materials and Manufacture**

6.1 For typical design, see Figs. 1-3.

6.2 Steel for doors and frames shall be cold-rolled sheet, commercial quality in accordance with Specification A 1008/A 1008M. Other materials shall be as indicated.

6.3 Class A-O Doors (See Fig. 1 and Table 1 and Table 2):

6.3.1 Door shall be 1¼-in. (45-mm) thick hollow steel with 0.055-in. (1.4-mm) minimum face plates or equivalent metal construction.

6.3.2 Doors shall have a latch with a minimum throw of ¾ in. (19 mm).

6.3.3 Door frames shall be of steel with a nominal thickness of 0.055 in. (1.4 mm) and shall be installed so that any flame penetration would be through at least two thicknesses of 0.055 in. (1.4 mm) or equivalent.

6.3.4 Door frames shall provide a stop of 1/8 in. (16 mm) minimum at the sides and top.

6.3.5 For undercut at bottom of door, see Fig. 1 and Table 2.

6.3.6 Doors other than those that are normally locked shall be self closing and capable of closing against a 3½° list.

6.3.7 Doors shall be insulated with sufficient noncombustible fibrous insulation to sound dampen the door adequately. This insulation shall be selected from those listed under Section 164.007, Structural Insulations, or Section 164.009, Noncombustible Materials.

6.3.8 *Options for Class A-O and A Doors*:

6.3.8.1 Vision lights may be installed using wire-inserted glass of not more than 100 in.² (645 cm²) in size.

6.3.8.2 An escape panel of 16- by 18-in. (406- by 457-mm) minimum size in lower half of door.

6.3.9 Note: Undercut at bottom of door, see Fig. 1 and Table 2.
6.3.8.3 Where hose ports are required, they shall be cut in the lower corner of the door on the side opposite the hinges so that when hose is passed through the door when the door is open, it may be closed over the hose. The cut for the host port should be approximately 8 by 8 in. (200 by 200 mm). A hinged or pivoted steel metal cover shall be fitted in the cut, equipped with a method of holding it in a closed position yet will permit easy and automatic operation of the hinged cover. See Fig. 1 for location.

6.4 **Class A Doors** (see Fig. 1 and Table 1 and Table 2):

6.4.1 Doors and frames shall follow the requirements of 6.3.1-6.3.6 and 6.3.8.

6.4.2 Doors shall be filled solidly with one half the thickness of structural insulation with USCG Approval Number 164.007. Insulation with USCG Approval Number 164.107 (A-15 rating) may also be used.

6.5 **Class B doors** (see Fig. 2 and Table 3 and Table 4):

6.5.1 Doors shall be 1¾-in. (45-mm) thick hollow steel and constructed of a minimum of 0.044-in. (1.1-mm) face plates.

6.5.2 Doors shall have a latch with a minimum throw of ½ in. (13 mm).

6.5.3 Door frames shall be steel with a minimum 0.055-in. (1.4-mm) thickness if they are an open channel design and a minimum 0.044 in. (1.1 mm) if they are a tubular design. Aluminum construction is acceptable and other noncombustible materials will also be considered.

6.5.4 Door frames shall provide a stop of 5/8 in. (16 mm) minimum at the sides and top.

6.5.5 For undercut at bottom of door, see Fig. 2 and Table 4.

6.5.6 Doors shall be insulated with sufficient noncombustible insulation to sound damp the door adequately. This insulation shall be selected from one of the following USCG approval categories: 164.007, 164.009, 164.107, or 164.109.

6.5.7 **Options for Class B Doors**:

6.5.7.1 Doors may be fitted with any amount of wire inserted glass, as door construction permits.

6.5.7.2 The lower half of such doors may have a louver. The total net area of louver plus any door undercut shall not exceed 78 in.² (0.05 m²).

6.5.7.3 An escape panel of 16- by 18-in. (406- by 457-mm) minimum size.

6.6 **Class C Doors** (see Fig. 3 and Table 5 and Table 6):

6.6.1 Doors shall be 1¾-in. (45-mm) thick hollow steel and constructed of 0.044-in. (1.1-mm) face plates. Aluminum construction is acceptable and other noncombustible materials will also be considered.

6.6.2 Doors shall have a latch with a minimum throw of ½ in. (13 mm).

6.6.3 Door frames shall be steel with a minimum 0.055 in. (1.4 mm) if they are an open channel design and a minimum 0.044 in. (1.1 mm) if they are a tubular design. Aluminum construction is acceptable and other noncombustible materials will also be considered.

6.6.4 Door frames shall provide a stop of ⅜ in. (16 mm) minimum at the sides and top.

6.6.5 For undercut at bottom of door, see Fig. 3 and Table 6.

6.6.6 Doors shall be insulated with sufficient noncombustible fibrous insulation to sound damp the door adequately. This insulation shall be selected from those listed in the Section 164.007, Structural Insulations, or Section 164.009, Noncombustible Materials.

6.6.7 **Options for Class C Doors**:

6.6.7.1 Doors may be fitted with any amount of clear safety glass (laminated or heat treated) as door construction permits.

6.6.7.2 There are no restrictions on louver size, except that dictated by door size and construction.

6.6.7.3 Padlock eyes for crew wardrobes may be furnished if specified in ordering information, see Fig. 3 for location.

6.7 **Other Requirements for All Doors**:

6.7.1 Doors and frames shall be made square and parallel to vessel baseline, without sheer or camber.

6.7.2 Sills or sill caps shall be Series 300 stainless steel in accordance with Specification A 240/A 240M with a mill finish.

6.7.3 Where glass is required in doors, it shall be at least ¼ in. (6 mm) thick.

6.7.4 Double doors capable of independent operation and latching shall have a clearance between doors not to exceed ⅛ in. (3 mm). Double doors incapable of independent operation shall have a ½-in. (13-mm) stop or astragal between doors.

6.7.5 Doors that require door closers shall be reinforced in way of attachments to door and frame. Doors that require hold open hooks and bumpers shall be reinforced in way of attachment to the door.

⁴In passageways and areas in which ratproofing requirements are invoked, the height of the door undercut shall not exceed ½ in. (13 mm).

⁵Max coaming height under sill is 5 in. (127 mm).
6.7.6 Hinges shall be Series 300 stainless steel in accordance with Specification A 240/A 240M with a Series 300 stainless steel pin in accordance with Specification A 582/A 582M. Where fire performance requirements permit, brass or bronze hinges and fasteners may be used. The hinges shall be mortise type 4½ in. (114 mm) high with ⅛-in. (3-mm) thick leaves with Series 300 stainless steel fasteners.

6.7.6.1 All doors shall be equipped with three hinges, equally spaced. Suitable reinforcements shall be installed in doors and frames to support all hinges properly.

6.7.7 Locksets shall be heavy-duty design, key in knob type, with Series 300 stainless steel mechanism. Knob roses and other exposed parts may be brass or bronze, chrome plated per BHMA A 156.18, finish code number 626 or equivalent brushed finish Series 300 stainless steel.

6.7.8 Where construction of door and frame is of steel, it shall be of welded construction with spot welds spaced 6 in. (152 mm) on centers or equivalent arc welds.

6.7.9 Special Construction—The following special construction will be furnished only if specified in ordering information.

6.7.9.1 Dutch doors will be furnished with hinged shelf of Series 300 stainless steel in accordance with Specification A 240/A 240M fitted to bottom half of door. Unless specified otherwise in ordering documents, width of hinged shelf shall be 8 in. (200 mm). Bottom half shall be fitted with lock as for similar doors and with slide bolt between door halves. Padlock eyes or custom seal eyes shall be provided if specified.

6.7.9.2 Double-acting doors, doors equipped with hinges that permit doors to swing both ways, with double bevel latch bolt or dead lock with key on outside and thumb turns on inside.

6.7.9.3 Fume tight door with gasket installed in stop of door frame and around the entire perimeter of door.

6.7.9.4 Door with acoustically lined louver shall have a noise reduction factor equal to that of the joiner bulkhead in
which it is hung or 20 decibels, whichever is lowest. Door frames shall be equipped with gasket similar to that for a fume tight door.

6.7.10 Operating Requirements:

6.7.10.1 All doors shall be capable of operation from either side by one person. Doors shall swing easily and freely on their hinges. The latch set or lock set shall operate freely.

6.7.10.2 Wherever practicable, interior doors are to open into compartments served and not into passageways. In public spaces, stairway enclosures, corridor exits, and so forth, all doors shall open in the direction of escape where practicable.

6.7.10.3 If it is desirable to use decorative doors in addition to those required, they shall be constructed of material classified as noncombustible by CFR 46, Subpart 164.009 and 164.109. These decorative doors shall not interfere with the normal operation of the required doors, and shall open in the same direction if the required doors are in a main avenue of escape.

7. Dimensions

7.1 For dimensions, see Tables 1 and 6.

8. Workmanship and Quality Assurance

8.1 All workmanship and materials to be of specified quality in keeping with this specification and the best commercial marine practice so as to produce each item suitable for its intended use. Doors and frames shall be visually inspected for any defects.

9. Finish

9.1 All steel, unless corrosion resistant or with corrosion-resistant plating, shall be cleaned and a commercial prime coat applied unless otherwise required by the ordering data.

9.2 All exposed burrs and raw or sharp edges on doors and frames which might be injurious to personnel shall be removed.

10. Certification

10.1 The producer or manufacturer shall furnish to the purchaser a certification that the doors and frames were manufactured and inspected in accordance with this specification and have been found to meet the requirements.

11. Packaging

11.1 Packaging shall be provided and be acceptable to a common carrier.

12. Keywords

12.1 A Class doors; B Class doors; C Class doors; hollow metal construction; interior steel doors; marine doors; marine frames; ships; steel doors

ANNEX

(Mandatory Information)

A1. DEFINITIONS OF INTERIOR DIVISIONS—JOINERWORK

A1.1 Class A Construction—Bulkheads, decks, and related structure of steel or equivalent metal construction made intact with the main structure of the vessel. Class A construction shall be capable of preventing the passage of smoke and flame for 1 h. If of steel, the minimum thickness for Class A construction of 0.1196 in. or 3.0 mm. Doors and other penetrations must be constructed to the same requirement to provide this integrity. Class A-O division have no insulating requirements but by the addition of approved structural insulations, Class A divisions can prevent thermal conduction of heat to the unexposed side of the division for time periods of 60, 30, or 15 min as required for Classes A-60, A-30, and A-15, respectively.

A1.2 Approved Structural Insulation—Noncombustible insulation that has been subjected to an approved fire test (CFR 46 164.007) and, in the proper, approved thickness, prevents the average temperature rise on the unexposed side from rising more than 250°F (139°C) above ambient and also prevents the temperature of one point from rising more than 325°F (180°C) above ambient for a period of 1 h.

A1.3 Class B Construction—Noncombustible bulkheads that are capable of preventing the passage of flame for 30 min.

A1.4 Class C Construction—Bulkheads or decks constructed of noncombustible materials.
A1.5 Noncombustible Material—Any material that has been subjected to an approved fire test (CFR 46 164.009 or Test Method E 136).

A1.5.1 Average Weight Loss—Not more than 50 %.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for
Chest of Drawers (Chiffonier), Steel, Marine

This standard is issued under the fixed designation F 822; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the construction of marine chests of drawers (chiffoniers) of steel construction to be used in staterooms and other spaces.

1.2 Values stated in inch-pound units are to be regarded as the standard. The metric equivalents, given in parentheses, are provided for information only.

2. Referenced Documents

2.1 ASTM Standards:
A 366/A 366M Specification for Commercial Steel (CS) Sheet, Carbon, (0.15 Maximum Percent) Cold-Rolled
D 907 Terminology of Adhesives
F 825 Specification for Drawers, Furniture, Marine, Steel
F 826 Specification for Tops, Furniture, Marine, Steel
2.2 American Institute of Steel Construction Manual:
AISC Wire and Sheet Metal Gages— Equivalent Thickness in Decimals of an Inch, U.S. Standard Gauge for Uncoated Hot and Cold Rolled Sheets

3. Terminology

3.1 Definitions of Terms Specific to This Standard:
3.1.1 chest of drawers (chiffonier)—a chest of drawers with four drawers. All four drawers may be of the same size.

4. Ordering Information

4.1 Orders for items purchased under this specification shall include the following information:
4.1.1 Quantity.
4.1.2 Paint:
4.1.2.1 Color—Purchaser shall pick from manufacturer’s samples or submit sample chip of color desired.

4.1.2.2 Manufacturer’s standard baked enamel will be furnished unless otherwise required and indicated by the purchaser.
4.1.3 Options for Tops:
4.1.3.1 Unless otherwise specified in the ordering documents, the top supplied by the furniture manufacturer may be, at his option, Type I, II, III, or IV in accordance with Specification F 826.
4.1.3.2 Color or pattern of top covering material shall be specified.
4.1.4 Options for Drawers:
4.1.4.1 Padlock eyes shall be furnished on each drawer when specified in ordering documents. This security device is normally used in crew living spaces.
4.1.4.2 Drawer locks shall be furnished when specified in ordering documents. Master keying of drawer locks will not be provided unless required and defined by the ordering documents. Instead, each drawer lock will be keyed differently. See Specification F 825 for lock description.
4.1.4.3 A security panel between the two middle drawers to provide two secure two-drawer storage areas for two crew members is only furnished when specified in ordering documents. All four drawers in this type chest will be of same size.
4.1.5 If the total weight of the chest of drawers is required, it shall be requested by the purchaser.

5. Materials and Manufacture

5.1 For typical design, see Fig. 1.
5.2 Sheet metal shall be in accordance with Specification A 366/A 366M, commercial quality.
5.2.1 Minimum sheet metal thicknesses shall be:
5.2.1.1 Sides and front rails 18 USSG (0.0478 in. or 1.2 mm).
5.2.1.2 Back 20 USSG (0.0359 in. or 0.9 mm).
5.2.1.3 Base frame 16 USSG (0.0598 in. or 1.5 mm).
5.3 Joining of Metal Components:
5.3.1 Metal components shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907. The back panel may be riveted to the case provided rivets are not visible after installation.
5.3.2 Joining shall be adequate to prevent racking of chest during handling.
5.3.3 Spotwelds shall be spaced approximately 3 in. (76 mm) on centers.

5.3.4 Visible spotwelds, higher than the general surface of the adjacent metal, shall be ground flush.

5.3.5 Visible spotweld depressions shall be spot filled and sanded flush.

5.4 Side panels shall be suitably stiffened to prevent buckling or oil-canning.

5.5 Sound deadening shall be vermin proof and applied to back and inner face of sides of chest. Location and thickness of applied sound deadener shall be as required to sound-deaden chest.

5.6 Top shall be manufactured in accordance with Specification F 826.

5.7 Drawers shall be manufactured in accordance with Specification F 825.

5.8 A furniture base shall be provided suitable for securing chest of drawers to deck.

6. Performance Requirements

6.1 The completed chest of drawers, with the top and drawers installed, shall satisfy the corresponding performance requirements outlined in Specifications F 825 and F 826.

7. Dimensions

7.1 For dimensions, see Table 1.

*Note 1—For description of Type I, II, III, and IV tops, see Specification F 826.

Note 2—For description of drawers, see Specification F 825.

Note 3—For optional security panel, see 4.1.4.3.

Note 4—If chest of drawers is located in a corner, Dimension “E” next to this adjacent wall shall be 0 in. (0 mm). In all other cases, the minimum value for Dimension “E” shall be 3/4 in. (19.05 mm).

Note 5—The minimum value for Dimension “F” shall be 4 in. (102 mm).

FIG. 1 Chest of Drawers

A furniture base shall be provided suitable for securing chest of drawers to deck.

8. Workmanship, Finish, and Quality Assurance

8.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice so as to produce each item suitable for its intended use.

8.2 All exposed burrs, raw or sharp edges which might be injurious to personnel shall be removed.

8.3 Depressions considered unacceptable for products end use shall be spot filled and sanded smooth.
8.4 Finish:
8.4.1 All steel surfaces, unless corrosion resistant or with a corrosion-resistant plating, shall be painted so as to prevent corrosion.
8.4.2 Unless otherwise required by the ordering documents, all parts normally visible on the completed unit shall have the manufacturer’s standard baked-on enamel finish.
8.4.3 Color is to be specified in the ordering documents.

9. Inspection and Certification
9.1 Manufacturer shall inspect and certify that the item of furniture complies with the furniture specification and the loading requirements as defined in Section 6.

10. Packaging and Package Marking
10.1 Each item shall be marked in accordance with the purchase order.
10.2 Packaging shall be provided and shall be acceptable to a common carrier.

11. Keywords
11.1 chest of drawers; chiffoniers; marine chest of drawers; marine furniture
Designation: F 823 – 93 (Reapproved 1999)

An American National Standard

Standard Specification for
Desk, Log, Marine, Steel, with Cabinet

This standard is issued under the fixed designation F 823; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the construction of marine log desks of steel construction with cabinets.

1.2 Values stated in inch-pound units are to be regarded as the standard. The metric equivalents, given in parentheses, are provided for information only.

2. Referenced Documents

2.1 ASTM Standards:

A 366/A 366M Specification for Commercial Steel (CS) Sheet, Carbon, (0.15 Maximum Percent) Cold-Rolled

D 907 Terminology of Adhesives

F 782 Specification for Doors, Furniture, Marine

F 825 Specification for Drawers, Furniture, Marine, Steel

F 826 Specification for Tops, Furniture, Marine, Steel

2.2 American Institute of Steel Construction Manual:

AISC Wire and Sheet Metal Gages— Equivalent Thickness in Decimals of an Inch, U.S. Standard Gage for Uncoated Hot and Cold Rolled Sheets

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 log desk with cabinet—a desk with attached cabinet located in various places aboard ship for making records and for storage. Log desk has a drawer with a writing surface at the top and a cabinet with adjustable shelves and doors below.

4. Ordering Information

4.1 Orders for items purchased under this specification shall include the following information:

4.1.1 Quantity.

4.1.2 Paint:

4.1.2.1 Color—Purchaser shall pick from manufacturer’s samples or submit sample chip of color desired.

4.1.2.2 Manufacturer’s standard baked enamel will be furnished unless otherwise required and indicated by the purchaser.

4.1.3 Options for Tops:

4.1.3.1 Unless otherwise specified in the ordering documents, the top supplied by the furniture manufacturer may be, at his option, Type I, II, III, or IV in accordance with Specification F 826.

4.1.3.2 Color or pattern of top covering material shall be specified.

4.1.4 Options for Drawers—Drawer locks shall be furnished only when specified in ordering documents. Master keying of drawer locks will not be provided unless required and defined by the ordering documents. See Specification F 825 for lock description.

4.1.5 Options for Doors—Door locks shall be furnished only when specified in ordering documents. Master keying of door locks will not be provided unless required and defined in the ordering documents. Doors shall be Type I in accordance with Specification F 782.

4.1.6 If the total weight of the chest of drawers is required it shall be requested by the purchaser.

5. Materials and Manufacture

5.1 For typical design, see Fig. 1.

5.2 Sheet metal shall be in accordance with Specification A 366/A 366M, commercial quality.

5.2.1 Minimum sheet metal thickness shall be:

5.2.1.1 Sides and front rails 18 USSG (0.0478 in. or 1.2 mm).

5.2.1.2 Back 20 USSG (0.0359 in. or 0.9 mm).

5.2.1.3 Base frame 16 USSG (0.0598 in. or 1.5 mm).

5.3 Joining of Metal Components:

5.3.1 Metal components shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907. The back panel may be riveted to case provided rivets are not visible after installation.

5.3.2 Joining shall be adequate to prevent racking of chest during handling.

5.3.3 Spotwelds shall be spaced approximately 3 in. (76 mm) on centers.

5.3.4 Visible spotwelds, higher than the general surface of the adjacent metal, shall be ground flush.

1 This specification is under the jurisdiction of ASTM Committee F-25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting.

2 Annual Book of ASTM Standards, Vol 01.03.

3 Annual Book of ASTM Standards, Vol 15.06.

4 Annual Book of ASTM Standards, Vol 01.07.

5 Available from the American Institute of Steel Construction, One E. Wacker Dr., Chicago, IL 60601–2001.
5.3.5 Visible spotweld depressions shall be spot filled and sanded flush.

5.4 Side panels shall be stiffened suitably to prevent buckling or oil-canning.

5.5 Sounddeadening shall be vermin proof and applied to back and inner face of sides of chest. Location and thickness of applied sound deadener shall be as required to sound-deaden chest.

5.6 Top shall be manufactured in accordance with Specification F 826.

5.7 Drawers shall be manufactured in accordance with Specification F 825.

5.8 Doors shall be Type I, Grade A and shall be manufactured in accordance with Specification F 782.

5.9 Cabinet section shall be provided with two adjustable shelves.

5.10 Top shall be provided with a pencil tray along back edge.

5.11 A furniture base shall be provided suitable for securing log desk to deck.

6. Performance Requirements

6.1 The completed log desk with cabinet, with top, drawers, and doors installed, shall satisfy the corresponding performance requirements outlined in Specifications F 826, F 825, and F 782.

6. Performance Requirements

7. Dimensions

7.1 For dimensions, see Table 1.

8. Workmanship, Finish, and Quality Assurance

8.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice so as to produce each item suitable for its intended use.

8.2 All exposed burrs, raw or sharp edges which might be injurious to personnel shall be removed.

8.3 Depressions considered unacceptable for product’s end use shall be spot filled and sanded smooth.

8.4 Finish:

8.4.1 All steel surfaces unless corrosion resistant or with a corrosion-resistant plating shall be painted so as to prevent corrosion.

8.4.2 Unless otherwise required by the ordering documents, all parts normally visible on the completed unit shall have the manufacturer’s standard baked-on enamel finish.

8.4.3 Color to be specified in the ordering documents.

9. Inspection and Certification

9.1 Manufacturer shall inspect and certify that the item of furniture complies with the furniture specification and the loading requirements as defined in Section 6.
10. Packaging and Package Marking

10.1 Each item shall be marked in accordance with the purchase order.

10.2 Packaging shall be provided and shall be acceptable to a common carrier.

11. Keywords

11.1 cabinets; log desks; marine furniture; marine log desks; steel log desks

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for
Tables, Mess, Marine, Steel

1. Scope
1.1 This specification covers the construction of round, square, and rectangular marine mess tables with or without adjustable lee rails for use in crew, officer, and passenger dining areas aboard ship.

1.2 The values stated in inch-pound units are to be regarded as the standard. The metric equivalents, given in parentheses, are provided for information only.

2. Referenced Documents
2.1 ASTM Standards:
A 53/A 53M Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless
A 167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
A 240/A 240M Specification for Heat-Resisting Chromium and Nickel-Chromium Stainless Steel Plate, Sheet, and Strip for Pressure Vessels
A 366/A 366M Specification for Commercial Steel (CS) Sheet, Carbon, (0.15 Maximum Percent) Cold-Rolled
A 500 Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
A 501 Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing
A 567/A 567M Specification for Castings, Iron, Cobalt, and Nickel-Base Alloy, for High Strength at Elevated Temperatures
A 569/A 569M Specification for Steel, Carbon (0.15 Maximum, Percent), Hot-Rolled Sheet and Strip Commercial
A 582/A 582M Specification for Free-Machining Stainless Steel Bars
B 221 Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
D 907 Terminology of Adhesives

2.2 National Electrical Manufacturer’s Association:
NEMA LD-3 High Pressure Decorative Laminates

2.3 American Institute of Steel Construction Manual:
AISC Wire and Sheet Metal Gages—Equivalent Thickness in Decimals of an Inch, U.S. Standard Gage (USSG) for Uncoated Hot and Cold Rolled Sheets

3. Terminology
3.1 Definitions of Terms Specific to This Standard:
3.1.1 mess table—a dining table for use in crew, officer, or passenger dining areas, consisting of a horizontal top assembly and one or more supporting pedestals.
3.1.2 table top—the assembled horizontal surface of the mess table including the substrate, top covering, lee rails, and edge binder, or all of the preceding.
3.1.2.1 substrate—the structural core of the top assembly.
3.1.2.2 top covering—the decorative melamine laminate attached to the top surface of the substratae.
3.1.2.3 Lee Rails:
(a) fixed lee rail—a trim piece at the edge of the table top that projects above the upper surface of the table top to retain tableware and act as an edge binder.
(b) adjustable lee rail—a trim piece at the edge of the table top that can be raised above the upper surface of the table top to retain tableware and can be retracted when not needed.
3.1.2.4 edge binder—the finishing strips of metal applied to the edge of the table top.
3.1.2.5 cleanout—an interruption in the raised portion of the lee rail to facilitate cleaning of table top.
3.1.2.6 pedestal—a round or square tubular column, or stanchion, that supports the table top. Each pedestal has a table-support plate at its upper end and provisions at the bottom for attaching to the structural deck.
(a) table support plate—a flanged, dished plate or flat plate with gussets welded to top of pedestal for supporting and attaching to the table top.
3.1.2.7 deck socket—a metal sleeve or adaptor welded to the structural deck, over which the table pedestal is installed and attached.

Copyright © ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States.
4. Classification

4.1 Types:

4.1.1 Type I—Round mess table with single pedestal.
4.1.2 Type II—Square mess table with single pedestal.
4.1.3 Type III—Rectangular mess table.
4.1.3.1 Grade I—Rectangular table with single pedestal.
4.1.3.2 Grade 2—Rectangular table with two pedestals.
4.2 Classes:

4.2.1 Class A—Table with fixed lee rails.
4.2.2 Class B—Table with adjustable lee rails.

5. Ordering Information

5.1 Orders for materials under this specification shall include the following:

5.1.1 Quantity and size of each type, grade, and class.
5.1.2 Paint:
5.1.2.1 Color—The purchaser shall pick from manufacturer's samples or submit a sample chip of color desired.
5.1.2.2 Manufacturer's standard baked enamel will be furnished unless otherwise required and indicated by the purchaser.
5.1.3 Color or pattern of melamine laminate top covering.
5.1.4 If pedestal deck sockets are required, they shall be specified in the ordering document; otherwise, the table manufacturer shall have the option of supplying pedestals without sockets but with 2 in. (51 mm) of scribing for trimming and welding to the deck on the ship.
5.1.5 If the total weight of the table assembly is required, it shall be requested by the purchaser.

6. Materials and Manufacture

6.1 For typical design, see Fig. 1, Fig. 2, and Fig. 3.

6.2 Tops:

6.2.1 Tops shall be steel construction with a decorative melamine laminate top cover. The minimum thickness for the top plate, stiffener, and edge channels shall be 16 USSG (0.0598 in. or 1.50 mm) and made from cold-rolled steel sheet of commercial quality in accordance with Specification A 366/A 366M.

6.2.2 The top cover shall be a high-pressure melamine laminate in accordance with NEMA Specification LD-3 with a maximum thickness of \( \frac{1}{16} \) in. (2 mm) securely bonded to the top plate.

6.2.3 Lee Rails, Fixed and Adjustable, shall be anodized aluminum alloy 6063-T1 in accordance with Specification B 221. Studs for attaching to table top shall be Type 300 stainless steel in accordance with Specification A 582/A 582M.

6.2.4 Edge Binder for Tables with Adjustable Lee Rails, shall be flush with top of table and may be either anodized aluminum alloy 6063-T1 in accordance with Specification B 221 or polished Type 300 stainless steel in accordance with Specification A 240/A 240M, at the option of table manufacturer.

6.2.5 Cleanouts, shall be provided as indicated in Figs. 1-3.

6.3 Pedestals:

6.3.1 Pedestal quantity and sizes shall be as specified in Tables 1-6 as illustrated in Figs. 1-3. Commercially acceptable tolerances as specified in Specifications A 53/A 53M, A 500, or A 501 shall apply to all pedestal dimensions. Pedestals shall be of either welded or seamless construction. The choice of round or square pedestal shall be at the option of the table manufacturer. Round pedestals shall be black steel pipe in accordance with Specification A 53/A 53M. Square pedestals shall be structural-steel tubing in accordance with Specifications A 500 or A 501.

6.3.2 Table Support Plate, may be either a flanged dished plate or a flat plate with gussets. If a flat plate and gussets, it shall be of hot-rolled, commercial-quality steel pickled and oiled in accordance with Specification A 567/A 567M and with a minimum thickness of 7 USSG (0.1793 in. or 5 mm). For dished plate, it shall be cold-rolled steel sheet of commercial quality in accordance with Specification A 366/A 366M and with a minimum thickness of 14 USSG (0.0747 in. or 2 mm).

6.3.3 Pedestals may be attached to the deck by welding or by attaching to deck socket. Unless specified in the ordering document, the method used is at the option of the table manufacturer. If round pedestals and sleeves are used, provisions must be made to ensure that the table will not turn.

6.4 Joining:

6.4.1 Metal Components, shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907.

6.4.2 Joining shall be adequate to prevent racking during manufacture or service.

6.4.3 Spotwelds, shall be spaced approximately 3 in. (76 mm) on centers.

6.4.4 Visible Spotwelds, higher than the general surface of the adjacent metal, shall be ground smooth.

6.4.5 Visible Spotweld Depressions, shall be spot filled and ground flush.

7. Performance Requirements

7.1 Tops for mess tables shall be capable of supporting a load of 400 lb (181 kg) uniformly distributed over an area of 2 ft² (0.12 m²) and placed at any location on the top. Load shall remain on top for a minimum of 3 min, and there shall be no indication of permanent set after removal of load.

8. Dimensions

8.1 For dimensions of tables and pedestals, see Figs. 1-3 and Tables 1-6.

9. Workmanship, Finish, And Appearance

9.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice so as to produce each item suitable for its intended use.

9.2 All exposed burrs, raw, or sharp edges which might be injurious to personnel shall be removed.

9.3 Depressions considered unacceptable for the product’s end use shall be spot filled and sanded flush.

9.4 Finish:

9.4.1 All steel surfaces, unless corrosion resistant or with a corrosion-resistant plating, shall be painted so as to prevent corrosion.
9.4.2 Unless otherwise required by the ordering documents, all normally visible parts of the completed unit shall have the manufacturer’s standard baked-on enamel finish.

9.4.3 Color to be specified in the ordering documents.

10. Inspection and Certification

10.1 The manufacturer shall inspect and certify that the item of furniture complies with the furniture specification and the loading requirements as defined in Section 7.

11. Packaging And Package Marking

11.1 Each item shall be marked in accordance with the purchase order.
11.2 Packaging shall be provided and shall be acceptable to a common carrier.

12. Keywords

12.1 marine furniture; marine mess tables; mess tables; ship dining areas
Note 1—See Notes 1 through 7 under Fig. 1.

Standard Specification for Drawers, Furniture, Marine, Steel

This standard is issued under the fixed designation F 825; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the construction of steel furniture drawers for use where invoked by other marine furniture specifications.

1.2 This specification applies to all furniture drawers, except items requiring progressive drawers.

1.3 Values stated in inch-pound units are to be regarded as the standard. The metric equivalents, given in parentheses, are provided for information only.

2. Referenced Documents

2.1 ASTM Standards:

A 240/A 240M Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels

A 366/A 366M Specification for Commercial Steel (CS) Sheet, Carbon, (0.15 Maximum Percent) Cold-Rolled

A 526/A 526M Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Commercial Quality

D 907 Terminology of Adhesives

2.2 American Institute of Steel Construction Manual:

AISC Wire and Sheet Metal Gages— Equivalent Thickness in Decimals of an Inch, U.S. Standard Gage for Uncoated Hot and Cold Rolled Sheets

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 drawers—storage units in furniture items that have tracks on the sides to allow the drawer to slide open or closed.

3.1.2 tracks—the supporting assembly, attached to the sides of a drawer, that allows a drawer to slide open or closed.

3.1.3 drawer tracks—that portion of the track assembly that is attached to drawer sides.

3.1.4 case track—that portion of the track assembly that is attached to side of supporting furniture (case) item.

4. Ordering Information

4.1 Drawers are included as part of the orders for items of furniture requiring drawers. These orders shall include the following:

4.1.1 Paint:

4.1.1.1 Color—Drawers shall be painted to match the furniture item in which they are installed.

4.1.1.2 Manufacturer’s standard baked enamel will be furnished unless otherwise required and indicated by the purchaser.

4.1.2 Locks, if required, shall be installed where noted in the ordering documents.

5. Materials And Manufacture

5.1 For typical design, see Fig. 1.

5.2 Joining:

5.2.1 Metal Components of Drawers, shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907.

5.2.2 Joining shall be adequate to prevent racking during handling.

5.2.3 Spotwelds, shall be spaced approximately 3 in. (76 mm) on centers.

5.2.4 Visible Spotwelds, on the exterior face of drawer front, higher than the general surface of the metal, shall be ground flush.

5.2.5 Visible Spotweld Depressions, on the exterior face of drawer front, shall be spot filled and sanded flush.

5.3 Drawer Front, body and back a minimum of 20 USSG (0.0359 in. or 0.90 mm) in accordance with Specification A 366/A 366M.

5.4 Drawer Locks, if required, shall be disk tumbler cam locks having 90° rotation with a screw-on or spun-on cap attachment. Cylinders shall be die-cast zinc with exposed surfaces finished in satin nickel-plated US-15 finish.

5.5 Drawers, shall be equipped with a means for stopping the drawer at fully extended position. In this fully extended position, the drawer shall project into the supporting furniture...
unit no more than 6 in. (152 mm) for drawers 20 in. (508 mm) long and over and 5 in. (127 mm) for drawers less than 20 in. (508 mm).

5.6 All drawers shall incorporate a latch or other positive means to prevent drawers opening in heavy seas. Spring, bullet, magnetic, or bayonet-type catches will not be permitted. Furniture drawers shall not open when the furniture unit in which drawer is installed is tilted a maximum of 30° from the vertical with a drawer load of 30 lb (14 kg).

5.7 All drawers shall be furnished with a means for pulling drawers open.

5.8 **Drawer and Case Tracks:**

5.8.1 Each drawer shall have a pair of drawer tracks with one drawer track on each of its sides. The supporting furniture (case) shall incorporate case tracks on each side to support drawer track.

5.8.2 Drawer and case tracks shall be zinc-coated steel in accordance with Specification A 526/A 526M, a minimum of 18 USSG (0.0478 in. or 1.22 mm). They shall be equipped with antifriction devices, such as nylon buttons, on horizontal bearing surfaces to minimize friction.

6. **Performance Requirements**

6.1 **Load Requirement:**

6.1.1 Unless otherwise specified, all drawers 30 in. and below (762 mm and below) in length shall safely support a load of 300 lb (136 kg). The load requirement does not apply to drawers with lengths over 30 in. (over 762 mm).

6.1.2 These loads shall be applied to the front edge of the drawer, with the drawer fully extended to the drawer stop position. Load shall remain on drawer for 3 min.

6.1.3 This test shall not adversely affect the operation of the drawer, and no indication of permanent set shall exist after removal of load. Brinelling, or crushing of replaceable nylon buttons in track assembly, shall not constitute failure under this test.

6.2 **Tilt Test:**

6.2.1 Drawers shall be checked against sliding open in a tilted attitude by randomly placing 30 lb (14 kg) of books in the drawer. The item of furniture shall then be tilted 30° from the vertical and maintained in this position for 3 min. During this time, the drawer must remain closed.

7. **Dimensions**

7.1 Drawers shall be made to a size that suits the furniture item that supports them.

8. **Workmanship, Finish, And Appearance**

8.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice to produce each item suitable for its intended use.

8.2 All exposed burrs, raw, or sharp edges that might be injurious to personnel shall be removed.
8.3 Depressions considered unacceptable for the product’s end use shall be spot filled and sanded smooth.

8.4 Finish:

8.4.1 All steel surfaces, unless corrosion resistant or with a corrosive-resistant plating, shall be painted so as to prevent corrosion.

8.4.2 Unless otherwise required by the furniture specification, all normally visible parts of the completed unit shall have the manufacturer’s standard baked-on enamel finish.

9. Inspection And Certification

9.1 Inspection and certification requirements of the furniture item in which the drawer or drawers is installed shall govern.

10. Packaging And Package Marking

10.1 Each drawer shall be installed in its respective furniture item before shipment. Marking and packaging requirements of the furniture item shall govern.

11. Keywords

11.1 drawers; marine furniture; steel furniture drawers

3. Terminology

3.1 Definitions of Terms Specific to This Standard:
3.1.1 case goods—furniture items having drawers, a cabinet with doors, or both.
3.1.2 edge binder—the strips of metal or other material applied to the edges of a top.
3.1.3 lee rails—extensions above the surface of furniture tops that retain items placed on top.
3.1.4 substrate material—the core, or structural material of the top, to which the melamine laminate is directly bonded.
3.1.5 tops—the horizontal surface that makes up the upper exposed surface of furniture items.

4. Classification

4.1 Tops shall be of the following types as required by the specifications for the item of furniture and as indicated in the ordering documents. See Fig. 1, Fig. 2, Table 1, and Table 2 for details.

4.1.1 Type I—Top on which the edge binder is flush with the top and the substrate material is steel.
4.1.2 Type II—Top on which the edge binder projects above the upper surface of the top to act as a lee rail and the substrate material is steel.
4.1.3 Type III—Top on which a lee rail is applied to the upper surface of the finished top, the top has a self edge securely bonded to the finished top, and the substrate material is a particle or mineral board core.
4.1.4 Type IV—Top is an insert panel and the edge binder is an integral part of the supporting furniture unit.

4.1.4.1 Grade 1—Substrate material and edge reinforcements for Types I, II, and IV Grade 1 tops shall be a minimum of 16 USSG (0.0598-in. or 1.6-mm) steel in accordance with Specification A 366/A 366M.
4.1.4.2 Grade 2—Substrate material is a particle or mineral board core with a minimum density of 45 lb/ft³ (722 kg/m³).

5. Ordering Information

5.1 Tops are included as part of the orders for items of furniture requiring tops. These orders shall include the following information:
5.1.1 Type.
5.1.2 Color or pattern of top covering material, or both.
5.1.3 If Type III top is ordered, whether lee rail is required.

6. Materials and Manufacture

6.1 For typical design, see Fig. 1 and Fig. 2.

6.2 Sheet Metal, shall be cold-rolled steel, commercial quality, furniture grade in accordance with Specification A 366/A 366M.

6.3 Joining:
6.3.1 Metal components shall be joined by welding or gluing with a structural adhesive as defined in Terminology D 907.

6.3.2 Joining shall be adequate to prevent racking during handling.

6.3.3 Spotwelds, shall be spaced approximately 3 in. (76 mm) on centers.

6.3.4 Visible Spotwelds, higher than the general surface of the metal, shall be ground flush.

6.3.5 Spotweld Depressions, shall be spot filled and sanded flush.

6.4 Top Covering for All Type Tops, shall be high-pressure melamine laminate in accordance with ANSI/NEMA LD-3, with a minimum thickness of 0.045 in. (1.1 mm) and a maximum thickness of 0.062 in. (1.6 mm) securely bonded to upper surface of substrate material.

6.5 Completed Top, shall be securely attached to the supporting furniture unit below.

6.6 Type I also has the following requirements:

6.6.1 Substrate, a minimum of 16 USSG (0.0598 in. or 1.50 mm) of steel in accordance with Specification A 366/A 366M.
6.6.2 *Edge Reinforcement*, shall be a minimum of 16 USSG (0.0598 in. or 1.50 mm) of steel in accordance with Specification A 366/A 366M.

6.6.3 For Types I, II, and IV Grade 1 tops, a stiffener shall be applied to any area of the steel substrate having an unsupported width >3½ in. (>89 mm). Stiffener shall be 18 USSG (0.0478 in. or 1.20 mm) in accordance with Specification A 366/A 366M. See Fig. 3 for a definition of this requirement.

6.6.4 *Edge Binder*, for Type I top shall be of Type 6063-TI anodized aluminum extrusion in accordance with Specification B 221 and installed flush with the upper surface of the finished top.

6.6.5 *Back Molding*, shall be an anodized aluminum extruded bar in accordance with Specification B 221, attached to the top with No. 6 oval head stainless steel machine screws.

6.7 Type II also has the following requirements:

6.7.1 Substrate in accordance with 6.6.1.

6.7.2 Edge reinforcement in accordance with 6.6.2.

6.7.3 Substrate stiffener in accordance with 6.6.3.

6.7.4 *Combination Edge Binder and Lee Rail*, shall be of Type 6063-TI anodized aluminum-alloy extrusion in accordance with Specification B 221 and installed so it projects above the upper surface of top a minimum of ¼ in. (6.35 mm) to act as a lee rail.

6.7.5 Back molding in accordance with 6.6.5.

6.8 Type III also has the following requirements:

6.8.1 *Substrate*, shall be particle board core in accordance with ANSI A208.1, or mineral board core, maximum thickness of 1 in. (25.4 mm).

6.8.2 *Self Edge*, of the same material as the melamine top covering shall be securely bound to the top edge. Where tops have radiused edges requiring a postforming grade of the melamine laminate, a black color may be used if a top matching color or pattern in postforming melamine laminate is not available.

6.8.3 *Lee Rail of Polished and Lacquered Brass*, in accordance with Specification B 16/B 16M shall be applied to upper surface of finished top after application of melamine covering and shall project above the upper surface of the top a maximum of ¼ in. (6 mm).

6.8.4 Types III and IV Grade 2 tops shall have a backing sheet securely bonded to the underside of particle board substrate material. The backing sheet shall be a ANSI/NEMA LD-3 Type BK30 or BK40 high-pressure back laminate.

6.9 Type IV, Grade 1 also has the following requirements:

6.9.1 Substrate in accordance with 6.6.1.

6.9.2 Edge reinforcement in accordance with 6.6.2.

6.9.3 Substrate stiffener in accordance with 6.6.3.

6.9.4 The top is an inserted panel and the edge binder is an integral part of the supporting furniture unit. The edge binder, except for rear molding, is 18 USSG steel (0.0478 in. or 1.20 mm) in accordance with Specification A 366/A 366M.

6.9.5 The back molding shall be in accordance with 6.6.5.

6.10 Type IV, Grade 2 also has the following requirements:

6.10.1 *Substrate*, shall be particle board core in accordance with ANSI A208.1 or mineral board core, ½ in. (13 mm) thick.

6.10.2 Binder in accordance with 6.9.4.

6.10.3 Backing sheet in accordance with 6.8.4.

6.10.4 Back molding in accordance with 6.6.5.

6.11 Type IV Grades 1 and 2 tops shall be retained in case with No. 8 hex head jack screws and lock nuts spaced 8 in. (203 mm) on center. The completed top shall be attached securely to the supporting furniture unit below.

7. **Performance Requirements**

7.1 Tops shall be capable of supporting a load of 400 lb (181 kg) uniformly distributed over an area of 2 ft² (0.2 m²) and placed at any location on the top. Load shall remain on top for a minimum of 3 min, and there shall be no indication of permanent set after removal of load.

8. **Dimensions**

8.1 Tops shall be made to a size that suits the furniture item that supports them.

8.2 Lee rails shall not extend above the upper surface of the finished top more than ¼ in. (6 mm).

9. **Workmanship, Finish and Appearance**

9.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice to produce each item suitable for its intended use.

9.2 All exposed burrs, raw, or sharp edges which might be injurious to personnel shall be removed.

9.3 Depressions considered unacceptable for product’s end use shall be spot filled and sanded smooth.

9.4 Plastic laminate shall be well bonded to top substrate and shall have no loose edges.

9.5 All tops shall be flat.

9.6 *Finish*:

9.6.1 All steel surfaces, unless corrosion resistant or with a corrosion-resistant plating, shall be painted so as to prevent corrosion.

9.6.2 Unless otherwise required by the furniture specification, all normally visible parts of completed unit shall have the manufacturer’s standard baked-on enamel finish.

9.6.3 Color and pattern to be specified in the ordering documents.

10. **Inspection And Certification**

10.1 Inspection and certification requirements of the furniture item on which the top is installed shall govern.

11. **Packaging And Package Marking**

11.1 Each top shall be installed in its respective furniture item before shipment. Marking and packaging requirements of furniture item shall govern.

Standard Specification for
Ladders, Fixed, Vertical, Steel, Ship’s

This standard is issued under the fixed designation F 840; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers fabrication details for fixed,
vertical, steel ladders for personnel access on ships.
1.2 Nonferrous ladders and special-purpose ladders are
excluded from this specification.
1.3 The values stated in inch-pound units are to be regarded
as the standard.
1.4 This standard does not purport to address all of the
safety concerns, if any, associated with its use. It is the
responsibility of the user of this standard to establish appro-
priate safety and health practices and determine the applica-
bility of regulatory limitations prior to use.

2. Referenced Documents

A 36/A36M Specification for Carbon Structural Steel
2.2 American Bureau of Shipping, Rules for Building and
Classing Steel Vessels: 3
Section 43.3 Ordinary Strength Hull Structural Steel
Section 30 Welding
2.3 American Welding Society Standard: 4
AWS D 1.1—Structural Welding Code
2.4 Federal Standard: 5
TT-P-645 Primer, Paint, Zinc Chromate, Alkyd Type

3. Definition of Terms Specific to This Standard

3.1 fixed ladder—a ladder permanently attached by welding
or bolting to ship’s structure or equipment.
3.2 pitch—the included angle between the horizontal and
the ladder, measured on the opposite of the ladder from the
climbing side.
3.3 vertical ladder—a ladder which has an installed pitch
range from 75 to 90° (vertical).

4. Classification

4.1 Ladders are furnished in three types as follows:
4.1.1 Type I—Normal duty (Fig. 1).
4.1.2 Type II—Punched stringers (Fig. 2) as an alternate to
Type I.
4.1.3 Type III—Heavy duty (Fig. 3). This type may be
specified in cargo holds where the cargo or equipment or
vehicles used to handle cargo could be expected to damage a
Type I or Type II ladder.

5. Ordering Information

5.1 Orders for material under this specification shall include
the following:
5.1.1 Quantity,
5.1.2 Type (4.1), and applicable detail in Fig. 2,
5.1.3 Material (6.1),
5.1.4 Finish (8.2),
5.1.5 Dimensions a and b and L (Fig. 1, Fig. 2, or Fig. 3),
5.1.6 Number of rungs,
5.1.7 Welding specification (6.2),
5.1.8 Marking (Section 10), and
5.1.9 ASTM designation and date of issue.

6. Materials and Manufacture

6.1 Unless otherwise specified in ordering documents, steel
shall conform to the requirements of Specification A 36/
A 36M, ABS Section 43.3, or equal.
6.2 Unless otherwise specified in ordering documents,
welding shall conform to AWS D 1.1 or ABS Section 30.

7. Dimensions

7.1 The dimensions shall be in accordance with Figs. 1-3.
7.2 Dimensions are given in inches with metric conversion
in parentheses.

8. Workmanship, Finish, and Appearance

8.1 Ladders shall be free of splinters, sharp edges, burrs, and
weld spatters.
8.2 Finish—Unless otherwise specified in ordering docu-
ments, ladders shall, after fabrication, be sand or shot blasted
to remove rust and scale and given a complete coat of zinc
chromate primer, Federal Specification TT-P-645.
9. Inspection

9.1 Unless otherwise specified in ordering documents, all ladders shall be visually inspected for workmanship, finish, and appearance as defined in Section 8.

10. Marking

10.1 Unless otherwise specified in ordering documents, each ladder shall be marked with purchase-order number, item number (from purchase order), ASTM designation number, and manufacturer’s name. Marking may be by steel stamp, paint stencil, or weatherproof tag.

Standard Specification for Thrusters, Tunnel, Permanently Installed in Marine Vessels

This standard is issued under the fixed designation F 841; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification supplies general characteristics and interface details of propeller type, fixed-tunnel thruster units permanently installed in marine vessels or structures.

1.2 Values stated in either inch-pound units or SI (metric) units are to be regarded separately as standard. The values stated in each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

NOTE 1—This specification supplies only general design, interface, and purchase information and does not include requirements for use, thruster controls, or associated equipment. The purchaser of the thruster equipment specified herein is cautioned that he must properly correlate the operating requirements with the thruster specified.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:

2.2 American Bureau of Shipping:
ABS Rules for Building and Classing Steel Vessels
2.3 ISO Document:
ISO Recommendation ISO/DIS 484/11 (Draft)

3. Definitions of Terms Specific to This Standard

3.1 thruster—a device constructed such as to provide a force or thrust of controlled variable magnitude and direction to a marine vessel or structure, usually, but not limited to, a propeller mounted within a tunnel located below water level.

3.2 fixed pitch—(FP) a propeller in which the blades are part of, or are rigidly attached to, the hub such that the propeller pitch is constant for a given radius.

3.3 controllable pitch—(CP) a propeller in which the blades are attached to a mechanism within the hub by means of bolts or fasteners, so that controlled movement of the mechanism causes the blades to change pitch in unison.

3.4 tunnel—a part of thruster assembly of circular cross section which houses structure supporting a propeller and drive mechanism.

3.5 peak power—highest horsepower developed by the prime mover, or as limited by the thruster manufacturer.

3.6 continuous duty—operation of the thruster continuously at any power range, up to manufacturer’s rating, for extended periods, but not to overlap into recommended maintenance intervals.

3.7 intermittent duty—operation of the thruster at peak power or RPM levels, or both, for periods not exceeding 1 h followed by periods of 1 h at the continuous rating or less, with total running time not exceeding 8 h in 24 h.

3.8 landing bars—permanent attachments, usually in the form of plates welded to the tunnel during manufacture, intended to provide joining facilities for deck plates or bulkheads, or both, at installation. Landing bars are neither intended to be part of the support structure for the thruster, nor provide support or transmit forces from the vessel structure to the thruster.

3.9 prime mover—the motor(s) or engine(s) providing the power to drive the thruster.

3.10 grid bars—bars installed at the tunnel entrances in the form of a mesh to prevent large objects from passing through the thruster tunnel. The area occupied by the grid bars shall not exceed 6% of the tunnel cross-sectional area.
4. Classification

4.1 Thrusters manufactured in accordance with this specification shall be identified as follows:
4.1.1 Type I—Fixed pitch.
4.1.2 Type II—Controllable pitch.
4.2 Each type of thruster may be manufactured to the following grade:
4.2.1 Grade 1—Intermittent duty for docking and navigation.
4.2.2 Grade 2—Continuous duty for stationkeeping or dynamic positioning.

5. Ordering Information

5.1 Requests for quotation and purchase orders shall specify the following (in absence of specific requirements in ordering data, the unit will be provided only as specified herein):
5.1.1 Description of thruster.
5.1.2 ASTM designation and date of issue.
5.1.3 Type.
5.1.4 Grade.
5.1.5 Input Shaft Angle—Refer to Fig. 1.
5.1.6 Tunnel Extensions—Refer to Fig. 2.

Note 1—The thruster will be supplied without the blade hatch unless otherwise specified in the ordering data.

FIG. 1 Input Shaft Angle
5.1.7 Landing bars or other weldments to the thruster to be shown in a sketch or drawing provided by the purchaser.

5.1.8 Type of prime mover.

5.1.9 Input HP and RPM to thruster.

5.1.10 Material Options for Hub and Blades:
5.1.10.1 Ni-Al Bronze ABS Type 4.
5.1.10.2 Stainless steel Specification A 296 – 72 GR CF-3 or CF-8C or other ABS approved material.
5.1.10.3 Manganese bronze ABS Type 2.

5.1.11 Blade hatch.

5.1.12 Instruction books (unless otherwise specified, six copies in English).

5.1.13 Tunnel insert (erosion liner).

5.1.14 Painting or coating, external (water contact surfaces).

5.1.15 Painting or coating, internal (inside hull).

5.1.17 Special tools.

5.1.18 Spare parts.

5.2 As a minimum, the following vessel particulars shall be furnished when the thruster manufacturer is required to determine the thruster size; other particulars may be required by the thruster manufacturer.

5.2.1 Vessel type.

5.2.2 Applicable classification society.

5.2.3 Length at waterline.\(^6\)

5.2.4 Width at waterline.\(^6\)

5.2.5 Draft, loaded forward after or draft, ballast forward after.

5.2.6 Dimension of keel to thruster centerline.

5.2.7 Dimension of bow at waterline to thruster centerline.

5.2.8 Beam at the thruster centerline.

5.2.9 Vessel displacement.\(^6\)

5.2.10 Vessel service and operating environment.

5.2.11 Whether grid bars are to be installed.

6. Materials and Manufacture

6.1 General Requirements—The tunnel shall be made of tested steel of ABS quality or equal, fabricated, cast or forged, or a combination thereof. All structural welding shall be in accordance with the applicable regulatory agency or the thruster manufacturer’s recommendations or both. All welds exposed to (sea) water shall be overlayed with weld metal containing 2½ % nickel, minimum. The minimum tunnel

\(^6\) With reference to fully loaded design conditions.
material thickness shall meet applicable classification society requirements. A replaceable insert may be provided in the tunnel in way of the propeller tips to prevent erosion of the tunnel wall (Fig. 3). The minimum width of the insert shall be 10% of the propeller diameter. If an insert is not used, the tunnel thickness in way of the blades, and for a minimum length of 10% of the tunnel diameter, shall be increased by at least 10% of the required thickness. Reinforcement rings/stiffeners may be applied at each end of the tunnel by the manufacturer. The rings may or may not become part of the joint detail to the tunnel extension.

6.2 Propeller blades and hub may be one of the following materials or other material approved by the applicable classification society and shall be specified in the ordering data.

6.2.1 Ni-Al Bronze ABS Type 4.
6.2.2 Stainless Steel Specification A 296 – 77 GR CF-3 or CF-8C.
6.2.3 Manganese Bronze ABS Type 2.

6.3 All fasteners exposed to (sea) water shall be of monel, stainless-steel, or bronze alloy, unless otherwise specified in the ordering data.

6.4 All materials shall be free of imperfections and defects that adversely affect serviceability.

6.5 All steel surfaces exposed to (sea) water shall be cleaned, painted, or coated in accordance with manufacturer’s commercial practice or as otherwise specified in ordering data.

6.6 All steel surfaces that will be within the hull of the vessel shall be cleaned, painted, or coated in accordance with manufacturer’s commercial practice or as otherwise specified in ordering data.

6.7 The thruster shall consist of a propeller mounted within a strongly fabricated circular tunnel. The propeller will be secured to a shaft that is rigidly supported in oil lubricated antifriction bearings.

6.7.1 A thrust bearing shall be contained within a housing that is securely attached to the tunnel section such as to transmit the thrust developed by the propeller.

6.7.2 A drive mechanism shall be provided to transmit power to the propeller. This also shall be within the housing and be oil lubricated.

6.7.3 The right-angle drive shafting and propeller hub shall be removable, if necessary, for inspection or repair without removing the tunnel from the vessel.

6.7.4 The propeller shall be statistically balanced as specified in the ordering data.

6.7.5 For Type 2 controllable pitch thrusters, the tunnel may be equipped with a removable hatch over the propeller to permit withdrawal of blades. This requirement shall be specified in the ordering data.

6.8 The tunnel shall be attached to the ship’s structure by means of tubular extensions that are part of or are welded to the ends of the tunnel. No other welding on the assembled unit is permitted without the manufacturer’s approval in view of possible damage to the alignment of drive mechanism and bearings. Should other weldments, for example, landing bars, be required, they shall be specified by the purchaser before the tunnel manufacture.

6.9 A lubrication system shall be provided for bearings and gears. Seals shall be provided to prevent leakage of oil out of the thruster and ingress of (sea) water into the thruster. A pressure shall be maintained within the thruster that is at least 1 psig (7 kPa) greater than the outside water pressure measured at the thruster centerline.

7. Other Requirements

7.1 Propeller Design (General), shall be based on standard series model tests carried out at a recognized marine laboratory or by substantiated test data from previous application.

7.2 The thruster manufacturer shall submit, as a minimum, the following plans for review by the purchaser.

7.2.1 Installation drawing.
7.2.2 Outline drawings of major assemblies showing overall dimensions, interface details, and weights.

7.3 It is recommended that an hour meter be installed in the system such that preventive maintenance and records of operation may be maintained.

7.4 One Set of Special Tools, as deemed necessary by the manufacturer, for removing the propeller hub and blades, shafting and right-angle drive parts shall be provided unless otherwise stated in the ordering data.

Legend:

\( T \) = Minimum tunnel material thickness to meet applicable classification society requirements

\( D \) = Tunnel diameter (inside)

\( P \) = Propeller diameter

\( S \) = Tunnel insert (erosion liner) thickness

\( \frac{3}{16} \) in. (5 mm) minimum for \( D \leq 60 \) in. (1.52 m)

\( \frac{1}{4} \) in. (6 mm) minimum for \( D > 60 \) in. (1.52 m)

FIG. 3 Tunnel Insert (Erosion Liner) or Alternative Method
7.5 One Set of Normal Onboard Spare Parts, as recommended by the manufacturer for one year’s service shall be provided unless otherwise stated in the ordering data.

7.6 Copies of instruction books of standard commercial format shall be provided, as required by the ordering data. Instruction books shall describe the installation, startup, operation, planned maintenance, troubleshooting, assembly, and disassembly of the manufacturer’s equipment.

8. Dimensions and Ratings

8.1 Interface dimensions of thrusters shall be provided by the vendor and shall include at least the dimensions defined in Fig. 2 and Fig. 1.

8.2 At its normal continuous rating, the thruster shall be capable of producing a minimum thrust of 23 lb/hp (0.137 N/W). The input horsepower per square foot (propeller disk area) shall not exceed 50, for example, horsepower per area shall be \( \pm 50 \) (401.5 kW/m²). Propeller tip speed shall not exceed 6300 ft/min (1920 m/min).

8.3 The nominal thrust of 23 lb/hp (0.137 N/W) does not take into account losses for added tunnel length, bends, or grid bars and assumes a minimum submergence of one propeller diameter to the thruster centerline.

9. Workmanship

9.1 All workmanship shall be workmanlike and of acceptable commercial marine standard in all respects, and all materials, machinery, pieces, or parts specified shall be of recent manufacture and unused except for normal testing as required.

10. Inspection and Shop Testing

10.1 The manufacturer shall test the thruster unit to ensure proper assembly, alignment, and functioning of the internal mechanisms.

10.2 The manufacturer shall inform the purchaser at least ten days before testing such that the testing may be witnessed should the purchaser so desire.

10.3 During manufacture of the thruster, inspection records shall be made of at least the following:

10.3.1 Backlash, alignment, and pattern of gear (if used).

10.3.2 Blade tip clearances, each blade at eight equally spaced intervals.

10.3.3 For units with detachable blades, the blade weight and balance.

10.3.4 Mounting and clearance dimensions.

10.4 Final test and inspection shall include at least the following:

10.4.1 FP Units:

10.4.1.1 Spin test in air of sufficient duration to verify satisfactory operation,

10.4.1.2 Oil temperature before and during spin test, and

10.4.1.3 Visual inspection for leaks before and after spin test.

10.4.2 CP Units:

10.4.2.1 Spin test in air of sufficient duration to verify satisfactory operation,

10.4.2.2 Oil pressures and temperature before and during spin test,

10.4.2.3 Pitch changing pressures (or force if mechanical) (both directions),

10.4.2.4 Pitch changing-time full stroke, and

10.4.2.5 Visual inspection for leaks before and after spin test at relief-valve pressure operation for a period of 2 min.

10.5 Nonrotational tests shall include at least the following for CP thrusters.

10.5.1 Pitch changing time (full pitch to full pitch, both directions).

10.5.2 Minimum pitch changing pressure or force, both directions.

10.5.3 Visual leak inspection at relief-valve pressure operation for a period of 2 min.

10.5.4 Pressures during pitch cycling.

10.6 The recorded data shall be issued and become part of the instruction manual.

11. Product Marking

11.1 The thruster unit assembly shall include at least the following:

11.1.1 Manufacturer’s name,

11.1.2 Model number,

11.1.3 Serial number,

11.1.4 ASTM specification number, and

11.1.5 Date of manufacture.

12.1 fixed-tunnel thrusters; propeller-type thrusters
Standard Practice for
Mechanical Symbols, Shipboard—Heating, Ventilation, and Air Conditioning (HVAC)\(^1\)

This standard is issued under the fixed designation F 856; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (\(\epsilon\)) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This practice covers symbols used on heating, ventilation, and air conditioning (HVAC) detailed engineering drawings.

1.2 These symbols may be useful on contract and preliminary design drawings.

2. Significance and Use

2.1 When symbolic representation is required for an item not covered in this standard, the character of the symbol shall be adequately identified and shall be subject to one interpretation only. If necessary, a note shall be attached to the symbol for further clarity.

2.2 Symbolic representation does not require exact or scale layouts of the actual system. Therefore, the symbols may be used in all views of the system layout.

3. Abbreviations

3.1 The abbreviations (for use only in this practice) are defined as follows:
- AF = axial fan,
- AFD = automatic fire damper with manual override,
- BD = balance damper,
- CC = cooling coil,
- CCW = counter clockwise,
- CE = convection heater, electric,
- CF = centrifugal fan,
- CS = convection heater, steam,
- CW = clockwise,
- EH = turret heater electric,
- EP = duct preheater, electric,
- ER = duct re heater, electric,
- EU = electric unit heater,
- F = filter,
- FA = flame arrester,
- FCA = fan coil assembly,
- FCU = fan coil unit,
- G = grille,
- GC = gravity cooling coil,
- H = humidistat, humidifier,
- L = louver,
- M = motor,
- MFD = manual fire damper,
- NE = natural exhaust,
- NS = natural supply,
- R = return air,
- RO = remote operated,
- SFD = solenoid fire damper,
- SP = preheater, steam,
- SR = re heater, steam,
- SU = steam unit heater,
- T = thermostat,
- TE = tempered air, electric,
- TS = tempered air, steam,
- U = undercut,
- UC = unit cooler,
- V = volume, volumetric, and
- VC = volume control.

4. Illustrations

4.1 Illustrations for HVAC symbols are given in Figs. 1-4.

5. Keywords

5.1 air conditioning; design symbols; engineering symbols; heating; HVAC; marine; ship; symbols; ventilation

\(^1\) This practice is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

**Note 1**—"Class A" is in reference to bulkhead classification as described in the Code of Federal Regulations, Title 46, Section 92.07-5. (Available from Superintendent of Documents, U. S. Government Printing Office, Washington, DC 20402.)

Standard Specification for Envelope Dimensions for Bronze Globe Valves NPS \( \frac{1}{4} \) to 2

This standard is issued under the fixed designation F 885; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (\( \varepsilon \)) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides standard dimensions for small bronze globe valves (NPS \( \frac{1}{4} \) to 2) installed in shipboard piping systems.

1.2 This specification covers valves of a nominal pipe size from NPS \( \frac{1}{4} \) to 2 with threaded and brazed end connections. The valves are in accordance with MSS-SP80, Class 200.

2. Referenced Documents

2.1 ASTM Standards:
   B2.1 Pipe Threads (Except Dryseal)\(^2\)

2.2 Manufacturer’s Standardization Society of the Valve and Fittings Industry Standard:
   SP80 Bronze Gate, Globe, Angle and Check Valves\(^3\)

3. Materials and Manufacture

3.1 Threaded end connections shall be in accordance with ANSI B2.1. Brazed end connections shall be in accordance with Table 1.

<table>
<thead>
<tr>
<th>Valve Size – NPS</th>
<th>Depth of Socket, in. (mm)</th>

<td></td>
</tr>
</tbody>
</table>

4. Dimensions

4.1 Valve dimensions for both threaded- and brazed-type end connections are provided in Fig. 1.

5. Tolerances

5.1 A plus or minus tolerance of \( \frac{1}{32} \) in. (0.8 mm) shall be allowed on all dimensions that do not have a maximum or minimum specified.

6. Keywords

6.1 brazed connection; bronze globe valve; envelope dimension; globe valve; marine technology; ship
SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the inquiry, contract, or order.4

4 The Supplementary Requirements shall be deleted two years from the approved date of the current edition of this specification.

S1. Permissible Variations

S1.1 The permissible variations in Dimension A of Fig. 1 are shown in Table S1.1. The permissible variations in the centerline to end dimensions for angle valves shall be one half the values specified in Table S1.1. The tolerance specified in 5.1 may be added to or deducted from Dimension ‘A’ after the permissible variation is applied.

Standard Specification for
Letters and Numerals for Ships

This standard is issued under the fixed designation F 906; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification specifies shape, size, spacing, and
shading of letters and numerals to be used aboard ship.

1.2 Characters are of Five Types:

1.2.1 Type 1—Plain letters and numerals (16 units).
1.2.2 Type 2—Block letters and numerals (12 units).
1.2.3 Type 3—Type 2 characters with shading (shading—1
unit).
1.2.4 Type 4—Block letters (10 units) and numerals (12
units).
1.2.5 Type 5—Type 4 characters with shading (shading—1
unit).

1.3 This specification does not give location or size of
various shipboard markings incorporating letters and numerals.

2. Ordering Information

2.1 When ordering letters and numerals in accordance with
this specification, it is necessary to state the ASTM designation
and the type and height of the character.

3. General Requirements

3.1 Characters are designed using the grid method which
allows the size of the character to be changed proportionately
as required.

3.1.1 Character Stroke (thickness—2 units).
3.1.2 Character Width:
3.1.2.1 Type 1, Plain Characters—12 in accordance with
Fig. 1 unless otherwise noted.
3.1.2.2 Type 2, Block Characters—8 units in accordance
with Fig. 2 unless otherwise noted.
3.1.2.3 Type 3, Block Characters with Shading—same as
Type 2 plus 1 unit for shading in accordance with Fig. 3.
3.1.2.4 Type 4, Block Characters, Letters—width varies.
Numerals—8 units.
3.1.2.5 Type 5, Block Characters with Shading—same as
Type 4 plus 1 unit for shading.

3.2 Sizing of the Character:
3.2.1 Type 1—space characters in accordance with Table 1.
3.2.2 Type 2—space characters in accordance with Table 1.
3.2.3 Type 3—space characters in accordance with Table 1
with 1 unit added to each value for shading.
3.2.4 Type 4—space letters in accordance with Fig. 4;
spacing shall be equal to the space following the letter.
Numerals shall be spaced in accordance with Table 1.
3.2.5 Type 5—space letters in accordance with Fig. 5;
spacing shall be equal to the space following the letter.
Numerals shall be spaced in accordance with Table 1 with 1
unit added to each value for shading.

3.3 Spacing Between Words, After Punctuation, or Between
Sentences:
3.3.1 The space between words, after a comma, and after a
period (as after initials) shall be in accordance with Table 1.
3.3.2 The space between sentences shall be in accordance
with Table 1.
3.3.3 The space between a letter and a comma or period (for
any use) shall be 2 units.
3.3.4 The space between lines shall be equal to one half the
height of the tallest letter.

4. Keywords

4.1 block characters; block letters; block numerals; letters;
marine; numerals; plain letters; plain numerals; shading; ship;
ship letters; ship markings; ship numerals

**Key:**
- *—means space for: B.D.E,F,H.I,K,L,M,N,P.R.U 1,3,8 (also used for punctuation and sentence spacing).
- +—means space for: C.G.O.Q.S 0,2,5,6,9.
- Δ—indicates that a portion of a letter enters the area of the next letter.

**Character Spacing:**
Select a character from the vertical column, read across locating the next character, read up to find the correct spacing.

**Example:**
If the letter “K” is followed by the letter “A” the spacing is 1 unit.
If the letter “F” is followed by the letter “H” the spacing is 2 units.

**Punctuation and Sentence Spacing:**
Locate in column of table the last character of word, read across locating (*), drop vertically down to the appropriate row and read spacing.

**Example:**
If the first word was “vessel,” the spacing to the first letter of the next word is 12[1/2]P units.
FIG. 1 Type 1—Plain Letters and Numerals

FIG. 2 Type 2—Block Letters and Numerals

Note—Height: Letters—16 Units
Numerals—16 Units

Note—Height: Letters—12 Units
Numerals—12 Units
FIG. 3  Type 3—Type 2 Characters with Shading

Note—Shading 1 Unit Wide

FIG. 4  Type 4—Block Letters and Numerals

Note—Height: Letters—10 Units
      Numerals—12 Units
FIG. 5 Type 5—Type 4 Characters with Shading

Note—Shading 1 Unit Wide.
Standard Practice for Quality Control Receipt Inspection Procedures for Protective Coatings (Paint), Used in Marine Construction and Shipbuilding

1. Scope

1.1 This practice provides the quality control receipt inspection procedures for protective coatings (paints) procured for end item use on ships and other marine structures. The practice includes methods and procedures for verifying that coating materials received are within the range of physical and chemical characteristics as those originally specified and tested.

1.2 This standard does not purport to address the safety problems associated with its use. It is the responsibility of the user of this standard to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
D 185 Test Methods for Coarse Particles in Pigments, Pastes, and Paints
D 523 Test Method for Specular Gloss
D 562 Test Method for Consistency of Paints Using the Stormer Viscometer
D 1200 Test Method for Viscosity by Ford Viscosity Cup
D 1210 Test Method for Fineness of Dispersion of Pigment-Vehicle Systems
D 1308 Test Method for Effect of Household Chemicals on Clear and Pigmented Organic Finishes
D 1309 Test Method for Settling Properties of Traffic Paints During Accelerated Storage
D 1475 Test Method for Density of Paint, Varnish, Lacquer, and Related Products
D 1640 Test Methods for Drying, Curing, or Film Formation of Organic Coatings at Room Temperature
D 1729 Practice for Visual Evaluation of Color Differences of Opaque Materials
D 2196 Test Methods for Rheological Properties of Non-Newtonian Materials by Rotational (Brookfield) Viscometer
D 2244 Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates
D 2369 Test Method for Volatile Content of Coatings
D 2671 Test Method for Infrared Identification of Vehicle Solids From Solvent-Reducible Paints
D 2697 Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings
D 2698 Test Method for Determination of the Pigment Content of Solvent-Reducible Paints by High-Speed Centrifuging
D 2805 Test Method for Hiding Power of Paints by Reflectometry
D 2832 Guide for Determining Volatile and Nonvolatile Content of Paint and Related Coatings
D 3278 Test Methods for Flash Point of Liquids by Setaflsh Closed-Cup Apparatus
D 3925 Practice for Sampling Liquid Paints and Related Pigmented Coatings

3. Terminology

3.1 Batch—a manufacturing run. The industrial unit or quantity of production made in one complete operation. The volume or mass that constitutes a batch is flexible and varies with the size of the plant and its facilities for converting the raw materials into the finished product.

4. Summary of Practice

4.1 Test requirements for identifying characteristics (physical and chemical) of marine coatings are established. Receipt inspection tests are provided to assure that procured paints do not differ significantly from the paints initially evaluated.
5. Significance and Use

5.1 This practice provides a means of assuring that products supplied during ship construction and maintenance are substantially the same as the materials on which the original selection was based. The selection of a paint for shipboard use frequently involves laboratory and field evaluations of candidate materials as part of the specification process. When a paint is selected, it shall have the same composition and characteristics throughout the delivery period as the materials originally evaluated.

5.1.1 When significant changes in composition or paint characteristics are observed, it is necessary to determine the cause of the change (production error or formulation change) and its impact on coating performance. Actions to take if a formulation change is required are specified in 6.5.

5.2 This practice is not meant to cover all possible chemical or physical tests that may be used to identify a coating. Additional tests may be needed to meet specific user needs.

5.3 This practice does not recommend specific tolerance limits for the tests indicated. Tolerance values need to be agreed upon by the coating supplier, the shipbuilder, and the ship’s owner.

5.4 This practice does not establish critical attributes that must be controlled. These attributes are selected by the shipbuilder and the ship’s owner based on specific needs (for example, colors).

6. Procedures

6.1 At the beginning of each contract, after protective coatings selection, the selected material supplier(s) furnish the values for each property listed in Table 1 for each paint selected. This data shall include accept/reject tolerances. These tolerances shall then be reviewed and approved by the shipbuilder.

NOTE 1—Other properties may be specified by the shipbuilder if deemed important due to the special service requirements of the coatings.

6.2 The shipbuilder may retain a sample of each batch of paint received from the paint supplier (minimum sample size of one pint). This retained sample shall be stored for future reference formula verification.

6.3 Each batch of protective coatings (paint) received under the contract shall, as a minimum, be sampled and tested in accordance with the procedures listed in Table 2.

6.4 The data collected on each batch of material tested in accordance with 6.3 shall then be compared to the base line data established in accordance with 6.1. Any variance not within the approved tolerances shall be cause for rejection of the material. If the material complies with 6.3 but is considered suspect, the additional tests listed in Table 1 shall be performed. Any variance not within the approved tolerances shall also be grounds for rejection.

6.5 Once the material selection has been made against a proprietary formulation, the formulation shall not be changed unless approved by the coating supplier, shipbuilder and owner. If approved, the data furnished in 6.1 shall be updated by the paint material supplier.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified in the contract or order.

**S1. Quality Assurance**

S1.1 Commercial usage quality assurance testing shall consist of the minimum designated tests of Table 1 and Table 2. Test requirements not covered by these tables shall be agreed upon by the shipbuilder and the shipowner.

S1.2 When specified in the contract or order, Table S1.1 shall be substituted for Table 1 in 6.1 and Table S1.2 shall be substituted for Table 2 in 6.3.

S1.3 Quality assurance for paints procured for use on Navy ships shall include all applicable tests of Table S1.1 and Table S1.2.

S1.4 Both commercial and Navy usage may require tests in addition to those specified in Table 1, Table 2, Table S1.1, and Table S1.2. Typically, these tests will be required for special service conditions. Such test requirements, and the specific test procedures must be specified in the contract or purchase order.

### TABLE S1.1 Initial Baseline Paint Tests

**NOTE**—Test Methods D 562, D 1200, and D 2196 can be used for consistency measurements. Unless otherwise specified, any one of these three test methods may be used.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Practice for
Inspection of Marine Surface Preparation and Coating Application

This standard is issued under the fixed designation F 941; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice is intended to serve as a guide for determining specific inspection requirements for marine surface preparation and coating application during new construction, major retrofit, or routine maintenance contracts.

1.2 It is intended that this practice be used to coordinate inspection activities between ship owner, ship builder, coatings manufacturer and coatings applicator, and that specific requirements be developed before the commencement of surface preparation or coating application, or both.

1.3 This practice does not provide a means of recording required data (for example, film thicknesses, temperatures, relative humidity, etc.), but instead establishes a format for deciding what data must be recorded, when during the preparation/coating process, and by whom.

1.4 This practice does not establish accept/reject criteria for surface preparation or coating inspection, nor does it address methods of repairing deficiencies found. It does, however, provide a means of determining them.

1.5 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2.5 ASTM Adjuncts:
- Sample Form for Determining Marine Surface Preparation and Coating Application Inspection Practices (F 941)\(^7\)

3. Significance and Use

3.1 This practice may be invoked by any of the parties mentioned in 1.2 and may be included as part of a specification or used to clarify or reinforce an existing specification that does not adequately address inspection. When invoked by the ship owner on the shipbuilder, the shipbuilder is responsible for the coordination effort.

3.2 As surface preparation and coating requirements generally differ from ship area to ship area, this practice shall be applied separately to those areas of similar requirements.

3.3 The contents of this practice shall be addressed (for each applicable ship area) at a prestartup meeting attended by the parties mentioned in 1.2.

4. Procedures

4.1 At the beginning of each new contract, after final protective coatings selection, but well before the start of any surface preparation or coating application, a meeting shall be held between those parties mentioned in 1.2. The Sample Form for Determining Marine Surface Preparation and Coating Application Inspection Practices\(^7\) shall be completed (for each separate ship area) by the responsible party prior to and each item discussed and agreed upon during the meeting. The selected coating supplier(s) shall make available at this time specific product data sheets in accordance with Standard F 718 harmonizing with the design intent of the application for each coating specified.

4.2 After completion of the sample form,\(^7\) and required documentation has been submitted by the coatings supplier(s), signatures of applicable parties shall be obtained and dated.

4.3 A means of collecting and recording the information required by the sample form\(^7\) shall be developed (see 5.1.6.4).

5. Report

5.1 The following paragraphs coincide with the individual sections of the sample form\(^7\) to aid in their proper completion. Guide D 3276 shall be consulted for additional guidance on general surface preparation and coating inspection practices.

5.1.1 Contract—Indicate name of vessel, present owner/agent, and type of vessel (for example, roll-on/roll-off, tanker, etc.).

5.1.2 Category—Indicate whether contract is a new construction, major retrofit, or routine maintenance contract.

5.1.3 Ship Area(s) Concerned—Indicate the ship area(s) (for example, underwater hull, ballast tanks, etc.) that are being addressed in the inspection practice. Where appropriate, frame numbers or ship levels, or both, shall be included.

5.1.4 Surface Preparation Requirements:

5.1.4.1 Surface Preparation, Initial—Indicate the standard(s) that will be used to govern the initial surface preparation process, for the particular ship area(s) under consideration. Both written and visual standards shall be used (ISO, JSRA, NACE, or SSPC as appropriate).\(^8\)

5.1.4.2 Surface Preparation, Touch-Up—Indicate the surface preparation that will be used for repair of small areas of coating damage or areas, or both, left free of coatings (for example, erection butts) during construction.

5.1.4.3 Abrasive—As a minimum, indicate the type and size of the abrasive that will be used to perform the surface preparation process. Any other data (minimum hardness, moisture content, salt content as per Test Method D 4940, etc.) considered pertinent shall also be considered.

5.1.4.4 Surface Profile—Indicate any requirements for surface profile (after preparation), and the method that will be used to perform the measurements.

5.1.4.5 Surface Imperfections—Specific requirements for repair or removal of surface imperfections, or both, if not adequately addressed or defined in the applicable surface preparation standard, shall be included in this section. These imperfections include weld spatter, weld porosities, laminations, sharp edges, and pits.

\(^{7}\) A Sample Form for Determining Marine Surface Preparation and Coating Application Inspection Practices is available at a nominal cost from ASTM Headquarters. Order ADHJ0941.

\(^{8}\) SNAME Bulletin 4-9, available from The Society of Naval Architects and Marine Engineers, 601 Pavonia Ave., Jersey City, NJ 07306, may also be used as an additional reference. This document shall be used as a guide only and is not to be used as a standard.
5.1.4.6 Cleaning Between Coats—Indicate allowable methods for removal of contaminants from the surface of the primer or intermediate coats before overcoating.

5.1.5 Coating Requirements:

5.1.5.1 Specification, Initial—Indicate the complete coating system specified to be applied to the ship area(s) under consideration. Include the manufacturer’s name, product designation or specification number, required color, and required dry film thickness per coat.

5.1.5.2 Specification, Touch-Up—Indicate the coating system (if different from the initial system) that will be used to repair areas of coating damage or areas left uncoated, or both, during construction. Include the manufacturer’s name, product designation or specification number, required color, and dry film thickness per coat.

5.1.5.3 Application Parameters—Standard F 718 product data sheet shall be completed by the coatings manufacturer for each product specified; these data sheets shall be used to establish specific parameters such as minimum/maximum application temperatures and recoat times, mixing procedures, measurement of wet/dry film thickness, etc. Completed data sheets shall be attached to the applicable inspection practice before obtaining approval signatures. The manufacturers’ Material Safety Data Sheets shall be obtained for each product and similarly attached.

5.1.5.4 Stripe Coats—Indicate where stripe coats are required, when applied, what coating should be used, and the allowable method(s) of application.

5.1.6 Inspections:

5.1.6.1 Timing and Frequency—Indicate when inspections will occur during the surface preparation and coating application processes, and their frequency (per unit surface area).

5.1.6.2 Responsibilities—Indicate all persons (name, employer, position, telephone number) that must be present at the time of inspection, and a procedure to follow in the event of their absence or delay.

5.1.6.3 Notification Procedure—Develop a procedure which establishes a specific method for notifying all responsible parties that a ship area is ready for inspection.

5.1.6.4 Record Keeping—Indicate what will be recorded at each inspection, who will accomplish the recording, how the information will be recorded, and to whom copies should be sent. A form shall be developed to aid in this recording process. Space shall be provided for approval or disapproval of the surface preparation or coating application, for noting exceptions found and correction of discrepancies, and for final “sign off” of the completed ship area under consideration.

5.1.7 Sequencing of Work—Indicate the general order of accomplishment of the specified surface preparation and coating work, and any additional information that might aid in assuring a smooth flow of this work.

5.1.8 Approvals—Signatures shall be obtained from all responsible parties after a thorough review of the completed inspection practice (see Sample Form for Determining Marine Surface Preparation and Coating Application Inspection Practices and all attached documentation.

6. Keywords

6.1 coating application; inspection requirements; marine surface preparation

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Standard Specification for
Bell, Cast, Sound Signalling1

This standard is issued under the fixed designation F 956; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers cast sound-signalling bells, together with bulkhead mounting plates for the smaller bells, for use on ships, boats, and other marine craft, for compliance with the rules in the convention on the International Regulations for Preventing Collisions at Sea (commonly called Colregs).2 See Appendix X1.

1.2 Bells and bulkhead mounting plate shall be sized as indicated in Section 4 (see Appendix X2).

1.3 For consistency with International Regulations, all measurements are in SI units.

2. Referenced Documents

2.1 ASTM Standards:
B 584 Specification for Copper Alloy Sand Castings for General Applications3

2.2 Other Documents:
CFR 33 Part 81–72 Implementing Rules2
CFR 33 Part 86, Subpart B, Bell or Gong2

3. Terminology

3.1 Definitions:
3.1.1 bell, n—a hollow metal instrument that rings when struck.
3.1.2 cast, v—to form by molding in a hollow form for shaping a liquid or plastic substance.
3.1.3 clapper, n—the hammer like object inside a bell.

4. Classification

4.1 Bells shall be furnished in the following sizes, based on bellmouth diameter in millimetres (see Appendix X2):
4.1.1 150 mm,
4.1.2 200 mm (2.2 kg),
4.1.3 200 mm (4.5 kg),
4.1.4 250 mm,
4.1.5 300 mm,
4.1.6 360 mm,
4.1.7 400 mm, and
4.1.8 550 mm.

4.2 Bulkhead mounting plates shall be furnished for the following bell sizes:
4.2.1 150 mm, and
4.2.2 200 mm.

5. Ordering Information

5.1 Orders for materials under this specification shall include the following information:
5.1.1 ASTM designation and year of issue.
5.1.2 Number of bells.
5.1.3 Size of bell(s) (see 4.1).
5.1.4 Additional bulkhead mounting plates (see 4.2 and 6.2.2).
5.1.5 Inscription required (see 12.1).
5.1.6 Packaging, if other than commercial (see Section 13).

6. Materials and Manufacture

6.1 Material:
6.1.1 Bell bodies, clappers, and other cast fittings and parts shall be copper alloy conforming to Specification B 584, UNS C 87200.
6.1.2 Fittings such as bolts, nuts, washers, pins, and supporting lugs shall be of copper alloy compatible with the bell castings.

6.2 Manufacture:
6.2.1 Construction shall be in accordance with Fig. 1, Fig. 2, and Fig. 3.
6.2.2 For Fig. 1 and Fig. 2, one bulkhead mounting plate shall be furnished with each bell, however, additional mounting plates may be ordered.
6.2.3 For all bells, two extra supporting nuts, washers, and acorn nuts (where used) shall be furnished.

7. Acoustic Requirements

7.1 Bells shall have full, clear, round, and farreaching tones. The sound pressure level shall not be less than 110 dB at a distance of 1 m from it.
8. Dimensions, Mass, and Permissible Variations

8.1 Dimensions and mass of bells, together with tolerances, shall conform to Fig. 1, Fig. 2, and Fig. 3.

9. Workmanship, Finish, and Appearance

9.1 Bells shall be free of cracks, burrs, sharp cutting edges, adhering sand, and other defects and blemishes affecting their life, appearance, and serviceability.

9.2 Bell exteriors and the lower part of the interior, from the bellmouth to 10 mm above the line where the clapper strikes the bell, shall have a smooth polished finish. The “visible” part of the clapper shall have a similar finish.

10. Sampling

10.1 For orders for 1 or 2 bells of the same size, each bell shall be inspected and tested.

10.2 For orders for 3 to 10 bells of the same size, 2 bells shall be selected at random. If any one of them fails to meet the requirements, then all bells in the order shall be inspected and tested.

10.3 For orders for more than 10 bells of the same size, they shall be separated into groups of 10 (or fraction thereof) for sampling purposes.

11. Inspection and Testing

11.1 Responsibility—Unless otherwise specified in the order, the manufacturer is responsible for the performance of all inspection requirements specified herein. The manufacturer may utilize his own facilities or any commercial facilities acceptable to the purchaser. The purchaser reserves the right to perform any of the inspections set forth in this specification where such inspections are deemed necessary to assure that supplies conform to the prescribed requirements. Nonconforming bells shall not be offered for delivery.

11.2 Inspections:

11.2.1 The dimensions of the bell and appurtenances shall be checked to ensure that they are within the specified tolerances.

11.2.2 The bell, without bracket or mounting plate (for 150 mm and 200 mm light), and clapper shall be weighed separately to ensure that the mass is within the specified tolerance.

11.2.3 For the 150 and 200 light sizes, the brackets shall be engaged and disengaged from each of the mounting plates to ensure portability.

11.3 Acoustic Tests—Acoustic tests shall be conducted only for the 200 mm heavy and larger bells to check the requirements of 7.1. Each bell tested shall be supported by the yoke or eyebolt with the clapper in place. The bell shall be rung by striking the bell with the clapper, activated by a lanyard.

11.3.1 The sound, produced in accordance with Appendix X1.1, shall be measured in a space with no large sound reflecting surfaces (except the floor) that are within 10 m. The sound shall be measured using a commercial sound level meter.
located at a distance of 1 m and at a height above the floor equal to that of the striking point.

12. Product Marking

12.1 Owner’s inscription shall be as specified. It shall be applied either by being cast in relief (raised) or by engraving. Size and location shall be the same as U.S. shown in Fig. 1, Fig. 2, and Fig. 3.

12.1.1 For bells intended for use on ships, boats, and other watercraft of the U.S. Army and Navy and other government agencies, the inscription shall be U.S.; size and location shall be as shown in Fig. 1, Fig. 2, and Fig. 3.

12.2 The letters ASTM and this specification number shall be engraved on the shank of each bell in figures at least 6 mm high.

12.3 The manufacturer may engrave his brand name or logo on the shank of the bell.

13. Packaging and Package Marking

13.1 No preservation is required.

13.2 Unless otherwise specified, packing shall conform to manufacturer’s normal commercial practice, and in such a manner that will ensure acceptance by common carrier and afford protection against physical and mechanical damage.
during shipment. Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.

13.3 For procurements by the U.S. Department of Defense for long-term storage or overseas shipment, the requirements of Annex A1 apply. In such case the required level of packing shall be specified.

14. Keywords

14.1 bell; bell casting; clapper; sound pressure level; sound signalling

ANNEX

(Mandatory Information)

A1. PACKING FOR DoD PROCUREMENTS

A1.1 Applicable Documents for This Annex Only:
A1.1.1 Federal Specifications:
PPP-B-576 Box, Wood, Cleated, Veneer, Paper Overlaid
PPP-B-585 Boxes, Wood, Wirebound
PPP-B-591 Boxes, Fiberboard, Wood-Cleated
PPP-B-601 Boxes, Wood, Cleated-Plywood
PPP-B-621 Boxes, Wood, Nailed and Lock Corner
PPP-B-636 Box, Fiberboard
PPP-B-640 Boxes, Fiberboard, Corrugated, Triple, Wall
A1.1.2 Military Standard:
MIL-STD-129 Marking for Shipment and Storage
A1.1.3 Other Documents:
Official Classification Committee Rules
Uniform Freight Classification Rules

A1.2 Preservation—None required.

A1.3 Packing—The bells shall be cushioned, blocked, or braced within the containers in a manner to prohibit movement and the clappers shall be secured or cushioned to prevent knocking. Unless otherwise specified in the order, one bell shall be packed per container. When more than one bell is required to be packed in each container, the gross mass of the wood or wood-cleated boxes shall not exceed approximately 100 kg.

A1.3.1 Level A

Bells shall be packed in containers conforming to any one of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Class 2</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 3</td>
</tr>
<tr>
<td>PPP-B-591</td>
<td>Weather-resistant</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Domestic type</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 1</td>
</tr>
<tr>
<td>PPP-B-636</td>
<td>Weather-resistant</td>
</tr>
<tr>
<td>PPP-B-640</td>
<td>Class 2</td>
</tr>
</tbody>
</table>

A1.3.1.1 Boxes shall be closed and banded in accordance with the applicable box specification or appendix thereto.

A1.3.2 Level B

Bells shall be packed in boxes conforming to any of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Class 2</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 2 use</td>
</tr>
<tr>
<td>PPP-B-591</td>
<td>Weather-resistant</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Domestic type</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 1</td>
</tr>
<tr>
<td>PPP-B-636</td>
<td>Weather-resistant</td>
</tr>
<tr>
<td>PPP-B-640</td>
<td>Class 2</td>
</tr>
</tbody>
</table>

A1.3.2.1 Box closure and banding or reinforcement shall be as specified in the box specification or appendix thereto with Method V closure applicable to PPP-B-636 boxes. The gross mass of wood or wood-cleated boxes shall not exceed 100 kg.

A1.3.3 Level C

Bells shall be packed as specified for Level B except that the containers may be of the non-weather-resistant type or grade and Method I closure shall apply for PPP-B-636 boxes.

A1.4 Marking—In addition to any special marking required by the order, shipments shall be marked in accordance with MIL-STD-129.
X1. EXCERPTS FROM U.S. COAST GUARD RULES

X1.1 For general information, the following is quoted from U.S. Coast Guard Commandant Instruction M 16672.2: Navigation Rules, International-Inland, Division II, Part D, Rule 33—Equipment for Sound Signals.

“(A) A vessel of 12 meters or more in length shall be provided with a whistle and a bell and a vessel of 100 meters more in length, shall, in addition, be provided with a gong, the tone and sound of which cannot be confused with that of the bell. The whistle, bell and gong shall comply with the specifications in Annex III to these regulations. The bell or gong, or both, may be replaced by other equipment having the same respective sound characteristics, provided that manual sounding of the prescribed signals shall always be possible.

(B) A vessel of less than 12 meters in length shall not be obliged to carry the sound signalling appliances prescribed in Paragraph (A) of this rule but if she does not, she shall be provided with some other means of making an efficient sound signal.

In Addition:

Division II, Part E, Annex III—Technical Detail of Sound Signalling Appliances, and 33 CFR Part 86, Subpart B:

2. Bell or Gong:

(A) Intensity of Signal—A bell or gong, or other device having similar sound characteristics shall produce a sound pressure level of not less than 110 dB at a distance of 1 meter from it.

(B) Construction—Bells and gongs shall be made of corrosion-resistant material and designed to give a clear tone. The diameter of the mouth of the bell shall be not less than 300 mm for vessels of 20 meters or more in length, and shall be not less than 200 mm for vessels of 12 meters or more but of less than 20 meters in length. Where practicable, a power-driven bell striker is recommended to ensure constant force but manual operation shall be possible. The mass of the striker shall be not less than 3 % of the mass of the bell.

3. Approval—The construction of sound signal appliances, their performance and their installation on board the vessel shall be to the satisfaction of the appropriate authority of the state whose flag the vessel is entitled to fly.

Division II, Part E, Subpart B—Bell or Gong, Inland Rules:

86.21 Intensity of Signal—A bell or gong, or other device having similar sound characteristics shall produce a sound pressure level of not less than 110 dB at 1 meter.

86.23 Construction—Bells and gongs shall be made of corrosion-resistant material and designed to give a clear tone. The diameter of the mouth of the bell shall be not less than 300 mm for vessels of more than 20 meters in length, and shall be not less than 200 mm for vessels of 12 to 20 meters in length. The mass of the striker shall be not less than 3 % of the mass of the bell. The striker shall be capable of manual operation.

Note X1.1—When practicable, a power-driven bell striker is recommended to ensure constant force.”

X2. GUIDELINES FOR USE OF BELLS

X2.1 The ship’s bells covered by this specification are intended for use on the following:

X2.1.1 Bell Type:

X2.1.1.1 150 mm and 200 mm (2.2 kg)
Small craft and boats less than 12 m in length, quarter-deck bells and fire bells.

X2.1.1.2 200 mm (4.5 kg)—Boats 12 m to 20 m in length and ships watch and fire bell.

X2.1.1.3 250 mm—Vessels 12 m to 20 m in length, submarines less than 100 m in length.

X2.1.1.4 300 mm—Vessels 20 m to 50 m in length, submarines 100 m and over in length.

X2.1.1.5 360 mm—Vessels 50 m to 75 m in length.

X2.1.1.6 400 mm—Vessels 75 m to 150 m in length.

X2.1.1.7 550 mm—Vessels over 150 m in length.
1. Scope

1.1 This specification covers gongs for use on ships 100 m or more in length, as required by International Regulations (see Appendix X1).

1.2 For consistency with International Regulations, all measurements are in SI units.

2. Referenced Documents

2.1 ASTM Standards:
- A 167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
- A 276 Specification for Stainless Steel Bars and Shapes
- D 3951 Practice for Commercial Packaging

2.2 American Welding Society Standard:
- AWS D1.1 Structural Welding Code

2.3 Federal Specifications:
- PPP-B-576 Box, Wood, Cleated, Veneer, Paper Overlay
- PPP-B-585 Boxes, Wood, Wirebound
- PPP-B-591 Boxes, Fiberboard, Wood-cleated
- PPP-B-601 Boxes, Wood, Cleated Plywood
- PPP-B-621 Boxes, Wood, Nailed and Lock Corner

2.4 Military Standard:
- MIL-STD-129 Marking for Shipment and Storage

3. Ordering Information

3.1 Orders for gongs under this specification shall include the following information:

3.1.1 ASTM designation and year of issue.

3.1.2 Number of gongs.

3.1.3 Packaging and marking, if other than commercial.

4. Materials and Manufacture

4.1 Materials:

4.1.1 The gong cylinder, brackets, clapper rod, “U” bracket, washers, and clapper support pin shall be of stainless steel, in accordance with Specification A 167, UNS number S31600.

4.1.2 The clapper mass shall be of cast alloy steel in accordance with Specification A 276, UNS S31600.

4.1.3 The support bolt, nut, flat washer, and cotter pins shall be of stainless steel compatible with the other materials.

4.2 Welding:

4.2.1 Welding shall be of the type and sizes shown in Fig. 1 and Fig. 2, and in accordance with Standard AWS D1.1.

4.3 Manufacture:

4.3.1 Fig. 1 shows the general arrangement of the assembled gong, as well as details of the gong cylinder. Fig. 2 shows details of the brackets, clapper, and miscellaneous fittings.

4.3.2 The gong cylinder may be made from two pieces welded together, instead of one piece. Two piece construction shall be annealed to remove residual stresses.

4.3.3 Sharp corners and edges of the cylinder shall be broken.

4.3.4 The two brackets shall be welded together before being welded to the cylinder. The flanged ends of the brackets may be left straight and not shaped to the cylinder.

4.3.5 The clapper mass shall be welded to the clapper rod before forming the second eye.

4.4 Extra Parts:

4.4.1 Two extra supporting nuts and flat washers shall be furnished with each gong.

5. Acoustic Requirements

5.1 The sound characteristics shall produce a sound pressure level of not less than 110 dB at a distance of 1 m.

6. Dimensions and Tolerances

6.1 Dimensions shall conform to Fig. 1 and Fig. 2.

6.2 Tolerances shall be as follows:

6.2.1 Up to 10 mm: ± 1 mm.

6.2.2 10 mm to 50 mm: ± 2 mm.

6.2.3 Over 50 mm: ± 3 mm.
7. Workmanship, Finish, and Appearance

7.1 Gongs shall be free from cracks, burrs, sharp cutting edges, and other defects affecting their life, appearance, and serviceability.

8. Sampling

8.1 For orders of 1 or 2 gongs, each gong shall be inspected and tested.
8.2 For orders of 3 to 10 gongs, 2 gongs shall be selected at random. If any one of them fails to meet requirements, then all gongs in the order shall be inspected and tested.

8.3 For orders of more than 10 gongs, they shall be separated into groups of 10 (or fraction thereof) for sampling purposes.

9. **Inspection and Testing**

9.1 **Responsibility**—Unless otherwise specified in the purchase order, the manufacturer shall be responsible for the performance of all inspection and testing specified herein. The manufacturer may utilize his own facilities or any commercial facility acceptable to the purchaser. The purchaser reserves the right to perform any of the inspections and tests set forth where such are deemed necessary to ensure that supplies conform to prescribed requirements. Nonconforming gongs shall not be offered for delivery.

9.2 **Inspection**—The dimensions of the gong and its components shall be checked to ensure that they are within specified tolerances.

9.3 **Acoustic Test**—Each gong tested shall be supported as shown in Fig. 1 with the clapper in place. The gong shall be rung by striking the cylinder with the clapper, activated by a lanyard. The sound, produced in accordance with Appendix X1, shall be measured in a space with no large sound reflecting surfaces (except the floor) that are within 10 m. The sound shall
be measured using a commercial sound level meter located at a distance of 1 m and at a height above the floor equal to that of the striking point.

10. Product Marking

10.1 The letters “ASTM” and this specification number shall be engraved on the gong cylinder in figures at least 6 mm high.

10.2 The manufacturer may engrave his brand name or logo on the inside of the gong cylinder.

11. Packaging and Package Marking

11.1 No preservation is required.

11.2 Unless otherwise specified, packaging and marking shall conform to Practice D 3951 and shall, when specified, include bar code marking.

11.3 For government procurements for long-term storage or overseas shipment, the requirements of Annex A1 apply. In such case the required level of packaging shall be specified.

12. Supersession

12.1 This specification is intended to supersede Bureau of Ships drawing S2408-F-921899. The cancellation of Bureau of Ships S2408-F-921899 drawing and adoption of this specification can only be effected by the Navy.

Note 1—The Bureau of Ships was one of the predecessors of the Naval Ship/Sea Systems Command.

13. Keywords

13.1 clapper; gong; gong cylinder; signaling; sound signaling

ANNEX

(Mandatory Information)

A1. PACKING FOR DOD PROCUREMENTS

A1.1 Applicable documents for this annex only.

A1.1.1 Federal Specifications—PPP-B-576, PPP-B-585, PPP-B-591, PPP-B-601, and PPP-B-621.

A1.2 Preservation—None required.

A1.3 Packing—The gong shall be cushioned, blocked, or braced within the container in a manner to prohibit movement, and the clappers shall be secured or cushioned to prevent knocking. Unless otherwise specified in the purchase order, one gong shall be packed per container. When more than one gong is required to be packed in each container, the gross mass of the wood or wood-cleated boxes shall not exceed approximately 100 kg (220 lbs).

A1.3.1 Level A—Gongs shall be packed in containers conforming to any of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-585</td>
<td>Class 3</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Overseas</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 2</td>
</tr>
</tbody>
</table>

A1.3.1.1 Boxes shall be closed and banded in accordance with the applicable box specification.

A1.3.2 Level B—Gongs shall be packed in boxes conforming to any of the following specifications at the option of the manufacturer.

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Class 2</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 1 or 2</td>
</tr>
<tr>
<td>PPP-B-591</td>
<td>Weather–resistant</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Domestic</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 1</td>
</tr>
</tbody>
</table>

A1.3.2.1 Box closures shall be as specified in the applicable box specification.

A1.3.3 Level C—Gongs shall be packed and have container closure as specified for Level B, except that containers may be of the domestic type or class.

A1.3.4 Commercial packing shall conform to 11.2.

A1.4 Marking—In addition to any special marking required by the order, shipments shall be marked in accordance with MIL-STD-129 or Practice D 3951 as applicable and when specified shall include bar code markings.
X.1. EXCERPTS FROM U. S. COAST GUARD RULES

X.1.1 For general information, the following is quoted from U. S. Coast Guard Commandant Instruction M16672.2A: Navigation Rules, International-Inland.

X.1.1.1 Division II, Part D, Rule 33—Equipment for Sound Signals:

(b) Construction—Bells and gongs shall be made of corrosion-resistant material and designed to give a clear tone. The diameter of the mouth of the bell shall be not less than 300 mm for vessels of 20 m or more in length, and shall be not less than 200 mm for vessels of 12 m or more but of less than 20 m in length. Where practicable, a power-driven bell striker is recommended to ensure constant force but manual operation shall be possible. The mass of the striker shall be not less than 3 % of the mass of the bell.

X.1.1.2 Division II, Part E, Annex III—Technical Details of Sound Signal Appliances: International Rules:

X.1.1.2.2 Bell or Gong:

(a) Intensity of Signal—A bell or gong, or other device having similar sound characteristics shall produce a sound pressure level of not less than 110 dB at 1 m.

(b) Construction—Bells and gongs shall be made of corrosion-resistant material and designed to give a clear tone. The diameter of the mouth of the bell shall be not less than 300 mm for vessels of 20 m or more in length, and shall be not less than 200 mm for vessels of 12 m or more but of less than 20 m in length. Where practicable, a power-driven bell striker is recommended to ensure constant force but manual operation shall be possible. The mass of the striker shall be not less than 3 % of the mass of the bell.

X.1.1.3 Division II, Part E, Subpart B—Bell or Gong—Inland Rules:

X.1.1.3.1 Intensity of Signal—A bell or gong, or other device having similar sound characteristics shall produce a sound pressure level of not less than 110 dB at 1 m.

X.1.1.3.2 Construction—Bells and gongs shall be made of corrosion-resistant material and designed to give a clear tone. The diameter of the mouth of the bell shall be not less than 300 mm for vessels of more than 20 m in length, and shall be not less than 200 mm for vessels of 12 to 20 m in length. The mass of the striker shall be not less than 3 % of the mass of the bell. The striker shall be capable of manual operation.

NOTE X.1.1—When practicable, a power-driven bell striker is recommended to ensure constant force.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

Standard Specification for
Panama Canal Pilot Platform

This standard is issued under the fixed designation F 985; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides design and construction details for Panama Canal pilot platforms.

1.2 Platforms shall be placed aboard the vessel in accordance with the requirements of the Panama Canal Commission and Title 35 of the Code of Federal Regulations.

1.3 The values stated in metric units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:
   B 221 Specification for Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes
2.2 Federal Standard:
   Code of Federal Regulations, Title 35 Panama Canal Regulations (Parts 1 through 299)

3. Ordering Information

3.1 Pilot platforms shall be ordered by this ASTM designation and year of issue.

3.2 Paint finish (if other than standard).

4. Materials and Methods

4.1 Platforms shall be welded-aluminum construction in accordance with Specification B 221, Alloy 5086.

4.2 Decking shall be serrated-aluminum grating.

4.3 Canopy shall be of vinyl-nylon construction with sewn seams and metallic grommets.

4.4 Canopy tie-downs shall be 1/8-in. (DN 4-mm) nylon line.

4.5 Paint finish, if required, shall be in accordance with customer specifications.

5. Dimensions, Weight, and Permissible Variations

5.1 Dimensions as indicated in Figs. 1-7.

5.2 The approximate unit weight is 1250 N.

5.3 The construction tolerance is 4 mm, except bolt hole location 1 mm.

6. Workmanship, Finish, and Appearance

6.1 Shelters shall be free of weld splatter, sharp edges, and burrs injurious to personnel.

Standard Specification for Suction Strainer Boxes

This standard is issued under the fixed designation F 986; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the design, materials, and construction of strainer boxes for use in ships’ bilges and other such tank locations that require trash protection for suction pipes and pumps.

1.2 This specification covers pipe sizes from NPS 1½ through NPS 16 (see Note 1).

NOTE 1—The dimensionless designator NPS (nominal pipe size) has been substituted in this specification for such traditional terms as “nominal diameter,” “size,” and “nominal size.”

1.3 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

A 36/A 36M Specification for Carbon Structural Steel
A 123/A 123M Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
F 593 Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
F 594 Specification for Stainless Steel Nuts
F 708 Practice for Design and Installation of Rigid Pipe Hangers

2.2 American Welding Society Standard:

AWS D1.3 Structural Welding Code—Sheet Steel

3. Classification

3.1 This specification covers two types of strainer boxes.

3.1.1 Type 1—Strainer boxes with pipe clamp centered on the top of the strainer box (see Fig. 1).

3.1.2 Type 2—Strainer boxes with the pipe clamp off center in the top of the strainer box (see Fig. 2).

4. Ordering Information

4.1 Ordering information required is as follows.

4.1.1 ASTM specification and year of issue.

4.1.2 Type.

4.1.3 Size (suction pipe NPS).

4.1.4 Dimensions G and H (Type 2 only).

4.1.5 Number of each type and size.

5. Materials and Manufacture

5.1 For information on materials, see Table 1.

5.2 Welding shall be in accordance with AWS D1.3.

5.3 Perforated sheet metal shall have 3/8-in. diameter holes on staggered ½-in. centers, 51% open area.

6. Dimensions and Tolerances

6.1 Tolerance—± 1/16 in.

6.2 Strainer Box Dimensions:

6.2.1 Type 1—See Table 2.

6.2.2 Type 2—See Table 3.

7. Workmanship, Finish, and Appearance

7.1 Strainer boxes shall be hot galvanized in accordance with Specification A 123/A 123M after fabrication. The galvanizing shall be a minimum of 2 mils thick.

7.2 Strainer boxes shall be free of defects, burrs, and sharp edges.

8. Installation

8.1 Strainer boxes are normally installed on suction pipes in ballast and bilge spaces.

8.2 Minimum suction pipe or tank bottom clearances are indicated in Column “F” in Table 2 and Table 3. Dimension callout is based on ½ × the tailpipe nominal pipe size.

8.3 Tank structure and sloping bottom structure may obscure the above clearance down to the limit of the resulting periphery clear area, being 1.5 × the inside diameter of the tailpipe. Structure outside the limit of ½ the pipe NPS need not be considered as obstructing flow.
NOTE 1—Tab location to suit perforated holes.

*A Minimum dimensions A and B are independent of one another and relate only to required clearances for the clamp assembly and suction requirements. The total minimum perimeter for the box is shown in the undesignated fourth column.

*B See 8.2 and 8.3 of this specification.
Standard Specification for Portable Intermediate Flush Deck Stanchion

This standard is issued under the fixed designation F 987; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the design, construction, and installation of intermediate portable flush deck stanchions. Intermediate stanchion is defined as any stanchion that is not an end or corner stanchion.

1.2 Stanchions shall be used on interior and exterior decks, to provide temporary protection to minimize the danger of personnel falling overboard or to a lower level in the ship in areas where the installation of a fixed system would interfere with vessel operations.

1.3 Stanchions may be used with ¾-in. (9.5-mm) galvanized close link chain or wire rope lifelines ¾-in. (14-mm) top course, ¼-in. (11-mm) lower courses.

1.4 This specification covers only the stanchions and does not cover requirements for the chain or wire rope lines to be supported by the stanchion.

1.5 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

A 106 Specification for Seamless Carbon Steel Pipe for High-Temperature Service
A 123/A 123M Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
A 182/A 182M Specification for Forged or Rolled Alloy-Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service
F 783 Specification for Staple, Handgrab, Handle, and Stirrup Rung

2.2 ANSI/ASME Standards:

B 16.11 Forged Steel Fittings, Socket-Welding, and Threaded
B 16.15 Cast Bronze Threaded Fittings

2.3 ANSI/AWS Standard:

D 1.1 Structure Welding Code

2.4 Code of Federal Regulations:

Title 46 Shipping, Parts 70 to 89, Subpart 72.40

3. Classification

3.1 Portable flush deck stanchions shall be available in two types:

3.1.1 Type I—Two-course portable flush deck stanchions (see Fig. 1).

3.1.2 Type II—Three-course portable flush deck stanchions (see Fig. 2).

4. Ordering Information

4.1 Orders for portable flush deck stanchions under this specification shall include the following information:

4.1.1 ASTM designation and year of issue (that is, F 987 – 04).

4.1.2 Type.

4.1.3 Quantity.

4.1.4 If socket plug stowage coupling is required.

4.2 Lifelines shall be ordered separately.

5. Materials and Manufacture

5.1 Materials:

5.1.1 Pipe for stanchion shall be in accordance with Specification A 106, Grade A or B, NPS 1½ , Schedule 80, carbon steel.

5.1.2 Staple shall be in accordance with Specification F 783, Table 1, Type II.

5.1.3 Socket shall be in accordance with Specification A 182/A 182M, ANSI B 16.11, NPS 1½ , 3000 lb, Type 316L, stainless steel (1½-6 UNC-2B).
5.1.4 Socket plug shall be in accordance with ANSI B 16.15, NPS 1½, Bronze-Threaded Class 250, countersunk square head (1½-6 UNC-2B).

5.2 Manufacture:

5.2.1 Welding shall be as shown on Figs. 1-3 and shall be in accordance with ANSI/AWS D1.1.
5.2.2 Stanchion assembly, excluding socket and socket plug, shall be hot-galvanized in accordance with Specification A 123/A 123M.

6. Other Requirements

6.1 Stanchions shall be installed in accordance with contact requirements or as specified below:

6.1.1 Portable flush deck stanchions shall not be used on inclined ladders.

6.1.2 Type I Stanchions—Required on bridges, platforms, walkways, and elsewhere as needed in accordance with 46 CFR (see 3.1).

6.1.3 Type II Stanchions—Required along the exposed peripheries of freeboards, weather decks and superstructure decks in accordance with 46 CFR (see 3.1).

7. Installation

7.1 The intended installation is to follow these general guidelines:

7.1.1 There shall be a maximum clearance of 4 in. (101.6 mm) between stanchion centerline and other structure.

7.1.2 Sockets shall be installed and aligned so that stanchions are perpendicular to the ship’s baseline.

7.1.3 Stanchions shall be installed with 10 ft (3050 mm) maximum between centers; 6 ft (1830 mm) minimum.

7.1.4 Socket plugs shall be provided for installation in deck when stanchions are stowed.

7.1.5 The top of stanchions may be provided with a coupling for stowage of socket plugs when stanchions are in use. See Fig. 4.

8. Dimensions and Tolerances

8.1 Dimensions for Type I—Two course portable flush deck stanchions shall be in accordance with Fig. 1.

8.2 Dimensions for Type II—Three course portable flush deck stanchions shall be in accordance with Fig. 2.

8.3 The dimensions are as indicated.

8.4 Socket, socket plug, stanchion, and coupling shall have tolerances in accordance with ANSI B16.15. All other dimensions shall have a tolerance of ±¼ in. (6.35 mm).

9. Workmanship, Finish, and Appearance

9.1 Stanchions shall be free of weld spatter, slag splinters, sharp edges, burrs, projections, and other defects hazardous to personnel.

9.2 Galvanizing destroyed after fabrication shall be repaired by the application of cold-galvanizing compound.

10. Testing

10.1 Hammer test deck sockets for soundness and strength.

10.2 Test at least one stanchion of each platform or deck by application of a load horizontally in accordance with the methods in “Strength and Stiffness of Metal Railing Systems and Rails for Buildings.”

11. Packaging

11.1 Loose hardware shall be packaged and wired to stanchion.

12. Keywords

12.1 deck stanchions; portable intermediate flush deck stanchion; stanchions

Standard Specification for
Docking/Drain Plug and Boss Assemblies [Metric]1

This standard is issued under the fixed designation F 991M; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope
1.1 This specification provides design, construction, and
purchasing criteria for docking/drain plug and boss assemblies.
1.2 Assemblies are intended for installation in shell, rudder,
and tank bottom plate from 8 through 38 mm.
1.3 Assemblies shall be installed at the lowest point of a
tank or rudder for draining during dry docking.
1.4 The values stated in SI units are to be regarded as the
standard.

2. Referenced Documents
2.1 ASTM Standards: 2
B 164 Specification for Nickel-Copper Alloy Rod, Bar, and
Wire
2.2 Other Documents:
ABS Rules for Building and Classing Steel Vessels3
ANSI B2.1 Standard Pipe Threads Except Dryseal4

3. Classification
3.1 Docking plugs and bosses shall be classified as follows:
3.1.1 Type I—Docking plug and bosses for plating from 8 to
15 mm (see Fig. 1).
3.1.2 Type II—Docking plug and bosses for plating greater
than 15 to 38 mm (see Fig. 2).

4. Ordering Information
4.1 Orders for material under this specification shall include
the following:
4.1.1 ASTM designation and year of issue.
4.1.2 Type (See Section 3).
4.1.3 Optional nonstandard materials.

5. Materials and Manufacture
5.1 Materials:
5.1.1 Boss—ABS Grade A or B, plate or bar.
5.1.2 Plug—Specification B 164 rod or bar.
5.1.3 Other materials may be substituted to suit hull con-
struction as approved by regulatory bodies.
5.2 Manufacture:
5.2.1 Plugs and bosses shall be machined.
5.2.2 Threads shall be in accordance with ANSI B2.1.

6. Dimensions and Tolerances
6.1 Dimensions shall be as indicated in Fig. 1 and Fig. 2.
6.2 Tolerance shall be ±1.5 mm.
6.3 Mass shall be as follows:

<table>
<thead>
<tr>
<th></th>
<th>Type I</th>
<th>Type II</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boss</td>
<td>1.6 kg</td>
<td>5.7 kg</td>
</tr>
<tr>
<td>Plug</td>
<td>0.6 kg</td>
<td>1.0 kg</td>
</tr>
<tr>
<td>Total</td>
<td>2.2 kg</td>
<td>6.7 kg</td>
</tr>
</tbody>
</table>

7. Installation
7.1 All welding shall be to the standards of the Rules for
Building and Classing of Steel Vessels (ABS).
7.2 Threads shall be adequately protected during installa-
tion.
7.3 Fill plug face with portland cement or other suitable
compound and finish flush with face of boss.
7.4 Boss shall be inserted so that drain grooves run forward
and aft.
7.5 Plugs shall not be installed near large structural discon-
tinuities.
7.6 Adjacent shell plating weld joint preparation shall be as
required to ensure full penetration.

8. Keywords
8.1 boss assemblies; docking/drain plug; drydocking; rud-
der; shell; tank bottom plate

FIG. 1 Type I
Standard Specification for Valve Label Plates

This standard is issued under the fixed designation F 992; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the materials, dimensions, inscription, and methods of inscribing for shipboard valve label plates.

1.2 Fasteners shall be ordered separately and are not included in this specification.

1.3 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:
A 167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
B 36 Specification for Brass Plate, Sheet, Strip, and Rolled Bar
B 209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
B 580 Specification for Anodic Oxide Coatings on Aluminum
D 709 Specification for Laminated Thermosetting Materials
2.2 Other Documents:
American Bureau of Shipping Rules for Building and Classing Steel Vessels
ANSI Y1.1 Abbreviations

3. Classification

3.1 Label plates shall be classified by type, grade, class, size, and letter size in accordance with material and method of inscribing, method of attachment, thickness of sheet, strip, or plate, dimensions, and letter size to be used.

3.2 Types and Materials:
3.2.1 Type I—Anodized aluminum, engraved.
3.2.2 Type II—Anodized aluminum, metal photo.
3.2.3 Type III—Stainless steel, engraved.
3.2.4 Type IV—Brass, engraved.
3.2.5 Type V—Plastic, engraved.
3.3 Grades and Methods of Attachment:
3.3.1 Grade A—Adhesive on metal bracket (backing plate) (Sizes A through J).
3.3.2 Grade B—Metal strapping or screw (Sizes A through J).
3.3.3 Grade C—Welding (Sizes A through J) See also the American Bureau of Shipping Standards.
3.3.4 Grade D—Secured by handwheel nut (Sizes K through R).
3.3.5 Grade E—Connection to valve stem, bonnet, or flange (Size S).
3.4 Class and Thickness:
3.4.1 Class 1—1/8 in.
3.4.2 Class 2—16 gage.
3.4.3 Class 3—20 gage.
3.4.4 Class 4—24 gage.
3.5 Size and Dimensions:
(length by width) or (outside diameter (OD) by inside diameter (ID)).
3.5.1 Size A—Rectangular 2 by % in.
3.5.2 Size B—Rectangular 2 by % in.
3.5.3 Size C—Rectangular 3 by % in.
3.5.4 Size D—Rectangular 3 by % in.
3.5.5 Size E—Rectangular 3 by % in.
3.5.6 Size F—Rectangular 4 by % in.
3.5.7 Size G—Rectangular 4 by % in.
3.5.8 Size H—Rectangular 4 by % in.
3.5.9 Size J—Rectangular 4 by % in.
3.5.10 Size K—Circular % in.
3.5.11 Size L—Circular % in.
3.5.12 Size M—Circular % in.
3.5.13 Size N—Circular 2 by % in.
3.5.14 Size P—Circular 2 by % in.
3.5.15 Size R—Circular 3 by % in.
3.5.16 Size S—Rectangular, 5 by % in. with % -in. diameter hole (see Fig. 3). (To be used with Type 3, Grade E only).
3.6 Letter Size:
4. Ordering Information

4.1 Orders for material under this specification shall include the following:
4.1.1 ASTM Designation and year of issue.
4.1.2 Type.
4.1.3 Grade.
4.1.4 Class.
4.1.5 Size.
4.1.6 Letter size.
4.1.7 Color of lettering (if other than default color black, standard red words, or white when plastic is used).
4.1.8 Inscription (as to be put on label).
4.1.9 Optional characteristics
4.1.9.1 A first option is to indicate "to suit" instead of a size of plate when ordering and the engraver will fit the plate to suit the applicable requirements.
4.1.9.2 A second option is to indicate "to suit" instead of a letter size when ordering and the engraver will fit the lettering (minimum of 1/8-in. letter size) onto the plate size chosen.
4.1.9.3 When nonstandard colors are needed for the label plates, the purchaser should specify.
4.1.9.4 When a letter style other than gothic lettering or arabic numerals is required, the purchaser should specify.

5. Materials and Manufacture

5.1 Materials:
5.1.1 Stainless steel, Specification A 167, Type 316.
5.1.2 Brass, Specification B 36, UNSC 26000.
5.1.3 Aluminum, Specification B 209, Alloy 5052.
5.1.4 Plastic, Specification D 709, Grade ES.
5.1.5 Spar varnish.
5.2 Manufacture:
5.2.1 Holes shall not be provided in rectangular plates unless the method of attachment (grade) is Grade B. In this case approximately ½-in. left and right margins shall be provided.
5.2.2 Edges of label plates shall be smooth.
5.2.3 Letters (engraved or metal photo), except as noted in 6.4, shall be black and the background natural. When plastic label plates are used, the core (lettering) shall be white and the outer layer (background) shall be black.
5.2.4 When sea valve label plates are used, or when cautionary words such as “Danger” and “Warning” or fuel words are part of the inscription, the lettering (engraved or metal photo) shall be red and the background natural. When plastic label plates are used, the core of the plate (lettering) shall be white and the outer layer (background) shall be red.
5.2.5 The front of aluminum label plates shall be coated with moisture-resistant spar varnish.
5.2.6 Engraved plates shall be engraved to a minimum depth of 0.008 in. When plastic label plates are used, the depth of engraving shall be sufficient to ensure uniform penetration of the top layer.
5.2.7 A symmetrical and well-balanced arrangement of letters and lines shall be attained with maximum legibility.
5.2.8 Gothic lettering and arabic numerals shall be used unless specified otherwise.
5.2.9 For circular label plates, a ¼-in. border shall be used when plates are under 2 in. in outside diameter; otherwise, a 1/8-in. border shall be used.
5.2.10 Aluminum plates shall be coated in accordance with Specification B 580.

6. General Requirements

6.1 Inscription on label plates shall include the system identification number, valve identification number, and the function of the valve. The pressure in line, where the line is coming from or going to, or both, may be included along with any other pertinent information.
6.2 When using label plates without backing, the minimum thickness shall be 20 gage.
6.3 Exterior label plates shall be stainless steel with a minimum thickness of 16 gage (SST gage, 0.0595 in.) except as noted in 6.4.
6.4 Exterior label plates for valve deck access boxes shall be a minimum of 1/8-in. thickness attached by seal welding as close as possible to the terminal. Label plate material shall be compatible with the deck or bulkhead material.
6.5 Label plates shall be located to ensure maximum visibility.
6.6 When a valve is installed behind an access panel or above a ceiling, an additional label plate shall be installed where normally visible as well as a label plate on the valve itself.
6.7 When using the stainless steel Grade D label plate, the plate shall be attached to the valve stem, bonnet, or flange bolt as appropriate.
6.8 Abbreviations shall be in accordance with ANSI Y1.1.
6.9 The use of 24-gage metal is limited to the use where anodized aluminum is used as the label metal and the method of attachment is Grade A. The metal bracket can be shaped such as Size S.
6.10 When circular label plates are used, it is the purchaser’s responsibility to choose title lengths and letter sizes such that the engraving will not be hidden by any valve components.
6.11 Adhesive-backed plates shall not be used on curved surfaces, surfaces not solid, or where the temperature could exceed 250°F.
6.12 Electrically insulated material shall be used as a backing when metal label plates are attached to bare valves or piping to prevent electrolytic corrosion between dissimilar metals.

7. Dimensions and Tolerances

7.1 Dimensions are as indicated in Fig. 1, Fig. 2, and Fig. 3.
7.2 Tolerances are ±1/8 in., except hole location ±1/2 in., engraving depth +0.002, −0.000 in., and letter size ±1/2 in.
8. Keywords

8.1 label plate; marine technology; ships; valve label plate

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

1. Scope
1.1 This specification covers the application, design, and materials for valve locking devices.
1.2 Locking devices Types I and II described in this specification are designed to secure the valve in a fully opened or completely closed position.
1.3 This specification does not apply to valves equipped with locking devices from the valve manufacturer, unless this standard is invoked in the procurement ordering data for the valve or its locking device, or both.
1.4 This specification is intended to supersede NASEA drawing S4824-1385509. However, cancellation of that drawing and adoption of this specification can only be effected by the navy.

2.1 ASTM Standards:
A 36/A36M Specification for Carbon Structural Steel
A 167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
A 492 Specification for Stainless Steel Rope Wire
A 668/A 668M Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use
B 209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
B 580 Specification for Anodic Oxide Coatings on Aluminum
F 708 Practice for Design and Installation of Rigid Pipe Hangers
2.2 Other Documents:
ANSI B18.1 Small Solid Rivets
American Welding Society D1.1 on Steel

3. Classification
3.1 Valve locking devices shall be classified by the following types and grades in accordance with the method of locking and material used.
3.2 Types:
3.2.1 Type I—Wire rope assembly (see Fig. 1 Fig. 2).
3.2.2 Type II—Handwheel latch (see Fig. 3 Fig. 4).
3.2.3 Type III—Locking shield (see Fig. 5).
3.3 Grades:
3.3.1 Grade A—Stainless steel, Specification A 167, Type 316.
3.3.2 Grade B—Anodized aluminum, Specification B 209, Alloy 5052.
3.3.3 Grade C—Carbon steel, commercial quality steel (see Specification A 36/A36M).

4. Ordering Information
4.1 Orders for material under this specification shall include the following:
4.2 ASTM Designation and year of issue.
4.3 Type.
4.4 Grade.
4.5 Padlock Size (if necessary).
4.6 Rubber Coating (if necessary).
4.7 Necessary Dimensions:
4.7.1 Type I:
4.7.1.1 Length of wire strand.
4.7.1.2 Diameter of pipe.
4.7.2 Type II:
4.7.2.1 Maximum height (fully opened).
4.7.2.2 Minimum height (fully closed).
4.7.2.3 Handwheel thickness.
4.7.2.4 Handwheel depth.
4.7.2.5 Diameter at location of attachment.

---

9 Available from American National Standards Institute, 25 W. 43rd St., 4th Floor, New York, NY 10036.
4.7.3 Type III:
4.7.3.1 Depth.
4.7.3.2 Height.
4.7.3.3 Width.

4.7.3.4 Outside diameter (OD) of pipe.
5. Materials and Manufacture

5.1 Materials:

5.1.1 Type I Materials:

5.1.1.1 Pipe Clamp—Indicate diameter, similar to Practice F 708, Fig. 1, material specified by grade.

5.1.1.2 Ring Link—Size to be not less than clearance shown in Practice F 708, Table 3, Column F, material specified by grade.

5.1.1.3 Common Wire Strand—\(\frac{3}{16}\)-in. diameter, seven strands of seven wires each, stainless steel, Specification A 492, Alloy 316.

5.1.1.4 Tiller Rope Clamp—\(\frac{3}{16}\)-in. cable size, manufacturer, stainless steel (optional).

5.1.1.5 Rigid Eye Spring Hook—\(\frac{3}{8}\)-in. eye diameter, \(\frac{1}{2}\)-in. snap opening, plated forged steel, Specification A 668/A 668M, Class D.

5.1.1.6 Sleeve—Swaging, oval, for \(\frac{3}{16}\)-in. diameter wire rope, copper.

5.1.2 Type II Materials:

5.1.2.1 Modified Pipe Clamp—Indicate diameter, similar to Practice F 708, Fig. 1, material specified by grade.

5.1.2.2 Flat Head Rivet—\(\frac{1}{4}\)-in. nominal size, ANSI B18.1, material specified by grade.

5.1.2.3 Single Acting Quick Release Pin—\(\frac{1}{4}\)-in. nominal size by \(\frac{3}{16}\)-in. grip, stainless steel, Specification A 167, Type 316.

5.1.2.4 Lanyard—Wire rope, \(\frac{1}{8}\)-in. diameter, seven strands of seven wires each, 12 in. long, stainless steel Specification A 492, Alloy 316.

5.1.2.5 Sleeve—Swaging, oval, for \(\frac{1}{8}\)-in. diameter wire rope, copper.

5.1.2.6 Lanyard Clip—Flatbar, \(\frac{1}{16}\) in. thick by 1 in. wide by \(1\frac{1}{2}\) in. long, stainless steel, Specification A 167, Alloy 316.

5.1.2.7 Lever Arm—Size to suit, 16-gage material specified by grade.

5.1.3 Type III Materials:

5.1.3.1 Plate—Indicate size, 16 gage, material specified by grade.

5.1.3.2 Single-Acting Quick Release Pin—\(\frac{3}{8}\)-in. nominal size by \(\frac{1}{2}\)-in. grip, stainless steel, Specification A 167, Type 316.

5.1.3.3 Lanyard—Wire rope, \(\frac{1}{8}\)-in. diameter, seven strands of seven wires each, 12 in. long, stainless steel, Specification A 492, Alloy 316.

5.1.3.4 Sleeve—Swaging, oval, for \(\frac{1}{8}\)-in. diameter wire rope, copper.

5.1.3.5 Lanyard Clip—Flatbar, \(\frac{1}{16}\) in. thick by 1 in. wide by \(1\frac{1}{2}\) in. long, stainless steel, Specification A 167, Alloy 316.

5.1.3.6 Lockbar—\(\frac{3}{8}\) in. wide by length to suit by \(\frac{1}{16}\) in. thick, material specified by grade.

5.2 Manufacture:

5.2.1 Edges of the locking device shall be smooth. The devices shall also be free of defects and burrs.

5.2.2 Welds shall be done in accordance with American Welding Society D1.1.

6. General Requirements

6.1 A label plate shall be installed on or near the locking device to instruct the operator on usage.

6.2 When noise reduction is necessary, the contacting parts of the locking device shall have a rubber coating or lining.

6.3 The locking device must be able to lock the valve in both the fully opened and completely closed positions.

6.4 When using Type I, the cable shall be installed sufficiently tight to prevent more than slight movement of the handwheel in a direction opposite of the designed position but not so tight as to place the cable in tension.
6.5 The position of the locking device on the handwheel shall be as to resist movement of the valve stem.

6.6 Type II dimensions shall be used to determine the size of the lever arm, extension on pipe hanger, and the position of the locking holes and slot.

6.7 When specified by the purchaser, a padlock can be used instead of the quick release pin or spring hook.

7. Dimensions and Tolerances

7.1 Dimensions shall be as specified in the figures shown.

7.2 Tolerances are ±\(\frac{1}{16}\) in. except for drilled hole diameter for pin which shall be +\(\frac{1}{32}\) in., −0 in.

8. Keywords

FIG. 5 Type III—Valve Cover Box
Standard Specification for Design and Installation of Overboard Discharge Hull Penetration Connections

This standard is issued under the fixed designation F 994; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers carbon steel overboard discharge hull penetrations for system piping of NPS 1 through NPS 24 (see Note 1).

Note 1—The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as nominal diameter, size, and nominal size.

1.2 The minimum pipe schedule and reinforcement dimensions presented in Tables 1-6 are based on specifications in 46 CFR, 56.50-95 and Navy Design Data Sheet 100-1.

1.3 This specification does not include sea chest penetrations.

1.4 This specification does not include penetrations in protective plating.

A See Fig. 4 and Fig. 5.

3.4.1 Class 1—Sleeves of nonmachined steel tube. Table 4 provides minimum dimensions for nonmachined sleeves.

3.4.2 Class 2—Sleeves of machined steel tube or pipe. Table 5 provides minimum dimensions for machined sleeves.

3.4.3 Class 3—Sleeves of rolled steel flatbar or plate. Table 6 provides minimum dimensions for rolled sleeves.

4. Materials

4.1 Discharge pipe shall be of an acceptable material as specified by Title 46 CFR, 56.60-1.

4.2 Doubler and insert plates shall be of material with physical properties equal to or better than the reinforced shell plate.

4.3 Reinforcing sleeve material shall depend on the penetration pipe size:

5. General Requirements

5.1 Overboard discharges shall be combined to the maximum extent practicable to minimize the number of shell penetrations.

5.2 A minimum of 3 in. shall be maintained between the edge of penetrations and shell plate welding seams. Penetrations shall be located so as to provide sufficient space for...
5.6 Unfavorable flow characteristics may result when small diameter, extreme schedule penetration pipe is used in accordance with Table 1. In this case, minimum allowable schedule penetration pipe, with necessary reinforcement as specified in Tables 2-6, is suggested.

5.7 Penetration pipe extension past the shell plate shall be equal to the pipe wall thickness but not more than 3/8 in.

6. Welding

6.1 Welding shall be in accordance with Figs. 1-6 (see also ANSI B36.10).

6.2 Weld quality shall be in accordance with American Bureau of Shipping standards.

6.3 Fillet welds shall be equal to the penetration pipe wall thickness but not more than 3/8 in.

6.4 Weld quality for military vessels shall be in accordance with MIL-STD-1689.
### 7. Workmanship, Finish, and Appearance

7.1 Surface areas, corners, and discharge pipe ends shall be free of burrs and sharp edges.

### 8. Keywords

8.1 discharge hull penetration; hull penetration; marine technology; penetration connection; ships; system piping

Standard Specification for Centrifugal Pump, Shipboard Use

This standard is issued under the fixed designation F 998; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the requirements applicable to the design and construction of centrifugal pumps for shipboard application. The three classes of service covered by this specification are as follows:

1.1.1 Class 1—Freshwater,
1.1.2 Class 2—Seawater, and
1.1.3 Class 3—Hydrocarbon pumps (less than 1500 SSU).

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are provided for information purposes only.

2. Referenced Documents

2.1 ASTM Standards:

A 36/A 36M Specification for Carbon Structural Steel
A 193/A 193M Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service
A 194/A 194M Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
A 276 Specification for Stainless Steel Bars and Shapes
A 494/A 494M Specification for Castings, Nickel and Nickel Alloy
A 582/A 582M Specification for Free-Machining Stainless Steel Bars
A 747/A 747M Specification for Steel Castings, Stainless, Precipitation Hardening
B 148 Specification for Aluminum-Bronze Sand Castings
B 164 Specification for Nickel-Copper Alloy Rod, Bar, and Wire

B 271 Specification for Copper-Base Alloy Centrifugal Castings
B 369 Specification for Copper-Nickel Alloy Castings
B 505 Specification for Copper-Base Alloy Continuous Castings
B 584 Specification for Copper Alloy Sand Castings for General Applications
F 468 Specification for Nonferrous Bolts, Hex Cap Screws, and Studs for General Use
F 1511 Specification for Mechanical Seals for Shipboard Pump Applications

2.2 ANSI Standards:

B1 ISO Metric Screw Threads (ANSI-B1 Report)
B1.1 Unified Screw Threads
B16.1 Cast Iron Pipe Flanges and Flange Fittings
B16.5 Steel Pipe Flanges, Flanged Valves and Fittings, 150, 300, 400, 600, 900, 1500 and 2500 lb.
B16.11 Forged Steel Fittings, Socket Welding and Threaded
B16.24 Bronze Flanges and Flanged Fittings, 150, 300lb

2.3 Hydraulic Institute Standards:

ANSI/HI 1.1-1.5 American National Standard for Centrifugal Pumps for Nomenclature, Definitions, Applications and Operation
ANSI/HI 1.6 American National Standard for Centrifugal Pump Tests

2.4 AFBMA Standards:

9 Load Ratings and Fatigue Life for Ball Bearings
11 Load Ratings and Fatigue Life for Roller Bearings

2.5 ISO Standards:

ISO 9001 Quality Systems and Quality Assurance—Design/Development, Production, Installation and Service

3. Terminology

3.1 Definitions:

3.1.1 best efficiency point (BEP), n—the capacity and head in which the pump efficiency is the highest.
3.1.2 BHP, $n$—power delivered to the pump from the driver in brake horse power.

3.1.3 capacity, $n$—the total volume output per unit of time.

3.1.4 centrifugal pump, $n$—a kinetic machine converting mechanical energy into hydraulic energy through rotating motion.

3.1.5 close coupled pumps, $n$—in this arrangement, no coupling is provided between the pump and the motor shafts, and the pump housing is flange mounted to the motor. The pump impeller is directly mounted to the motor shaft.

3.1.6 coupled pumps, $n$—in this arrangement, the pump and the motor must use a coupling to transmit the power from the driver to the pump shaft.

3.1.7 gallons per minute (GPM), $n$—U.S. customary unit for capacity.

3.1.8 head, $n$—the expression of the energy content of the liquid referred to in any arbitrary datum. It is expressed in units of energy per unit of weight liquid. The measuring unit for head is foot (metre) of liquid.

3.1.9 head, total discharge, $n$—the sum of the pump’s discharge gauge head, the velocity head at the gauge connection, and the elevation difference between the pump centerline and the gauge centerline.

3.1.10 head, total, $n$—the measurement of energy increase per unit weight of the liquid, imparted to the liquid by the pump, and is the difference between the total discharge head and the total suction head.

3.1.11 head, total suction, $n$—the sum of the pumps suction gauge head, the velocity head at the gauge connection, and the elevation difference between the pump inlet centerline and the gauge centerline.

3.1.12 head, maximum rated, $n$—the most head a pump can generate with the correct impeller diameter for the service conditions.

3.1.13 hydrostatic test, $n$—applying static pressure to the assembled pump or pressure containing components to determine structural integrity of the unit.

3.1.14 maximum allowable working pressure, $n$—the maximum discharge pressure that could occur in the pump when it is operated at the rated speed and suction pressure for a given application.

3.1.15 maximum BHP rated impeller, $n$—the highest power required by a pump with the correct impeller diameter for the service condition.

3.1.16 minimum continuous flow, $n$—the lowest possible flow rate at which the pump can run without generating excessive heat within the unit or damage to the pump.

3.1.17 net positive suction head available (NPSHA), $n$—the total suction head absolute, determined at the first stage impeller datum, less the absolute vapor pressure of the liquid at a specific capacity.

3.1.18 net positive suction head required (NPSHR), $n$—the amount of suction head over vapor pressure required at the pump to prevent more than a 3% loss in total head from the first stage of the pump at a specific capacity.

3.1.19 nonmetallic materials, $n$—any material that would not be recognized as a metal. Examples include plastics, fiberglass resins, carbon fiber, fiberglass-reinforced vinyl ester, polytetrafluoroethylene (PTFE), or any similar material.

3.1.20 non-overloading power characteristics, $n$—this characteristic requires that the driver be sized for the highest possible power requirement from the pump.

3.1.21 OEM, $n$—original equipment manufacturer of the pump unit.

3.1.22 pounds per square inch absolute (PSIA), $n$—the U.S. customary measure of pressure with zero as a true absolute zero in pounds per square inch.

3.1.23 pounds per square inch gauge (PSIG), $n$—the U.S. customary measure of pressure with zero being adjusted to atmospheric pressure in pounds per square inch.

3.1.24 pump efficiency (Eff), $n$—the ratio of the energy imparted to the liquid by the pump to the energy supplied to the pump from the driver.

3.1.25 pump unit, $n$—a typical pump unit consists of a separate pump and driver, combined pump and driver (close coupled), coupling, and coupling guard, and may include a gear box and base plate.

3.1.26 rated point, $n$—applies to the capacity, head, net positive suction head, and speed of the pump as specified by the order.

3.1.27 specific gravity (Sp. Gr.), $n$—the ratio of the density of the liquid to the density of water at 64°F (17.8°C).

3.1.28 vapor pressure, $n$—the pressure exerted when a liquid is in equilibrium with its own vapor. The vapor pressure is a function of the substance and of the temperature.

3.1.29 viscosity, $n$—the resistance of a fluid to shear motion, its internal friction.

4. Ordering Information

4.1 Fig. 1 and Fig. 2 are provided for use by the procuring activity and the OEM. The sections of Fig. 1 and Fig. 2 marked “User Defined,” must be completed by the procuring activity and submitted with the request for bid. This will ensure that the potential bidder provides a pump unit that meets all performance, operational, and reliability requirements of the purchaser. The OEM will fill out all sections of Fig. 1 and Fig. 2 marked “OEM Defined,” and return the data sheet to the purchaser upon delivery of the pump.

4.2 For the convenience of the procuring activity, Fig. 1 and Fig. 2 are provided in both U.S. customary and SI versions.

5. Material

5.1 The materials cited in Table 1 are provided as a guide. Other materials may be substituted as approved by the purchasing activity and as specified in Fig. 1 and Fig. 2.

5.2 When selecting material combinations, the pump supplier shall take into consideration the conditions under which the various materials interact with each other. Material hardness shall be such that any rubbing, sliding, or tight clearance parts shall be selected so that no binding or galling occurs. Special care shall be taken with Class 2 pump materials that interact with each other in a seawater environment.

5.3 Consideration shall be given to the use of nonmetallic (composite) pump components where the use of that material

FIG. 2 Centrifugal Pump Ordering Data (Metric)
can benefit the operation and maintenance of the pump. Purchaser approval must be obtained for the use of nonmetallic materials.

6. General Requirements

6.1 Pumps shall be designed to meet all operational requirements of the intended service and be constructed in such a manner as to allow for reliable operation and maintenance.

6.2 Pumps shall be selected to operate at or near the best efficiency point (BEP) on the head-capacity curve.

6.3 Motors shall have power ratings, including a service factor, if any, at least equal to 125% of pump brake-horsepower at rated design condition for motors less than 30 hp, 115% of pump brake-horsepower at rated design condition for motors rated between 30 and 75 hp and 110% of pump brake-horsepower at pump-rated design condition for motors greater than 75 hp. The power required at pump-rated conditions shall not exceed the motor nameplate horsepower rating.

6.4 Pumps shall be designed for a shipboard environment including both pitch and roll conditions specified by the purchaser in Fig. 1 and Fig. 2. Pumps shall also be capable of sustained operation at the maximum angles of list and trim specified in Fig. 1 and Fig. 2.

6.5 For horizontal pumps, the pump and driver shall be mounted on a common base of sufficient strength and stiffness to allow for proper alignment and operation. Where necessary to maintain proper alignment, dowels or fitted bolts shall be provided.

6.6 All vertical pumps shall be entirely supported by a horizontal foundation or a vertical ship structure, but not both. Where necessary, the upper portion of the pump unit may be bolted to a frame erected on the horizontal foundation.

6.7 Bedplates for Class 3 pumps shall be equipped with driprims and drain connections.

6.8 Horizontal pumps of the coupled type shall be driven through a flexible coupling. Coupled vertical pumps may be connected to their drivers by a flexible or rigid coupling. Couplings between the pump and driver shall be keyed to both shafts.

---

*Materials used for seawater services may also be used for Class 1 and 3 service pumps. Galvanic compatibility must be taken into consideration when choosing allowable materials.

*Material property of composites must be suitable for pump service life and intended service.
6.9 All pump units shall incorporate guards over the couplings, belts, and other external rotating parts. The guards shall prevent personnel contact with the rotating elements. Guards shall be rigid enough to support a 200-lb (88-kg) person.

6.10 Pump and driver seating surfaces of mounting bedplates, bracket mounting plates, or other mounting arrangements shall be machined.

6.11 Sufficient means shall be provided for attaching conventional lifting gear for the installation, removal, and maintenance of both the pump and driver.

6.12 Pumps with face-mounted motors shall be arranged such that there are four possible orientations of the motor to pump.

6.13 Shaft alignment between the pump and driver will be specified by the OEM to allow the pump unit to operate within the vibration limits set in Section 8 over the expected service life of the pump.

6.14 Direction of rotation shall be indicated on the pump by either an arrow cast into the pump casing or by a direction arrow plate permanently attached to the pump.

6.15 The driver type and requirements shall be specified in Fig. 1 and Fig. 2.

7. Pump Design

7.1 Pump inlet and outlet connections shall be flanged in accordance with ANSI B16.1, B16.5, B16.11, or B16.24.

7.2 Pump casings, except for close-coupled pumps, shall be arranged so that the rotating components can be removed without disturbing the driver or the suction and discharge connections.

7.3 The pump casings shall be provided with bosses drilled and tapped or socket welded and flanged for suction, discharge pressure gage, and vent and drain connections if specified in Fig. 1 and Fig. 2 (refer to Fig. 1 and Fig. 2 for type and size). All connections shall be plugged or blank flanged using material suitable for design conditions.

7.4 Coupled pumps shall be equipped with radial and thrust bearings to support the rotor and counteract any unbalanced forces in the pump and ensure that the pump will operate satisfactorily over the pump’s entire design range.

7.5 Close coupled pumps and rigidly coupled vertical pumps shall have radial and thrust bearings located in the driver that are capable of supporting the rotating assembly and counteracting any unbalanced forces in the pump unit.

7.6 Bearings shall be securely fitted by snap rings, shoulders, or other means to prevent axial movement within the bearing housing. Bearing housings shall be integral or bolted to the pump case to maintain internal alignment of components and external alignment between the pump and driver. Bolted connections require fitted bolts, dowels, or rabbot fit to ensure alignment of the bearing housing to the casing.

7.7 Journal and thrust bearings may be of the fluid film or rolling element (antifriction) type. The bearings may be sealed and self- or externally lubricated or may be lubricated by the process fluid.

7.8 Rolling element bearings shall be selected in accordance with AFBMA Standards 9 or 11, or both, and shall have a calculated minimum L10 life of 15 000 h.

7.9 Unless otherwise specified in Fig. 1 and Fig. 2, all pumps shall be equipped with mechanical seals in accordance with Specification F 1511. The installation shall ensure that adequate circulation of liquid at the seal faces occurs to minimize deposits of foreign matter and to provide adequate lubrication of the seal faces.

7.10 Material selection shall be in accordance with Section 5.

7.11 Separate pressure boundary parts such as casing halves, suction heads, and end covers shall be attached to the pump casing using rabbot fits, dowel pins, or fitted bolts to ensure component alignment.

7.12 Screw threads shall conform to ANSI B1.1. Metric screw threads shall conform to ISO Metric Screw Threads (ANSI B1 Report.)

8. Performance Requirements

8.1 The operating conditions of the pump shall be as specified in Fig. 1 and Fig. 2.

8.2 The NPSHR of the pump as determined by the Hydraulic Institute Standards (ANSI/HI 1.1-1.5) shall not exceed the NPSHA that is specified at the rated condition.

8.3 Pumps that handle liquids more viscous than water shall have their water performance corrected in accordance with the Hydraulic Institute Standard (ANSI/HI 1.1-1.5).

8.4 The internally excited vibration levels of the pump unit shall not exceed the requirements of the centrifugal pump test standards of the Hydraulic Institute (ANSI/HI 1.1-1.5).

8.5 The acoustic levels of the pump shall not exceed those specified in Fig. 1 or Fig. 2 when measured in accordance with the centrifugal pump test standards of the Hydraulic Institute (ANSI/HI 9.1-9.5).

8.6 Pressure containing parts shall be capable of withstanding a pressure of at least 1.5 times the maximum allowable design pressure.

9. Painting and Coatings

9.1 Painting—External unmachined and nonmating machined surfaces (except for stainless steel) shall be thoroughly cleaned and painted with a hydrocarbon-resistant, anticorrosive (lead and chromate free) primer and topcoat. Heat-resistant paint requirements, if any, will be specified in Fig. 1 and Fig. 2.

9.2 Painting external surfaces of nonferrous parts and components is not required but is permissible to avoid excessive masking. Identification plates shall not be painted or oversprayed.

10. Equipment Identification Plates

10.1 Identification plates shall be made of a corrosion-resistant material that will last throughout the service life of the pump. The identification plate must be securely attached to each pump.

10.2 The pump identification plate shall contain, at a minimum, the following information:

10.2.1 Manufacturer’s name,
10.2.2 Manufacturer’s model number and size,
10.2.3 Manufacturer’s serial number,
12. Technical Documentation

12.1 Unless otherwise specified, each pump shall include an instruction book that shall be composed of the following:

12.1.1 Unit description;
12.1.2 Installation instructions;
12.1.3 Operating instructions;
12.1.4 Maintenance procedures (including complete pump disassembly and assembly);
12.1.5 Outline dimension drawing, including weight;
12.1.6 Typical cross-sectional assembly drawing and list of materials;
12.1.7 Performance curve that plots total head, efficiency, NPSH, (if required), and brake horsepower as a function of capacity; and
12.1.8 List of fluids with material safety data sheets (MSDS).

12.2 Submittal Documents—Proposal documents shall consist of the following:

12.2.1 Outline dimension drawing with weight and center of gravity;
12.2.2 Typical cross-sectional drawing and list of materials;
12.2.3 Performance curve which plots total head, efficiency, water NPSH, and brake horsepower as a function of capacity; and
12.2.4 List of recommended spare parts.

13. Packaging and Preservation

13.1 All openings shall be sealed with covers. Small piping (1 in. or less) may be sealed with tape. Cover design shall preclude the makeup of connecting piping with covers in place.
13.2 Each unit shall be crated and braced. Small piping shall be secured to prevent damage during shipment.
13.3 Internal surfaces subject to rusting shall be coated with suitable rust preventative.

14. Quality Assurance

14.1 The manufacturer shall have a certified ISO 9001 quality system.

15. Keywords

15.1 bilge and ballast pump; boiler feed pump; centrifugal; centrifugal pump; condensate pump; freshwater pump; hydrocarbon pump; impeller; marine pump; pump; seawater pump
SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the contract or order. When the contract or order invokes a supplement item listed in this section and which may be in conflict with the requirements of Specification F 998, the requirements of the supplement shall prevail. The manufacturer and purchaser shall agree upon details of the supplementary requirements. The manufacturer shall perform the specified tests before shipment of the pump.

S2. Ordering Data

S2.1 Classification—Pumps shall be of the following classes:
S2.1.1 Type C-1—Pumps with overhung impellers with all bearings on the driver side of the impeller.
S2.1.2 Type C-2—Close coupled pumps overhung.
S2.1.3 Type C-2(a)—Reference NAVSEA Drawing 803-5773203 “Pump, Fire, 750 to 1000 GPM.”
S2.1.4 Type C-2(b)—Reference NAVSEA Drawing 803-6962399 “Navy Standard Titanium Close Coupled Pump – 6 × 6 × 15.”
S2.1.5 Type C-2(c)—Reference NAVSEA Drawing 803-6962398 “Navy Standard Titanium Close Coupled Pump – 8 × 6 × 11.”
S2.1.6 Type C-2(d)—Reference NAVSEA Drawing 803-6962399 “Pump, Fire, 250 GPM.”
S2.1.7 Type C-2(e)—Reference NAVSEA Drawing 803-7014778 “Commercial/Marine Composite Standard Pump (5-875 GPM)”
S2.1.8 Type C-3—Pumps with impellers between bearings.
S2.1.9 Type C-3(a)—Reference NAVSEA Drawing 803-6397389 “Pump Centrifugal 2000 GPM.”

S2.2 Requirements—All pumps in accordance with this Supplement shall have Fig. S2.1 completed by the purchasing activity. The pump supplier shall use Fig. 1 of this specification when identifying their pump.

S3. Design Requirements

S3.1 Type C-1 and C-2 Pumps:
S3.1.1 The design shall be of the single-stage, single-suction, and volute type.
S3.1.2 Pumps shall have constantly rising head capacity characteristic curves. Pumps with rated capacities of 50 gal/min or more shall have head capacity characteristic curves such that total head at shutoff is not less than 10 % above the head at rated capacity.
S3.1.3 For pumps with closed impellers, wear rings shall be fitted and shall be secured by means of axially oriented setscrews. Pump out vanes can be used instead of back wear rings when approved by the design agency.
S3.1.4 Pump casing joints shall be made up using compressed sheet gaskets or O-rings.

S3.2 Type C-3 Pumps:
S3.2.1 Pumps shall be capable of parallel operation and shall have constantly rising head characteristic curves. Each pump with a total head gage pressure of 100 psig or more shall have a characteristic curve such that at constant rated speed the total head at shutoff will not be less than 10 % nor more than 20 % above total head at rated capacity.
S3.2.2 The preferred design shall be of the single-stage, double-suction, and volute type. Two stages may be used if necessary to provide an acceptable hydraulic design.
S3.2.3 Removable casing wearing rings shall be fitted in all pumps. They shall be designed for anti-rotation. Leakage through the wearing ring clearance shall not impinge directly on the casing.
S3.2.4 Each Type C-3 pump with a total head gage pressure of 100 psig or higher shall have a synthetic rubber seal between the casing wearing ring and casing. The seal may be an O-ring or flat-face type.
S3.2.5 Pump casing joints shall be made up using compressed sheet gaskets. O-rings may be used when approved by the design review agency.
S3.2.6 Suction and discharge connections of split case pumps shall be on the fixed half casing.

S3.3 Casings:
S3.3.1 Casing thickness shall include a minimum 1⁄8-in. allowance for corrosion and core shift.
S3.3.2 Clearance shall be provided around bolt heads and nuts to permit the use of standard tools.

---

1 Available from Standardization Documents Order Desk, Bldg. 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111–5098, Attn: NPODS
2 Available from NA VSEA-Mechanicsburg, Code 056, 5450 Carlisle Pike, Mechanicsburg, PA 17055.
S3.3.3 Fitted bolts, dowel pins, or rabbets, or combination thereof, shall be provided to ensure alignment of all fitted parts (upper and lower half pump casings, bearing housings to pump casings, and so forth). Dowel pins shall be corrosion resistant and secured against coming adrift under shock loading.

S3.3.4 Forcing (jacking) bolts shall be provided for ease of joint disassembly.

S3.4 Venting—Pump casing shall be self-venting or be provided with casing vents.

S3.5 Impellers:

S3.5.1 Impellers shall be keyed on the shaft and held securely against axial movement by lock nuts. Other means shall be approved by the design review agency.

S3.5.2 Impellers shall not be furnished with wearing rings. Closed impeller hub wearing surfaces shall have sufficient material thickness to permit reducing the diameter of the impeller hubs as much as 0.050 in. to accommodate undersize casing wearing rings to restore design running clearances.

S3.5.3 Each metal impeller shall be dynamically balanced in accordance with ANSI S2.19, Grade G6.3. Use a density of 0.28 lbm/in.³ to calculate the weight of composite impellers for balancing purposes.

S3.6 Shafts:

S3.6.1 There shall be a maximum shaft deflection of 0.002 in. at stuffing box face calculated at shut-off conditions. Use hydraulic radial load calculation from Hydraulic Institute (ANSI/HI 1.1-1.5-1994), Paragraph 1.3.3.7.2. Impeller weight shall be included in radial load calculation for all horizontal pumps. Shaft sleeves shall not be used for determining stiffness of the pump shaft. For overhung impellers, use the inboard bearing as a cantilever fixed point to calculate shaft deflection. Verify deflection at all other close-running clearance locations.

S3.6.2 Screw threads, except for rolling contact bearing locknuts, shall be opposite to the direction of rotation and can be clockwise or counterclockwise.

S3.6.3 Shaft wearing surfaces (local to bushings, water-lubricated bearings and others), shall be fitted with sleeves. O-rings shall be installed between the shaft sleeves and the shaft.

S3.6.4 Shafts of Type C-2 close-coupled pumps shall be of one-piece construction.

S3.7 Rotating Assembly:

S3.7.1 Rotors shall be dynamically balanced with all rotating parts assembled. For common shaft assemblies, or those using rigid coupling, this requires dynamic balance with the rotating element of the driving unit in place. However, rotating
parts may be balanced individually, provided that, when assembled, the imbalance shall not exceed the limits specified in ANSI S2.19 Grade G6.3.

S3.7.2 Where balancing is required as a maintenance procedure to maintain proper vibration or noise performance of the pump and driver unit in service, the pump shall be designed such that balancing may readily be performed.

S3.7.3 The pump shall be designed to operate at a speed not exceeding 70% of the first critical speed.

S3.8 Mechanical Seals:

S3.8.1 Mechanical seals shall be in accordance with S1 of Specification F 1511 except for Type C-2(a), C-2(d), and C-3(a). Split and cartridge seal designs may be used when approved by the design agency.

S3.8.2 Surface ship seawater pumps with a total head of 30 psig or greater shall be fitted with a cyclone separator at each mechanical seal. The separator shall be rigidly mounted on the pump and shall be connected to the suction and discharged piping by means of tubing and fittings. Other means to clean seal flush water, such as a centrifugal force device, can be used when approved by the design review agency.

S3.8.3 Pumps shall be configured so that normal gland leakage from the mechanical seal shall be collected and piped to waste. The collection area shall be tapped for drain connections so that the leakage can be drained away from the pump casing foundation, bearing housings, and driving units.

S3.8.4 A throttle bushing with close clearance shall be used to prevent excessive leakage in case of mechanical seal failure. The diametrical clearance of the throttle bushing bore shall not be more than 0.025 in. for sleeve diameters up to 2.0 in. For larger diameters, the maximum diametrical clearance shall be 0.025 in. plus 0.005 in. for each additional 1.0 in. of diameter or fraction thereof.

S3.8.5 For C-3-type pumps, split mechanical seals shall be incorporated into the pump design. Split mechanical seals (Grade 3 of Specification F 1511) shall not be used for hydrocarbon service pumps.

S3.8.6 Specification F 1511 and Supplement S1 seals shall use an anti-rotation pin with a 1/8-in. diameter and 1/16-in. protrusion for the mechanical seal stationary element.

S3.8.7 The maximum allowable critical tolerancing required: axial shaft movement maximum of 0.003 in., shaft runout maximum of 0.002-in. TIR at impeller fit area and 0.002-in. TIR at seal area (with seal sleeve removed), impeller wear ring runout maximum of 0.004-in. TIR, seal sleeve runout maximum of 0.004-in. TIR, stuffing box face runout of 0.003-in. TIR per inch of shaft diameter (diameter under the seal sleeve), stuffing box bore diameter runout of 0.005-in. TIR (for piloted gland plate), coupling end shaft runout of 0.002-in. TIR.

S3.9 Couplings:

S3.9.1 For horizontal or vertical four-bearing units, a flexible metal coupling shall be installed between the pump and driver. Flexible couplings for pumps for gasoline pumping service or other explosive/flammable liquids shall be nonsparking. Flexible couplings shall be in accordance with MIL-C-23233, Type II, Class 2.

S3.9.2 Coupling hubs shall be keyed to the shaft end. For pump shaft ends 2.5 in. in diameter or larger, the hubs shall be taper fit, keyed, and secured with lock nuts.

S3.10 Bearings:

S3.10.1 Rolling element bearing life shall be calculated for a basic rating L10 h in accordance with ISO 281 (ANSI/ABMA Standard 9) of at least 25,000 h with continuous operation at rated conditions, and at least 16,000 h at maximum radial and axial loads and rated speed.

S3.10.2 For bearing protection, labyrinth or face seals shall be provided adjacent to the gland for all pumps. The wear life of face seals shall be a minimum of 25,000 h. Motors for close-coupled pumps shall have labyrinth or face seals, or both, installed on the inboard bearing housing. Lip seals are not permitted.

S3.11 Materials:

*A Pump/motor hold-down bolts shall be Monel or K-Monel. Carbon steel bolts not permitted because of corrosion.*
S3.11.1 For Type C-2(a), (b), (c), and C-3(a) pumps, all materials shall be in accordance with design drawings. Materials for all other pumps shall be in accordance with Table S3.1. Material classes shown in Table S3.1 shall be followed for all pump components to ensure galvanic compatibility.

S3.11.2 All impellers, wear rings, and shaft sleeves for seawater pumps will use a composite material in accordance with NAVSEA Drawing 803-7226047. Wear rings used in freshwater service pumps shall have a hardness difference then the impeller of at least 50 BHN.

S3.11.3 Proposed alternate materials shall be subject to approval by the design review agency. Components of the pump for which the specific materials are not specified shall use materials best suited for the intended service. Materials, which can be sensitized and subjected to heat treatment in the sensitization range during fabrication, shall not be adversely affected by intergranular corrosion-causing mechanisms. Particular attention shall be given to avoiding sensitization of materials during hard-facing, stress-relieving, or repair-welding operations. Use of cadmium-plated parts, fasteners, and washers is prohibited. Galvanic compatibility between dissimilar metals when used in saltwater applications must be considered.

S3.12 Electric Motors—The pumps shall have non-overloading power characteristics, and the driver-rated horsepower shall at least equal the maximum power requirements of the pump at the rated speed without allowances for a service factor.

S3.13 Hot Freshwater Services (Greater than 200°F condensate/feedwater service):

S3.13.1 NAVSEA detailed review of pump hydraulic test and design data may be used instead of testing at design pump pressures and temperatures.

S3.13.2 Composite internal components are not permitted.

S3.13.3 Vertical pumps shall have mechanical seal chamber vent.

S3.13.4 Single and multi-stage designs are permitted for these services.

S4. Shock and Vibration Testing

S4.1 Shock Test:

S4.1.1 The pump shall undergo a shock test to ascertain that the pump has the necessary shock resistance. The shock test shall be performed in accordance with MIL-S-901, Grade A, and the specific shock test requirements specified in the contract or purchase order. Only one pump of each type, design, and size complete with the driver and all appurtenances and controls shall successfully undergo the shock and vibration qualification at a laboratory or testing facility, which is acceptable to the purchaser. Approvals for shock extensions of similar designs already tested and approved are to be obtained from NAVSEA Philadelphia.

S4.1.2 Before and after shock test, the pump and driver and other components susceptible to internal distortion shall be disassembled to the extent necessary and the critical dimensions and running clearances measured, calculated, and recorded. During this disassembly, the critical components and assemblies subject to shock damage and distortion shall be identified and listed in the inspection record and after completion of the test. The condition of each component and assembly shall be determined and recorded. Shafts, impellers, turbine rotors, motor rotors, and reduction gears shall be inspected by one of the applicable nondestructive test procedures, other than radiography, specified in NAVSEA Technical Publication T9074–AS-GIB-010/271.

S4.1.3 Before and after the shock test, tests in accordance with the Mechanical Soundness and Capacity Test Supplement shall be performed to determine the changes in performance characteristics of the pump. Vibration measurements shall be taken at the bearing caps or housings of the pump and driver at the same speeds during the initial and final capacity test to determine the changes in mechanical operation.

S4.1.4 The unit shall be mounted on the shock machine or barge essentially identical to the actual shipboard installation. The purchasing activity will furnish the contractor a drawing of the shipboard mounting arrangement and foundation’s stiffness. Horizontal pumps, when tested in the inclined position on the medium weight shock machine, shall be oriented so that the direction of shock is perpendicular to the axis of the pump rotation. The pump shall be in operation during the first, third, and fifth blows of the shock test. Pumps with oil lubricated sleeve bearings shall be operated at the minimum speed and pressure required insuring lubrication of bearings and wearing parts. Other pumps shall be operated at the highest rated speed. Pumps shall be operated at as close to the rated condition as possible within the capability of the test facility.

S4.1.5 The pump shall be carefully observed during each shock blow and thoroughly visually examined after each blow. After each blow, the unit shall be operated at as close to maximum rated speed as possible and checked for abnormal noises and vibrations and proper functioning of controls. Turbine driven pumps may be air driven. Tightening of bolts (except for pump/motor hold-down bolts) during shock tests will not be permitted. If any bolt loosens during the test, the equipment manufacturer shall provide a corrective procedure, which must be approved by the purchaser.

S4.1.6 Shock test acceptance criteria shall be as follows:

S4.1.6.1 There shall be no breaking of parts, including mounting bolts.

S4.1.6.2 There shall be no distortion or derangement of any part, which would render the unit incapable of performing as specified.

S4.1.6.3 The amplitude of vibration after test at maximum rated speed shall be less than twice the amplitude measured at the same speed before the test.

S4.1.6.4 Adequate lubrication to all bearings shall be maintained.

S4.1.6.5 Critical dimensions and running clearances shall be maintained.

S4.1.6.6 There shall be no significant change in the head-capacity curve.

S4.1.7 Postshock Test Procedure—The shock-tested unit, if it is to be supplied under a contract or order, shall be restored to the as-new condition by replacement of all parts damaged or distorted beyond the as-new design tolerances. Rolling element bearings shall be replaced regardless of condition. The shock tested rolling contact bearings shall be rendered unusable. The
restored unit shall successfully pass the Hydrostatic Pressure Test Supplement (S5.2.1), the Mechanical Soundness and Capacity Test Supplement (S5.2.4), and the Noise Test Supplement (S5.2.5), if applicable. Quality conformance test documentation shall certify that the unit was subjected to the shock test and subsequently restored, tested, and inspected in accordance with contract requirements. A completed parts examination check list shall be supplied and shall identify the parts which were replaced (such as the bearings) and shall certify that the unit fully conforms to the specifications for unrestricted service.

S4.1.8 Unless otherwise specified by the contract or purchase order, pump units shall be shock tested with its driver. Flexible coupled pumps shock tested with one driver will not be required to be shock tested again when supplied with a different driver of equal or less weight. Drivers are subject to shock tests in accordance with their applicable equipment specifications.

S4.2 Vibration Test:

S4.2.1 The pump shall successfully undergo a vibration test in accordance with the requirements of MIL-STD-167-1, Type I, and as supplemented in the contract or order. The vibration test need not be repeated on subsequent contracts or orders for pumps of identical design to those previously tested, provided the previous tests included the frequencies specified.

S4.2.2 The unit shall be mounted on typical shipboard foundations during the vibration test or the shipboard mounting arrangement shall be simulated in spring mass characteristics except where this mounting arrangement causes the largest test table capacity to be exceeded. Inability to vibration test the unit because of excessive weight or size shall not release the contractor from furnishing equipment which can withstand the specified vibration inputs. Vibration test acceptance criteria shall be in accordance with MIL-STD-167-1, Type I.

S5. Testing Requirements

S5.1 First Article Qualification—One pump of each type, design, and size complete with the driver and all appurtenances and controls shall successfully undergo the specified First Article Qualification at a laboratory or testing facility, which is acceptable to the purchaser. The various first article tests on one pump design may be conducted concurrently, if practical. The tests shall fully establish that the product is reliable and is capable of meeting the specified performance. Design changes which, in the opinion of the purchaser, may adversely affect the applicability of a previously tested and accepted pump design shall be cause to require new design evaluation tests in part or in full. The proposed first article qualification procedures shall be submitted for approval to the purchaser before performing the tests. The design evaluation tests shall consist of the following and are detailed in separate paragraphs: S5.1.1, Performance Test; S5.1.2, Endurance Test; and S5.1.3, Inclined Operation Test. Test reports documenting first article qualification shall be prepared in accordance with accepted engineering practice. The test reports shall document test setup, procedure, significant events, test instruments used including calibration data and accuracy, and measured data. The reports shall be accurate and complete and shall present test results in a professional manner to the purchaser for approval. The report shall include certification of conformance to the specified acceptance criteria that the pump is suitable for its intended application. After approval, test reports shall be distributed as specified in the contract.

S5.1.1 Performance Test:

S5.1.1.1 The performance tests shall be conducted and recorded in accordance with the requirements of the test specified in Mechanical Soundness and Capacity Test Supplement (S5.2.4) except that, in addition, a full-performance map for the rated impeller shall be established. The full-performance map shall be developed by measuring and establishing curves for total head versus capacity, pump efficiency versus capacity, brake horsepower versus capacity, and net positive suction head required versus capacity. For each of those curves, measurements shall be taken at shutoff, rated condition, as close to free delivery as practicable, and at five other capacities approximately evenly spread between these test points. The proposed test procedure for this test shall be submitted to the purchaser for approval approximately at the time of drawing submittal. Test data shall be converted to the specified operating conditions for plotting of all performance curves. The performance curves shall be determined at maximum and minimum operating speed for multispeed pumps. A full net positive suction head (NPSH) curve is required on the lead production unit, and, on subsequent units, the NPSH shall be determined at design rated capacity only.

S5.1.1.2 Acceptance Criteria—The acceptance criteria specified in the Mechanical Soundness and Capacity Test Supplement (S5.2.4) shall be met. The performance map shall exhibit the specified pump performance characteristics. The net positive suction head required shall not exceed the minimum suction head available specified by the contract or order. Controls and safety devices shall function reliably as intended throughout the full operating ranges of capacity and speed.

S5.1.2 Endurance Test:

S5.1.2.1 The pump shall be operated for a period of not less than 500 h of actual running time with a minimum of 60 starts to ascertain reliability of performance and operation. The start/stop cycle requires that the pump be at rest for 5-min minimum before restarting.

S5.1.2.2 Before commencement of the endurance test and immediately after completion of the 500-h operating run, the pump shall be disassembled to the extent necessary and the critical dimensions and running clearance of parts subject to wear, erosion, and derangement shall be measured, calculated, and recorded. Components such as pump impellers and casings subject to erosion, corrosion, cavitation, and wear, the effects of which are not subject to routine measurement, shall be listed in the inspection record and after completion of the test the condition of each component determined and recorded.

S5.1.2.3 During the initial and final hours of the endurance test run, noise, and performance tests (see appropriate paragraphs) shall be performed to determine the changes in pump performance characteristics and noise signature. Vibration measurements shall be taken at the bearing caps or housings of the pump and driver at the same speeds during the initial and final capacity test to determine the changes in mechanical operation.
S5.1.2.4 The endurance test shall not be continuous but shall be interrupted by at least three rest periods of a minimum of 8 h each. The number of starts specified shall be performed at full-line voltage during the course of the test. During an early part of the endurance test, the pump shall be operated continuously for 24 h at a capacity as near free delivery as possible at maximum rated speed and normal specified temperature, submergence, and suction conditions. During the latter part of the endurance test, the pump shall be operated as near shutoff as possible for 12 h continuously. The remainder of the endurance tests shall be run at maximum rated speed and within +20°F, –0°F of maximum specified liquid temperature. The pump shall be operated at one-third, two-thirds, and rated capacity in approximately equal time intervals. Operations at rated capacity shall be at minimum specified net positive suction head available or maximum specified suction lift or vacuum, as applicable.

S5.1.2.5 The pump shall be monitored during the endurance test to record accurately the conditions of operation, the capacity delivered, the total head developed, the speed at which operated, and the general performance observed. Data shall be collected and the pump inspected at least twice per day of operation. For each periodic inspection, in addition to all measured data, the record shall indicate the following:

1. The conditions of the bearings (by audible noise; by feel; and by bearing temperature by means of a probe if the design includes provisions for a probe, otherwise by means of a surface pyrometer on a normally exposed surface; no disassembly required),
2. The airborne noise level (normal-abnormal),
3. The vibration level (normal-abnormal),
4. The smoothness of operation (normal-abnormal),
5. Any other abnormal findings,
6. All adjustments made, and
7. Changes made in the conditions or method of operation.

The Endurance Test acceptance criteria shall be as follows:

1. Head-capacity curve at maximum rated speed after 500 h of pump operation shall conform to the specification requirements and shall show no abnormal deviations from the curve before the 500-h test.
2. Unit performance and operation after 500 h of operation shall be unchanged and normal and meet all specification requirements.
3. Unit operation at the end of the endurance test shall be smooth and shall exhibit noise and vibration levels that are normal and in conformance with the specification. (See 11.6 or MIL-STD-167-1. if S4.2 is invoked.)
4. Lubrication shall have remained satisfactory throughout the test period. Bearing temperatures shall have remained normal and shall be consistent with their respective bearing clearances and oil and grease limitations.
5. Leakage rate from a mechanical shaft seal or pump packing shall have performed as specified. The leakage shall be of a quantity such that it can drain from the pump cavity without overflowing.
6. Running clearances shall be normal.

S5.1.2.6 Postendurance Test Procedures—The unit subjected to the 500-h test, if it is to be supplied under an order or contract, shall be restored to the as-new condition by replacement of all parts worn beyond the as-new design tolerances. The restored unit shall successfully pass the Hydrostatic Pressure Test Supplement, Mechanical Soundness, and Capacity Test Supplement, (S5.2.4.1 (1)), and Noise Tests Supplement (S5.2.5), if applicable. The quality conformance test documentation shall indicate that the unit was subjected to the endurance test and subsequently restored and tested, and that it shall be certified as fully conforming to the specification for unrestricted service.

S5.1.3 Inclined Operation Test—This test shall only be required for pumps with oil lubricated bearings and as a check for oil leakage while inclined at an angle from the normal equal to the combination of the maximum permanent list and trim as specified in the contract or purchase order. Operation in the inclined position shall be as close to rated speed and capacity as practicable. The performance point shall be indicated in the test report.

S5.2 Production Tests—The purchasing activity or its representatives, or both, shall have the right to examine the facilities at the manufacturer’s plant and at his subcontractor’s plants and to witness all tests specified in the contract to the extent specified in the ordering data. Failures, deficiencies, and discrepancies revealed during the performance of the specified tests and the corrective measures taken should be recorded and fully documented in the applicable test records and test reports. After correction of any deficiency, tests shall be repeated to the full extent necessary to determine acceptability for the modified pump. Failures indicative of a design deficiency (as distinguished from shop error or faulty workmanship) shall be reported to the purchaser before a correction is made.

S5.2.1 Hydrostatic Pressure Test—All pressure boundary parts, excluding the mechanical seal, shall be tested hydrostatically to a pressure one and one half times the maximum design working pressure at maximum submergence, but in no case less than 50 psig. The hydrostatic test pressure shall be maintained for at least 30 min or longer as necessary for examination of entire casing.

S5.2.1.1 Acceptance Criteria—The pump shall exhibit no leakage through the pressure boundary material or joints.

S5.2.2 Assembled Pump Pressure Test—The assembled pump shall be tested at a pressure equal to or greater than the sum of the shutoff pressure plus the design suction pressure.

S5.2.2.1 Acceptance Criteria—The pump shall exhibit no leakage from the joint and the pressure boundary. Leakage from the mechanical seal shall be in accordance with Specification F 1511.
S5.2.3 Overspeed Test—Each pump driven by a variable speed driver that can overspeed shall be operated continuously for 30 min at a speed of 25% above maximum design operating speed. The pump need not be under load except as necessary to prevent damage or injury. Continuous shaft and rigid coupled pumps shall be tested with the driver. Units separately driven through flexible couplings and geared units may be tested using a different driver capable of reaching the overspeed condition. The dynamic balance shall be checked using a vibration instrument capable of measuring vibration amplitude of 0.001 in. (peak to peak). Neither the pump nor driver shall exhibit abnormal noises or roughness of operation. Vibration shall not exceed the vibration limits for this equipment in accordance with 11.6 (or MIL-STD-167-1, Type II if S4.2 is invoked).

S5.2.4 Mechanical Soundness and Capacity Test

S5.2.4.1 This test shall be conducted, recorded, and reported in accordance with the Centrifugal Pump Rating Standard and Test Code of the Hydraulic Institute, to the extent that these standards are applicable and are not in conflict with the contract requirements. The test record for each pump shall include the following as a minimum:

(1) Certification of the major pump components (pump, gear assembly, driver) by the manufacturer’s drawing number and serial number that were tested;

(2) Identification of the diameter of the impellers tested in the pump;

(3) A dimensioned sketch of the test loop showing location of the pump, location of all instrumentation, distance (vertical and along the pipe axis) from the suction and discharge gage taps to the pump suction and discharge flanges, vertical distance from the gage(s) to the elevation datum to which they are calibrated, azimuthal location of the gage taps on the pipe circumference, and location and orientation of any elbows in the pump suction piping;

(4) The test loop water temperature during the test;

(5) A list of the test instruments including date of last calibration, advertised accuracy, size, (for example, 0.25 lb/ in.²) of the smallest graduation on the readout scale, range of the readout scale (for example, from 0 to 100 lb/in.²), and unit (for example, lb/in.²) of measurement including the water temperature the gages are calibrated for if a gage is calibrated in feet of water rather than in lb/in.²;

(6) The data sheets of all recorded data, with the unit of measurement identified for all data;

(7) A sample calculation of each type of calculation converting the raw data into specified conditions and showing the conversion in sufficient detail to permit an independent reviewer to verify the calculations, including all temperature and density corrections;

(8) A copy of the specific table of water properties used in the calculations and a reference to the source of that table; and

(9) A plot of the measured head-capacity curve, corrected to the specified operating conditions following the method described in the sample calculations.

S5.2.4.2 The test shall be performed as follows:

(1) Operate the pump and its driver, if motor driven continuously at the rated speed and capacity, with the pumped fluid at ambient temperature until bearing temperatures (not including water-lubricated bearings) stabilize. Stabilization is defined as three consecutively recorded readings taken over intervals of at least 15 min that fall within 3°F band when adjusted for ambient. The three consecutive readings shall not be constantly rising. The pump operation shall be monitored for proper functioning of safety devices, bearing lubrication, and for smooth running.

(a) Acceptance Criteria—Unit operation shall be free of abnormal vibrations and noises. Oil temperature rise in force-feed lubricated bearings shall not exceed 50°F with inlet cooling water to the oil cooler at 85°F. Controls and attached instruments shall function as specified and are in calibration. There shall be no abnormal leakage of water or oil.

(2) Operate the pump at the maximum rated speed with the pumped fluid at maximum normal temperature from recirculation flow to 130% of the rated capacity specified and with the minimum specified suction pressure. The unit shall be operated at shutoff rated condition, 130% of rated capacity and at five other capacities approximately evenly spaced between these points. The unit shall be operated at each test point until the test values being measured stabilize.

(a) Acceptance Criteria—The pump shall deliver the rated capacity, head and efficiency. The head-capacity characteristic curve at maximum rated speed shall satisfy the specified requirements. The total head at all capacities from 0 to 120% of rated capacity on the curve shall not deviate by more than ±5% or –5% of rated head at the corresponding capacity on the head-capacity characteristic curve at maximum rated speed established during initial design testing of the pump. If more than one performance test has been performed for a given pump design for use in a given ship class, then an average of all performance head-capacity characteristic curves established is the one to which the preceding sentence refers. In no case shall the pump deliver less than the rated head at rated flow. The required net positive suction head shall not exceed the minimum net positive suction head available as specified in the contract.

(3) Operate the electric motor-driven unit for a minimum of 1 min in reverse rotation at maximum rated speed.

(a) Acceptance Criteria—The unit shall not be damaged by the reverse rotation test.

S5.2.5 Noise Tests—Airborne and structure-borne noise tests when specified shall be conducted and reported in accordance with MIL-STD-740. Noise test details, instrumentation, and testing techniques identified in MIL-STD-740 shall be submitted to the purchaser before testing for approval. Noise tests shall be performed with the driver furnished with pump, and tests shall be conducted on all units.

S5.2.5.1 Acceptance Criteria—The unit shall meet the noise level limits specified in the contract.
Standard Specification for
Searchlights on Motor Lifeboats

1. Scope

1.1 This specification covers searchlights for motor lifeboats.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following precautionary caveat pertains only to the test method portion, Section 7, of this specification: This standard does not purport to address all of the safety concerns associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
   B 117 Practice for Operating Salt Spray (Fog) Apparatus

2.2 Military Standard:
   MIL-STD-105D Sampling Procedures and Tables for Inspection by Attributes

3. Descriptions of Terms Specific to This Standard

3.1 lot—a manufacturer’s production run for a specific type of searchlight.

3.2 order batch—size of a specific contract or purchase order taken from the lot.

3.3 production testing—testing performed during a lot run of specific searchlights.

4. Materials and Manufacture

4.1 Material:

4.1.1 All materials used in the construction of these searchlights shall be of a quality suitable for the purpose intended and shall conform to the requirements of this specification.

4.1.2 The searchlight shall be constructed of brass, copper-alloy, an equivalent corrosion-resistant material, or a material that when tested in accordance with Practice B 117 for 200 h, does not show signs of pitting, cracking, or deterioration.

4.1.3 Plastic, when used, shall be of a suitable thermoplastic or thermosetting material so molded as to produce a dense solid structure, uniform in texture, finish, and mechanical properties.

5. Requirements

5.1 The height of the searchlight from the base to the top of the light shall not exceed 19 in. (483 mm).

5.2 The housing of the searchlight shall be capable of free movement of at least 60° above and 45° below the horizontal, and be able to rotate 360° in the horizontal plane. There shall be a means provided to lock the searchlight in any desired position without the use of tools (vertically and horizontally).

5.3 The searchlight shall be capable of illuminating a light colored object at night at 55 ft (180 m). The searchlight shall project a beam of light of not less than 5.5 ft (18 m) in diameter at a distance of 55 ft from the light source. The edge of the beam shall be a point where the intensity of the light is 10% of the maximum intensity. The light source shall have a candlepower rating of no less than 350 000 cd.

5.4 The searchlight shall be capable of being operated for not less than 3 h of continuous use and 6 h of intermittent use.

5.5 The lamp used in the searchlight shall be of the incandescent, quartz, or other type which would allow for instant start. The lamps shall be rated for 12 V.

5.6 Each searchlight shall be watertight. The searchlight shall show no leakage of water following the test method prescribed in 7.1.

5.7 Each searchlight shall be wired with a 6-ft (2-m) length of rubber jacketed hard service flexible cord, unless otherwise specified in 8.3. The conductor size shall be no less than 16 AWG. The cable entry into the searchlight shall be sealed with a watertight bushing and packing gland. A suitable clamping device shall be installed in the area where the cables enter the gland to prevent any force being exerted on the gland or connections. The free end of this cord shall be dead-ended unless otherwise specified in 8.3.
5.8 Each searchlight shall be provided with a handle or handgrip to allow for ease of maneuvering the light into various positions.

6. Workmanship, Finish, and Appearance

6.1 Searchlights shall be of sturdy construction, and free from mechanical, electrical, or other imperfections or defects which materially affect appearance or which may affect quality, reliability, or serviceability.

6.2 The finished searchlight shall not contain rough edges, burrs, or other disfigurements and shall be clean, free from rust, tool marks, and other injurious defects.

7. Test Methods

7.1 Watertightness—The searchlight shall be submerged in a saltwater solution (1.04 sp gr) to a depth of 3 ft (0.9 m) of 60°F (16°C) for 2 h. The light will then be subjected to the tests of 7.2.1 and be in perfect working order.

7.2 Environmental:

7.2.1 Operational Test—The searchlight shall be operated continuously for 3 h at rated voltage in an ambient temperature of 77°F (25°C) and be operational after being subjected to the watertightness test of 7.1. The searchlight shall then be operated intermittently. The intermittent time periods shall be 15 min “ON” and 5 min “OFF” for a total 6-h period. These tests shall be repeated three times.

7.2.2 Impact:

7.2.2.1 Test Conditions—The searchlight shall be placed in a cold chamber at −40 ± 5°F (−40 ± 3°C) for 2 h. With the searchlight stabilized at this temperature, it shall be immediately subjected to the low- and high-impact tests specified in 7.2.2.2 and 7.2.2.3. The point of impact shall be applied to the outside of the case at a point midway between the ends of the case at 4 points 90° apart and the back plate.

7.2.2.2 Low Impact—The searchlight shall be subjected to a 12 in.-lb (1.3 J) impact using a 1-lb (0.5-kg) steel ball at each of the points of impact specified in 7.2.2.1. The searchlight shall then be subjected to the watertightness test (see 7.1). There shall be no evidence of breakage from impact and no evidence of moisture shall be found in the case.

7.2.2.3 High Impact—The searchlight, after passing the low-impact test, shall be again placed in the cold chamber at −40 ± 5°F (−40 ± 3°C) for 2 h and then immediately subjected to a 20 in.-lbf (2.3 J) impact using a 1-lb (0.5-kg) steel ball at each of the points of impact specified in 7.2.2.1. There shall be no evidence of damage to the case or the lens.

7.3 Test for Light Projection—The beam spread of the searchlight shall be shown to meet the calculations contained in the IES Lighting Handbook.2 This test shall be conducted at rated voltage.

---

2 IES Lighting Handbook (Vol 1, Section 20), is available from Illuminating Engineering Society of North America, 120 Wall St., New York, NY 10005.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Practice for
HVAC Duct Shapes; Identification and Description of Design Configuration

This standard is issued under the fixed designation F 1005; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the identification of design configurations and descriptive nomenclature for sheetmetal HVAC ductwork shapes frequently used in shipbuilding. This practice also covers parametric dimensions of these shapes. (See Table 1.)

1.2 This practice does not cover the location of seams or joints within a shape or the method of joining shapes together.

1.3 Since this practice is not measurement sensitive, it is applicable whether inch-pound or SI metric dimensions are used.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Terminology

2.1 Definitions of Terms Specific to This Standard:

2.1.1 branch—portion of a duct system connection to a main duct.

2.1.2 elbow—a fitting used to change direction of air flow.

2.1.3 flat oval—cross section that has flat sides and semi-circular ends.

2.1.4 long axis of flat oval curved so that the flat sides of the flat oval remain in a plane.

2.1.5 offset—fitting that changes the location of the duct with the line of the duct remaining parallel.

2.1.6 ogee—a smoothly curved type of offset. The inside curve of each end is tangent to the outside curve of the other end.

2.1.7 radius corner—cross section that is generally rectangular, but with the corners softened to a radius.

2.1.8 rectangular—rectangular or square cross section.

2.1.9 reducer—a fitting that changes the size but not the cross-section type of duct.

2.1.10 round—circular cross section.

2.1.11 short axis of flat oval—curved so that the flat sides of the flat oval correspond to the curve.

2.1.12 splitter—internal part of some elbows and offsets; sometimes required in diverging transitions. Used to provide more uniform velocity and distribution of air flow. The number and location of splitters is determined by calculation or from a nomograph.

2.1.13 straight—duct that remains constant in cross section and size throughout its length.

2.1.14 throat—wrapper around the inside of a fitting.

2.1.15 transition—fitting that changes the cross-section type of the duct.

2.1.16 vane—internal part of vaned turns. Used to provide more uniform velocity of air flow. Configuration, number, and location of vanes is determined from drawing, NAVSHIPS No. S3801-385260. The direction of airflow must be marked on vaned turns.

2.1.17 vaned turn—a fitting containing vanes that is used to change the direction of air flow.

2.2 Variables Specific to This Standard:

A—Angle. Included angle of an elbow, branch, vaned turn, or slant-top fitting.

AF—Air In indicates the length of the straight portion of a vaned turn in the “air in-flow” side.

AO—Air Out indicates the length of the straight portion of a vaned turn on the “air out-flow” side.

B—Distance from the intersection of the center lines of a branch and the main duct to the end of the main duct.

CY—Distance between centers of a Y branch.

D—Depth of a part.

DB—Depth of a branch.

DIA—Diameter of a part.

DIAB—Diameter of a branch.

DIA1—Major diameter of a part.

DIA2—Minor diameter of a part.

DI—Major depth of a part.

D2—Minor depth of a part.

F—Flat section that softens the corner of a vaned turn.

This practice is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery.

TABLE 1 HVAC Standard Nomenclature and Numbering System

1. Straight:
   1.1 Straight-round
   1.2 Straight-flat oval
   1.3 Straight-rectangular

2. Offset:
   2.1 Offset-round
   2.1.1 Offset-flat oval-long axis
   2.2 Offset-flat oval-short axis
   2.3 Offset-rectangular-without splitters
   2.3.1 Offset-rectangular-with splitters
   2.4 Offset-ogee-without splitters
   2.4.1 Offset-ogee-with splitters
   2.5 Offset-rectangular-reducing-without splitters
   2.5.2 Offset-rectangular-reducing-with splitters

3. Elbow:
   3.1 Elbow-round
   3.2 Elbow-flat oval-long axis
   3.2.1 Elbow-flat oval-short axis
   3.3 Elbow-rectangular-without splitters
   3.3.1 Elbow-rectangular-with splitters
   3.4 Elbow-rectangular-reducing-without splitters
   3.4.2 Elbow-rectangular-reducing-with splitters
   3.5 Elbow-rectangular-transition-without splitters
   3.5.2 Elbow-rectangular-transition-with splitters

4. Vaned Turn:
   4.1 Vaned turn

5. Reducer:
   5.1 Reducer-round
   5.2 Reducer-flat oval
   5.3 Reducer-rectangular

6. Transition and Bellmouth:
   6.1 Transition-flat oval to round
   6.2 Transition-rectangular to round
   6.3 Transition-rectangular to flat oval
   6.4 Transition-rectangular to radius corner
   6.5 Transition-radius corner to flat oval
   6.6.1 Bellmouth-round
   6.6.2 Bellmouth-rectangular

7. Branch:
   7.1.1 Branch-round-on equal diameter round
   7.1.2 Branch-round-on larger diameter round
   7.1.3 Branch-round-on round reducer
   7.1.4 Branch-round-on rectangular straight
   7.1.5 Branch-round-on rectangular reducer
   7.1.6 Branch-round “Y”
   7.1.7 Branch-rectangular to round-“Y”
   7.2.1 Branch-rectangular-on rectangular straight
   7.2.2 Branch-rectangular-on rectangular reducer

---

$L$—Length of a part.
$LB$—Length of a branch from the end of the branch to the point where the centerline of the branch intersects the centerline of the main duct.
1.1—Major length of a Y branch.
1.2—Minor length of a Y branch.
$O$—Offset in one direction.
$R$—Radius of a bellmouth.
$RC$—Radius corner.
$RV1$—Radius of first splitter at V extension.
$RV2$—Radius of second splitter at V extension.
$RV3$—Radius of third splitter at V extension.
$RZ1$—Radius of first splitter at Z extension.
$RZ2$—Radius of second splitter at Z extension.
$RZ3$—Radius of third splitter at Z extension.
$RI$—Radius of first splitter.
$R2$—Radius of second splitter.
$R3$—Radius of third splitter.
$S1$—Distance of first splitter from the outside curve of an ogee offset.
$S2$—Distance of second splitter from the outside curve of an ogee offset.
$S3$—Distance of third splitter from the outside curve of an ogee offset.
$TR$—Throat radius is the radius of the inside surface of an elbow or offset. Normally TR is equal to the width (of a rectangular elbow).
$TR1$—Major throat radius of a reducing offset.
$TR2$—Minor throat radius of a reducing offset.
$V$—Extension on one end of a part, opposite from Z.
$W$—Width of a part.
$WB$—Width of a branch.
3. Significance and Use

3.1 Standard nomenclature shall be used to facilitate communication between designers, suppliers, and users of HVAC ventilation ductwork components.

3.2 Standard design parameters shall be used to define ventilation ductwork shapes.

3.3 Standard variables for design parameters (see 2.2) are useful in writing CAD/CAM software for automatic fabrication of ventilation ductwork shapes.

4. Description of HVAC Standard Shapes

4.1 The HVAC standard shapes covered by this practice are described by Figs. 1-41. The shapes have been divided into seven categories by function.

4.1.1 HVAC Duct Categories:

4.1.1.1 Straight.

4.1.1.2 Offset.

4.1.1.3 Elbow.

4.1.1.4 Vaned turn.

4.1.1.5 Reducer.

4.1.1.6 Transition and bellmouth.

4.1.1.7 Branch.

4.1.2 Each sketch is identified by the standard name and indicates the design parameters needed for fabrication.

4.2 The HVAC standard shapes are also identified by number for convenient reference. A modified decimal numbering system is used for this purpose.

4.2.1 Primary Number—The primary numbers 1 through 7 correspond to the seven categories of shapes.

4.2.2 Secondary Number—The secondary number designates a predominant characteristic, such as cross section that differentiates a shape from other shapes in the category.

4.2.3 Ternary Number—The ternary number, when required, is used when further differentiation is required. A summary of this system is presented in Table 1.

5. Keywords

5.1 air conditioning; heating; HVAC duct configuration; HVAC ducts; HVAC duct shapes; ventilation
FIG. 3  Shape 1.3—Straight-Rectangular

FIG. 4  Shape 2.1—Offset-Round

Standard Specification for
Entrainment Separators for Use in Marine Piping
Applications

This standard is issued under the fixed designation F 1006; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the minimum requirements for
the pressure-temperature rating, testing, and making of
pressure-containing vessels for entrainment separators.

1.2 The values stated in inch-pound units are to be regarded
as the standard. The values given in parentheses are for
information only.

1.3 The following safety hazards caveat pertains only to the
test methods portion, Section 6, of this specification: This
standard does not purport to address all of the safety concerns,
if any, associated with its use. It is the responsibility of the user
of this standard to establish appropriate safety and health
practices and determine the applicability of regulatory limita-
tions prior to use.

2. Referenced Documents

2.1 ANSI Standards:
B2.1 Pipe Threads (Except Dryseal)
B16.1 Cast Iron Pipe Flanges and Flanged Fittings
B16.3 Malleable Iron Threaded Fittings, Class 150 and 300
B16.4 Cast Iron Threaded Fittings, Class 125 and 250
B16.5 Steel Pipe Flanges and Flanged Fittings
B16.11 Forged Steel Fittings, Socket Welding and Threaded
B16.15 Cast Bronze Threaded Fittings, Class 150 and 300
B16.24 Bronze Flanges and Flanged Fittings, Class 150 and
300
B16.25 Buttwelding Ends
B16.31 Nonferrous Pipe Flanges

2.2 ASME Standards:
SA278 Cast Gray Iron Pressure Vessels
SA395-60 Cast Ductile Iron
Boiler and Pressure Vessel Code, Section VIII
Boiler and Pressure Vessel Code, Section II

3. Definitions of Terms Specific to This Standard

3.1 entrainment separator—a mechanical device inserted in
a pipeline which by centrifugal force, baffles, or other means
will separate a liquid from a gas (vapor).

3.2 hydrostatic test—the act of filling an entrainment sepa-
rat or vessel with water and applying internal pressure to all
parts of the vessel.

3.3 master gage—the calibrated gage used to verify the
accuracy of the test gage. This gage shall be recalibrated
traceable to the National Bureau of Standards.

3.4 pressure rating—the maximum working pressure of an
entrainment separator when operated at a specific temperature.

3.5 proof test—the act of filling an entrainment separator
vessel with water and applying internal pressure to all parts of
the vessel for the purpose of causing yielding of the vessel and
bursting of the vessel.

3.6 temperature ratings—minimum and maximum tem-
peratures at which the entrainment separator may be operated
while at specific pressures.

3.7 test gage—the pressure gage that is used to check the
internal pressure of the entrainment separator. The test gage
shall be calibrated at least annually or at any time it is
suspected to be in error by a calibrated master gage.

4. Materials and Manufacture

4.1 The pressure-temperature ratings established under this
specification are based upon the manufacturer’s usage of high
quality materials produced under regular control of chemical
and physical properties by a recognized process. The manu-
ufacturer shall be prepared to submit certification of compliance,
verifying that his product has been so produced and that it has been manufactured from material with chemical and physical properties at least equal to the requirements of the appropriate standard or specification listed in 4.3 of this specification or Section II of the ASME Boiler and Pressure Vessel Code.

5.2 The design pressure-temperature of entrainment separators covered in this specification will be established by the manufacturer using one of the following methods:

5.2.1 Design calculations in accordance with the requirements prescribed in the ASME Boiler and Pressure Vessel Code, Division VIII, Section VIII, Division 1, Part UG of Subsection A and the applicable part of Subsection C.

5.2.2 Proof test in accordance with the requirements of UG 101 (m), UCI-101, or UCD-101 of Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

5.2.3 Where any part of the entrainment separator vessel cannot be designed within the scope of the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

5.2.3.1 The hydrostatic test pressure shall be applied gradually to the entrainment separator and held stationary at each increment for a sufficient time in order that a visual inspection can be made for leaks or deformation of the vessel. The final value of hydrostatic test pressure that is not in conflict with 5.2.3.2 is called \( P_{HT} \).

6. Test Methods

6.1 All entrainment separators must be pressure tested in accordance with the following:

6.1.1 Each entrainment separator shall be tested by subjecting it to an internal hydrostatic test procedure, which at every point in the separator is at least equal to 1.5 times the maximum allowable working pressure, multiplied by the lowest ratio of the stress value for the design temperature.

\[
P = \frac{P_{HT}}{4} \times \left( \frac{S_1}{S_2} \right) \quad \text{(for steel vessels)}
\]

\[
P = \frac{P_{HT}}{4} \times \left( \frac{T_1}{T_2} \right) \quad \text{(for cast iron vessels)}
\]

where:

- \( P \) = maximum allowable working pressure (psig) at design temperature,
- \( P_{HT} \) = hydrostatic test pressure (psig) at test temperature,
- \( S_1 \) = stress value at design temperature (psi),
- \( S_2 \) = stress value at test temperature (psi),
- \( T_1 \) = specified minimum tensile strength (psi), and
- \( T_2 \) = actual tensile strength test specimen (psi).

5.2.3.1 Stress values \( S_1 \) and \( S_2 \) are determined from Section VIII, of the ASME Boiler and Pressure Vessel Code.

5.2.3.2 The value of \( P_{HT} \) to be used in determining the maximum allowable working pressure shall be the maximum pressure to which the entrainment separator was subjected to without permanent deformation or rupture.

5.2.3.3 Test water temperature\(^6\) and entrainment separator temperature must be at equilibrium before hydrostatic test pressure is applied.

5.2.3.4 All possible air pockets must be purged while the entrainment separator vessel is being filled with water. Adequate vents shall be provided at all high points of the vessel.

5.2.3.5 External equipment not to be pressurized with the entrainment separator should be isolated or disconnected before applying the hydrostatic test pressure.

5.2.3.6 Hydrostatic test pressure shall be applied gradually to the entrainment separator and held stationary at each increment for a sufficient time in order that a visual inspection can be made for leaks or deformation of the vessel. The final value of hydrostatic test pressure that is not in conflict with 5.2.3.2 is called \( P_{HT} \).

6.1.1.1 The hydrostatic test pressure shall be held stationary for a suitable time necessary for observation and inspection of the separator. The minimum time of test shall be no less than 1 min.

6.1.1.2 A test gage, as defined in this specification (see Section 3) shall be connected directly to the entrainment separator.

6.1.1.3 For compliance with ASME Codes leading to ASME certification, proceed with steps as outlined in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code for Standard Hydrostatic Tests.

7. Packaging and Package Marking

7.1 Each entrainment separator shall have a securely attached nameplate or other permanent marking indicating the following:

7.1.1 Manufacturer’s name and trademark,
7.1.2 Pressure-temperature rating,

\(^6\) Test water temperature to be no less than 60°F (10°C), but not to exceed 125°F (52°C).
7.1.3 Manufacturer’s serial number,  
7.1.4 Year built,  
7.1.5 Size (end connection pipe size),  
7.1.6 Flow direction,  
7.1.7 National board number, where applicable,  
7.1.8 ASME code stamp, where applicable, and  
7.1.9 ASTM designation and year of issue.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

Standard Specification for Pipeline Expansion Joints of the Packed Slip Type for Marine Application

1. Scope

1.1 This specification covers the design, manufacturing, and testing of packed slip-type expansion joints used in pipelines for accommodating axial thermal growth or contraction from the pipeline carrying fluid.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:

A 53/A 53M Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

A 216/A 216M Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service

B 650 Specification for Electrodeposited Engineering Chromium Coatings on Ferrous Substrates

2.2 ANSI Standards:

B16.5 Steel Pipe Flanges and Flanged Fittings

B16.25 Buttwelding Ends

2.3 ASME Standards:

Section V Nondestructive Examination

Section VIII, Division 1 Pressure Vessels

Section IX Welding and Brazing Qualifications

2.4 AISI Standard:

C-1018 Carbon Steel

3. Classification

3.1 The expansion joints shall be of the following types, styles, classes, and forms:

3.1.1 Type I—Injectable semiplastic packing type, designed for injecting packing under full-line pressure.

3.1.2 Style I—Internally externally guided with guides integral with stuffing box.

3.1.3 Style II—Internally externally guided with guides integral with stuffing box and with low-friction inserts at the guide surfaces.

3.1.4 Class I—Single joint, single slip.

3.1.5 Class II—Double joint, double slip.

3.1.6 Form I—Weld end.

3.1.7 Form II—Flanged end.

3.1.8 Form III—Other.

4. Ordering Information

4.1 Expansion joints shall meet all the requirements of the latest issue of this specification. Where possible, the expansion joint shall be the manufacturer’s standard commercial product. Additional or superior features that are not prohibited by this specification but which are a part of the manufacturer’s standard product, shall be included with the expansion joint being offered. A standard commercial product is a product that has been sold or is currently being offered for sale on the commercial market through advertisements or manufacturer’s catalogs, or brochures, and represents the latest production model.

4.2 Purchase order or inquiry for expansion joints to this specification shall specify the following:

4.2.1 Title, number, and latest revision of this specification.

4.2.2 Style, class, and form required.

4.2.3 Materials, other than standard as specified (see Section 8).

4.2.4 Service conditions shall specify the following:

4.2.4.1 Maximum and minimum operating temperature (°F).

---

Notes:

1 This specification is under the jurisdiction of Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

2 Annual Book of ASTM Standards, Vol. 01.01.

4 Annual Book of ASTM Standards, Vol. 01.04.

5 Annual Book of ASTM Standards, Vol. 02.05.

7 Available from American Society of Mechanical Engineers (ASME), ASME International Headquarters, Three Park Ave., New York, NY 10016-5990.

8 Available from American Iron and Steel Institute (AISI), 1101 17th St., NW, Suite 1300, Washington, DC 20036.
4.2.4.2 Maximum operating pressure (psig).
4.2.4.3 Fluid handled.
4.2.4.4 Corrosive conditions, if applicable.
4.2.5 Total axial expansion or contraction.
4.2.6 ANSI pressure class, facing, and drilling for flanged end joint and pipe schedule or wall thickness of ends for weld end joint.
4.2.7 If base is required for support or main anchor on Class I expansion joint.
4.2.8 Drain connection, if required.
4.2.9 Service connection if required, noting location and type of connection.
4.2.10 Slip protectors, if required.
4.2.11 Adjustment rods for field extension or compression of the slip if required.
4.2.12 If hot-dip galvanizing of parts is required.
4.2.13 Spare parts, accessories, and special tools, if required.
4.2.14 Hydrostatic testing and test pressure, if required.
4.2.15 Radiographic or other nondestructive testing of weld joints if required.

5. Materials and Manufacture

5.1 Materials:
5.1.1 Materials of construction shall conform to the requirements as specified in this specification (see Section 8) and shall be new and free from defects that would adversely affect the performance of individual components or assemblies.
5.1.2 As specified in this specification and as required, the expansion joint shall be provided with flanged or welded end connections, limit stops, stuffing boxes with integral guides, base, drain connection, service connection, slip protectors, and adjustment rods.

5.2 Manufacture:
5.2.1 General—Unless otherwise required by this specification, the manufacturer’s standard shop practices for the fabrication of the expansion joint are acceptable, provided these practices conform to the requirements and recommendations of this specification.
5.2.2 All Welding—Welding procedure qualifications, welder performance qualification, welding materials, preheat, and postweld heat treatment if required, shall be in accordance with ANSI B31.1 and ASME Code Section IX.
5.2.3 Identification—Each completed expansion joint shall have a name plate made from a corrosion-resistant material permanently attached showing as a minimum the following:
5.2.3.1 Manufacturer’s model number and joint size,
5.2.3.2 Design pressure and design temperature range,
5.2.3.3 Nominal traverse or movement per slip,
5.2.3.4 Type of packing and service fluid, and
5.2.3.5 Date of manufacture.

6. Joint Descriptions

6.1 Styles:
6.1.1 Style I—The slip of the expansion joint shall be guided with the body of the expansion joint by internal and external guides that are integral with the stuffing box. Semiplastic packing shall be injected into the stuffing box and may be contained within the stuffing box chamber by ring-type pack-

ing. All packing shall be of the self-lubricating type. The expansion joint and semiplastic packing shall be suitable for the safe injection of the packing under full-line pressure to stop leakage. Provisions for packing injection shall be by devices located radially about the stuffing box and designed to permit a maximum evacuation of packing at the bottom of the packing device when the injector is fully engaged. The number of devices with injectors for each stuffing box shall be in accordance with the manufacturer’s standard practice. The design of the packing injection devices shall be such as to ensure no blowback of injectable packing or the service fluid when injecting packing under full-line pressure.
6.1.2 Style II—The expansion joint shall be the same as Style I except low-friction corrosion-resistant material or inserts shall be used for internal and external guiding to prevent slip scoring from pipe misalignment or vibration and to prevent corrosion of the guide surfaces.
6.1.3 Form I—Welded End: The expansion joint shall have provisions at each end of the joint for field welding to the adjoining pipe line.
6.1.4 Form II—Flanged End: The expansion joint shall have flanges at each end of the joint for bolting to the mating flanges of the adjoining pipe line.
6.1.5 Form III—The expansion joint shall have other end connections as specified for attaching to the adjoining pipe line.

7. Design

7.1 The expansion joint shall be designed to conform to applicable sections of the latest edition of ANSI B31.1 and other applicable documents as noted in Section 2.
7.2 Compression Force—Unless otherwise specified, the force to compress or extend the slip of the expansion joint shall not exceed 1000 lbf/in. (175 100 N/m) of nominal pipe diameter.

8. Construction

8.1 Slip—The slip shall be manufactured from steel pipe conforming to Specification A 53/A 53M, Grade B, or a rolled and welded cylinder from Specification A 285/A 285M, Grade C plate, or equal with the longitudinal weld seam 100 % radiographed. The minimal wall thickness of the pipe or rolled cylinder shall be equivalent to Schematic 80 pipe for all sizes to 14 in. (356 mm), inclusive and Schematic 60 for sizes 16 to 24 in. (406 to 610 mm) to preclude slip collapse as a result of external loading of the injectable packing. Heavier wall pipe may be required for expansion joints subjected to pressures above 600 psig and for pipe sizes above 24-in. (610-mm) diameter.
8.1.1 Chrome Plate—The slip of the expansion joints shall be chrome plated with engineering chrome in accordance with Specification B 650, Class 50.
8.2 Stuffing Box—The stuffing box with integral internal and external guides shall be machined from Specification A 53/A 53M, Grade B Pipe, or AISI C-1018 seamless tubing or cast steel in accordance with A 216/A 216M, Grade WCB. A rolled and welded cylinder from Specification A 285/A 285M, Grade C plate, or equal may be used provided the longitudinal weld seam is 100% radiograph examined in accordance with ANSI B31.1 and ASME Code Section V.

8.3 Traverse Chamber—This chamber, also referred to as the “E.J. Body,” shall be machined from Specification A 53/A 53M, Grade B seamless steel pipe having a wall thickness suitable for the design service conditions. A rolled and welded cylinder from Specification A 285/A 285M, Grade C, or equal steel plate of suitable thickness for the design service conditions may also be used if the longitudinal weld seam is 100% radiograph inspected to ANSI B31.1 and ASME Code Section V.

8.4 End Connections—The end connections of the expansion joint (see Section 6) shall be flanged, weld end, combination of both, or others as specified. Flanges shall conform to ANSI B16.5 and be of the size, material, pressure class, and facing specified. Weld ends shall be beveled for welding to ANSI B16.5 and be of the size, material, pressure class, and nation of both, or others as specified. Flanges shall conform to ANSI B31.1 and ASME Code Section V.

8.4.1 Body End Connection for Class I Expansion Joints:
8.4.1.1 Form I—Weld End: The reduction of the body size to the pipeline size shall be accomplished by a formed reduction of the traverse chamber (body) or by a reducer butt welded to the traverse chamber (body) that meets the requirements of ANSI B31.1 and the ASME Code Section VIII, Division 1.

8.4.1.2 Form II—Flanged End: Forged flanges shall be attached to the body by butt welding only and shall be in accordance with the requirements of ANSI B31.1 and the ASME Code Section VIII, Division 1.

8.5 Limit Stops—Limit stops may be of the external or internal type manufactured from a suitable material and designed to withstand the full-line pressure thrust load in the event of a pipeline anchor failure.

8.6 Internal and External Guides—See 8.2.

8.6.1 Low-Friction Internal and External Guides—The low-friction internal and external guides or inserts shall be made from noncorrosive materials with appropriate differential hardness to also prevent scoring or binding of the slip.

8.7 Base:

8.7.1 Expansion Joint Without a Service Connection—When a base is specified for Class I expansion joints, the base shall be designed for use as a main anchor. Class II expansion joints shall have a base that is suitable as an intermediate anchor. The base shall be of cast or fabricated steel that conforms to the applicable ASTM standard and shall be suitably attached to the joint and drilled in accordance with the manufacturer’s standard practice.

8.7.2 Expansion Joint With a Service Connection—Class I and Class II expansion joints with a service connection shall be provided with a main anchor base and all anchor loading data (forces and moments) shall be made available to the manufacturer to assure adequate anchor design. The base shall be of cast or fabricated steel that conforms to the applicable ASTM standard and shall be suitably attached to the joint and drilled in accordance with the manufacturer’s standard practice.

8.8 Service Connection—Unless otherwise specified, a service connection, when required, shall be the manufacturer’s standard design and shall meet the applicable requirements of the ASTM, ANSI, and ASME Codes. The service connection shall be supplied with end connections as specified (see 8.5).

8.9 Drain Connection—When required, a drain connection shall be attached to the body of the expansion joint and shall be the manufacturer’s standard unless otherwise specified. The drain connection shall meet the requirements for fitting connections as specified in ANSI B31.1.

8.10 Packing—Unless otherwise specified, the packing shall be the manufacturer’s standard-type packing and shall be suitable for the specified service conditions.

8.11 Other Materials of Construction—Where the expansion joint is to transfer corrosive fluids, or be installed in a corrosive atmosphere, corrosive-resistant materials as specified may be substituted for the carbon steel components, especially the sliding slip.

9. Drawing Requirements

9.1 Drawings—When specified, dimensional sketches or drawings sufficiently detailed to describe the expansion joint to be supplied, shall be submitted with bid proposals. The inch-pound system of measurements shall be used to dimension drawings. Drawings shall note that the design of the components or products is in full compliance with this specification.

10. Cleaning and Surface Preservation

10.1 Cleaning—The internal and external surfaces of the expansion joint shall be cleaned of dirt, oil, grease, and other foreign material using a suitable cleaning solvent. Extreme care shall be used to ensure the interior is free of any slag, steel chips, or other similar materials that could lodge between the slip and the body and score the slip surface.

10.2 Surface Preservation—Unless specified, no preservation will be required on the internal surface of the expansion joint. All external surfaces except the chrome-plated slip surface, flanged faces, and weld bevel surfaces shall be painted in accordance with the manufacturer’s standard practice. Weld end joint surfaces for field welding shall be coated with “deoxaluminate” preservative.

11. Packaging and Package Marking

11.1 All openings shall be suitably sealed to protect the opening connection surfaces and prevent entrance of foreign materials.

11.2 Unless otherwise specified, the exposed chrome-plated surface of the slips shall be protected in accordance with the manufacturer’s standard practice.

11.3 Unless otherwise specified, the completed expansion joints shall be suitably attached with steel strapping or hold down bolting to wood skids or crates in accordance with standard commercial practice for domestic shipments.
12. Quality Assurance

12.1 Inspection—Unless otherwise specified, the contractor shall perform inspections as required to assure compliance with this specification. The procuring agency may establish inspection requirements, and it is the contractor’s responsibility to provide access to his facilities for the procuring agency’s inspection of material, work in process, and quality assurance testing or results as required.

12.2 Material Certification—Certified material test reports or certificates of compliance shall be required for all pressure-retaining material. To maintain traceability, all pressure-retaining material shall be metal stamped or otherwise suitably marked with heat treat numbers or other identification codes. If metal stamping is used, the indentations shall not exceed 1/32 in. (0.8 mm) or infringe on minimum wall thickness. A round-nose, low-impression-type stamping die shall be used.

12.3 Nondestructive Testing—When required, all nondestructive testing shall be performed by qualified personnel in accordance with qualified acceptable procedures.

12.3.1 Radiography—Radiographic examination of welds shall be in accordance with ANSI B31.1 and Section V of the ASME Code.

12.3.2 Visual Examination, Magnetic Particle, and Liquid Penetrant Examination—Whenever required, these examinations shall be in accordance with ANSI B31.1 and Section V of the ASME Code.

Standard Specification for Flashlights on Vessels

This standard is issued under the fixed designation F 1014; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope
1.1 This specification covers three types of flashlights (see Section 4).
1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.
1.3 The following precautionary caveat pertains only to the test method portion, Section 9, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents
2.1 Military Standard:
MIL-STD-105D Department of Defense Standard; Sampling Procedures and Tables for Inspection by Attributes
2.2 UL Standard:
UL Standard No. 783

3. Terminology
3.1 Definitions of Terms Specific to This Standard:
3.1.1 lot—a manufacturer's production run for a specific type of flashlight.
3.1.2 order batch—the size of a specific contract or purchase order taken from the lot.
3.1.3 production testing—the testing performed during a lot run of specific flashlights.

4. Classification
4.1 The three types of flashlights covered in this specification are classified as follows:

4.1.1 Type I—Flashlights for use in lifeboats and liferafts.
4.1.2 Type II—Flashlights for use in hazardous locations where fire or explosion hazards may exist due to the presence of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers or flyings.
4.1.3 Type III—Flashlights for use in lifeboats and liferafts and suitable for hazardous locations.

4.2 Type I flashlights shall be manufactured in accordance with Sections 2-11. Type II flashlights shall meet the requirements in Sections 11 and 12. Type III flashlights shall meet the requirements in Sections 2-12.

5. Materials and Manufacture
5.1 Materials—All materials used in the construction of these flashlights shall be of a quality suitable for the purpose intended and shall conform to the requirements of this specification.
5.2 Manufacture—Plastic, when used, shall be a suitable thermoplastic or thermosetting material so molded as to produce a dense solid structure, uniform in texture, finish, and mechanical properties.

6. General Requirements
6.1 Each flashlight shall be a three-cell light.
6.2 Each flashlight shall provide a concentrated beam of light. When used in this specification, a concentrated beam of light is light projected in a nearly parallel beam and is used to illuminate objects at considerable distances.
6.3 The flashlight shall show no leakage of water and shall be in perfect working order following the test prescribed in 9.2.
6.4 The proportions and design of each flashlight shall be such that the assembled unit complete with lamp and cells shall be capable of withstanding, without breakage or material distortion of any part and without upsetting the lamp focus, the test specified in 9.6. Damage of lamp filament or shifting of filament within the lamp as a result of this test shall not be cause for rejection of the flashlight if the flashlight operates when the spare lamp is used.
6.5 Each flashlight must be furnished with two lamps. One of these lamps is a spare and must be contained within the body of the flashlight, either in the end cap or reflector head area.
6.6 All metal parts of each flashlight shall be made of corrosion-resistant material. All copper or copper-alloy parts coming in contact with rubber shall not corrode or disintegrate the rubber.

6.7 The construction of each flashlight shall be such that a metallic contact outside the case cannot close the battery circuit and cause the light to come on.

6.8 Each flashlight shall be provided with means to prevent it from rolling.

7. Physical Requirements

7.1 Dimensions—Each flashlight shall not exceed 11½ in. (292 mm) in length and shall have a lens ring diameter of no more than 2½ in. (63.5 mm).

7.2 Case, Lens Head Ring, and End Cap:

7.2.1 The flashlight case must be suitable to receive three commercial D-size dry cells. The exterior of the flashlight shall have molded flutes or ribs to provide a satisfactory gripping surface when wet. Cells must be held in the case under sufficient pressure to ensure good contact and to prevent breaking of the circuit when the flashlight is tested in accordance with 9.1.2. The flashlight must be constructed so that the cells are readily replaceable.

7.2.2 The case, ring, and cap, need not be made of the same material but cooperating threaded surfaces should be of the same type material.

7.3 Lens—The lens shall be of good quality, laminated, shatter-proof glass or clear plastic, free from bubbles, striae, wrinkles, or other defects and blemishes that would affect the light distribution. The lens shall be secured to the lens head ring by a suitable retaining ring or other device so as to prevent it from being dropped when the lens head ring is unscrewed.

7.4 Reflector—The reflector may be of metal or plastic and must have sufficient rigidity so as not to become distorted when the flashlight is completely assembled with cells and lamp. It must have an essentially parabolic reflecting surface, highly polished and resistant to corrosion and discoloration. The reflector shall be 1 ¾ ± ¼ in. (44 ± 6 mm) in diameter.

7.5 Lamps—The lamps shall be appropriate for use with alkaline or carbon-zinc batteries. Each lamp must have a lamp life of at least 15 h at the rated battery voltage.

7.6 Lamp Holder—The lamp shall be firmly positioned in the reflector. It shall be so positioned that the lamp, when assembled in the holder, shall have its filament located at the focus of the reflector, with the accuracy necessary to produce a concentrated beam of light as specified in 9.7. It shall have sufficient rigidity so as not to become distorted when the flashlight is completely assembled with cells and lamp. Means shall be provided to protect the lamp from damage by battery impact and for conveniently removing and replacing the lamp. The mounting adjustment shall have sufficient stability to retain the focal adjustment of the lamp under a condition of vibration, and when the flashlight is tested in accordance with 9.1.2.

7.7 Switch—The switch shall be conveniently located and securely attached to the flashlight. It shall be provided with a permanent “ON” position, a manually operable signaling or “FLASHING” position, and a locked “OFF” position. It shall be provided with means to prevent accidental closing of the lamp circuit. The switch parts and switch contact strip shall be adequately insulated so that it will be impossible for metal-clad cells to close a circuit when the switch is on the “OFF” position. The flashlight shall be designed with a switch guard. Contact springs shall be of phosphor bronze, spring brass, or other corrosion-resistant equivalent material.

7.8 Suspension Member—Each flashlight shall be equipped with a suitable suspension ring or clip. The ring or clip shall be tested as specified in 9.8.

8. Workmanship

8.1 Flashlights shall be of sturdy construction and free of mechanical, electrical, or other imperfections or defects that materially affect appearance or that may affect quality, reliability, or serviceability. The finished flashlight shall not contain rough edges, burrs, blemishes, or other disfigurements and shall be clean, free from rust, toolmarks, pits, and other injurious defects.

8.1.1 Threaded parts shall be smooth and close fitting and shall be capable of being easily moved by hand relative to each other. Threaded parts shall not jump or change adjustment when being put together or when subjected to the tests in Section 9.

9. Test Methods

9.1 Switches:

9.1.1 Switch Leakage—With the lamp and reflector removed, insert fresh batteries into the flashlight. Connect a voltmeter across the switch and battery or the switch and battery contacts, as appropriate, in such a way as to read the battery voltage through the switch. With the switch in the “OFF” position, read the voltage. Any distinguishable deflection of the meter hand when the meter is set in the voltage range, nearest the battery voltage, shall constitute failure of this test.

9.1.2 Operation—Insert batteries into the flashlight and operate the switch five times in each of the three switch positions. Shake the flashlight vigorously in each “ON” and “FLASHING” switch position. The flashlight must not go off when shaken vigorously while the switch is in the “ON” or “FLASHING” position.

9.1.3 Switch Endurance—Test the contact switch mechanism of the flashlight by operating the switch for 25 000 continuous cycles. A cycle shall consist of movements from “OFF” position through the full “ON” and “FLASHING” positions and back to “OFF” position. Operate the switch under normal electrical load conditions, and replace the lamp and batteries as often as required to ensure that the switch mechanism is operating under normal load throughout the 25 000 cycles. Burning out of bulbs and batteries during the test shall not constitute failure of this test. Failure of the switch to complete 25 000 cycles shall constitute failure of this test.

9.2 Watertightness—Test the flashlight as follows:

9.2.1 Submerge the assembled flashlight in a salt water solution (1.04 sp gr) under a head of 1 ft (0.3 m) for a period of 24 h at a water temperature of 65°F (18°C). Remove the flashlight and wipe off the excess water. The total water absorption shall not exceed 5 % weight. The flashlight shall be
capable of being disassembled and reassembled without undue difficulty upon completion of the test and shall be in perfect working order.

9. Impact:

9.3.1 Test Conditions—Place the flashlight, without batteries installed, in a cold chamber at −40 ± 5°F (−40 ± 3°C) for 2 h. With the flashlight stabilized at this temperature, immediately subject it to the low- and high-impact test specified in 9.3.2 and 9.3.3. Apply the point of impact to the following:

9.3.1.1 The outside of the flashlight case at a point midway between the ends of the case on a side 90° from the switch,

9.3.1.2 The switch (in the “ON” position and in the “OFF” position),

9.3.1.3 The lens cap, and

9.3.1.4 The end cap.

9.3.2 Low Impact—Subject the flashlight to a 12-lbf-in. (1.4 N·m) impact using a 1-lb (0.4-kg) steel ball at each of the points of impact specified in 9.3.1. Provided the flashlight remains intact, next subject the flashlight to the watertightness test (see 9.2). There shall be no evidence of breakage from impact or moisture in the case.

9.3.3 High Impact—After the flashlight passes the low-impact test, again place the flashlight in the cold chamber at −40°F ± 5°F (−40 ± 3°C) for 2 h, and then immediately subject it to a 20 lbf-in. (2.3 N·m) impact using a 1-lb (0.4-kg) steel ball at each of the points of impact specified above. There shall be no evidence of damage to the case, the lens, or the end cap.

9.4 Environmental:

9.4.1 Heat and Humidity—Place the flashlight, with dry cells, on a horizontal surface and subject to dry heat at 150 ± 5°F (65.6 ± 3°C) for 16 h, followed by an 85 ± 5 % relative humidity at 100 ± 2°F (38 ± 1°C) for 6 h. The flashlight shall be compared with untested flashlights for dimensional stability, crazing of surface, and then tested to determine that the flashlight operates in accordance with 9.1.2.

9.5 Corrosion—Subject the flashlights, without dry cells, to salt spray for 200 h. Then wash the flashlight with fresh water, dry, and then test to determine that the flashlight operates in accordance with 9.1.2. There shall be no evidence of corrosion.

9.6 Rough Use—Drop the flashlight, complete with dry cells, lamps, and lens, 5 ft (1.5 m) in free fall onto a vinyl-asbestos tiled concrete floor. Drop the flashlight twice in a horizontal position upon the switch, with the switch in the “ON” position, twice in a horizontal position upon the switch, with the switch in the “OFF” position, twice in a vertical position upon the head of the flashlight, and upon the base of the flashlight. Do not tighten parts once the test has begun. There shall be no evidence of damage to any part of the flashlight. Then test the flashlight in accordance with 9.1.3.

9.7 Light Projection—The flashlight must project a concentrated beam of light not less than 5 in. (127 mm) nor more than 11 in. (279 mm) in diameter when located 5 ft (1.524 m) from a screen. The plane of the screen must be perpendicular to the optical axis of the flashlight.

9.8 End Cap Ring—The end cap ring shall support a weight of 25 lb (11.3 kg) for 1 min without evidence of distortion.

10. Marking, Packaging, and Packing

10.1 Product Marking—Each flashlight conforming to all the requirements in this specification shall be marked with the name, brand, or trademark of the manufacturer, this ASTM specification number, the type of flashlight (Type I, Type II, or Type III), and any other information as may be specified in the contract or purchase order.

10.2 Unless otherwise specified by the customer in the contract or purchase order, the flashlight shall be packaged, packed, and marked in accordance with the manufacturer’s commercial practice to ensure acceptance and safe delivery by the carrier for the mode of shipping and handling.

11.1 Unless otherwise specified in the contract or purchase order, the producer is responsible for the performance of all inspection and requirements as specified herein. Except as otherwise specified in the contract or purchase order, the producer may use his own or any other facilities suitable for the performance of the inspection requirements specified herein. The purchaser reserves the right to perform any of the inspections set forth in this specification where such inspections are deemed necessary to ensure that the flashlights conform to the prescribed requirements.

11.2 The producer shall perform the necessary inspection and tests to ensure that an S-4 inspection level, in accordance with MIL-STD-105D, is provided. An Acceptable Quality Level (AQL) of 1 % defective for the operational test and the switch leakage test, and an AQL of 4 % for any of the other requirements or tests specified shall be provided. Sample testing shall be in accordance with Table 1.

12. Flashlights for Use in Hazardous Locations on U.S. Flag Merchant Vessels

12.1 Details such as dimensions, construction criteria, battery configuration, and voltage shall be provided by the procuring agency in the contract or purchase order.

12.2 Flashlights that are to be used in hazardous locations shall conform to the requirements of Underwriters Laboratories (UL) Standard No. 783, or equivalent standard, and to the following requirements.

12.3 Flashlights that are to be used in hazardous locations shall be listed by an independent testing laboratory that is concerned with product evaluation, that maintains periodic inspection of production of listed flashlights, and whose listing states that the flashlight has been tested and found suitable for

use in the hazardous location specified (that is, Class and Group designation). The testing laboratory must be acceptable to the appropriate regulatory bodies or the procurement agency.

12.4 Flashlights that have been listed by a testing laboratory meeting the criteria in 12.3 shall affix a label, symbol, or other identifying mark to the flashlight that shall indicate that the flashlight is suitable for use in the hazardous location.
Standard Specification for
Steel Emergency Gear Stowage Locker

This standard is issued under the fixed designation F 1018; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the design, material, and manufacture of steel emergency gear stowage lockers.

1.2 Emergency gear lockers shall be of four types (see Section 3).

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:
A 36/A36M Specification for Carbon Structural Steel
A 276 Specification for Stainless Steel Bars and Shapes
A 366/A366M Specification for Commercial Steel (CS) Sheet, Carbon (0.15 Maximum Percent) Cold-Rolled
A 513 Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing
A 563 Specification for Carbon and Alloy Steel Nuts
B 36 Specification for Brass Plate, Sheet, Strip, and Rolled Bar
B 124 Specification for Copper and Copper Alloy Forging Rod, Bar, and Shapes
B 176 Specification for Copper-Alloy Die Castings

2.2 ANSI Standards:
B18.1.1 Small Solid Rivets
B18.6.3 Slotted and Recessed Head Machine Screws and Machine Screw Nuts
B18.21.1 Lock Washers
B27.2 Plain Washers

2.3 Other Documents:
ABS Rules for Building and Classing Steel Vessels
SSPC Specification
AWS D1.1 Welding Code

3. Classification

3.1 Emergency gear lockers shall be classified in four types as follows:

3.1.1 Type I—For stowage of one complete fireman’s outfit, conforming to all requirements of all sections, figures, and details of this specification.

3.1.2 Type 2—For stowage of two complete firemen’s outfits, conforming to all requirements of all sections, figures, and details of this specification.

3.1.3 Type 3—For stowage of one complete fireman’s outfit, with locker dimensions in accordance with Figs. 2, 3, and 4 (dimensions only), and conforming to the requirements of 3.2, 3.3, 4.1, 5.2.4, and Sections 6 and 7 inclusive.

3.1.4 Type 4—For stowage of two complete firemen’s outfits, with locker dimensions in accordance with Figs. 2, 3, and 4 (dimensions only), and conforming to the requirements of 3.2, 3.3, 4.1, 5.2.4, and Sections 6 and 7 inclusive.

3.2 One complete fireman’s outfit shall consist of the following emergency gear (not included in this specification):

3.2.1 Self-contained breathing apparatus (24 by 14 by 11 in. (610 by 355 by 280 mm)).
3.2.2 Recharge air tank (7-in. (180-mm) diameter by 22 in. (560 mm) long).
3.2.3 Set protective clothing, including helmet, gloves, and boots.
3.2.4 Lifeline (150 ft (45 m), 18 by 18 by 10 in. (455 by 455 by 255 mm)).
3.2.5 Three-cell, explosion-proof flashlight with spare cells.
3.2.6 Flame safety lamp.
3.2.7 Fire axe.

3.3 In addition to the equipment listed in 3.2, each locker shall contain space for the following (not part of this specification):

3.3.1 First-aid kit, (1), (10 by 10 by 7 in. (255 by 255 by 180 mm)).

3.3.2 Spare air tanks, as space allows (see Figs. 2, 3, and 4).

4. Ordering Information

4.1 Order using this ASTM designation, year of issue, locker type, and finish.

5. Materials and Manufacture

5.1 Materials—Materials shall be as specified in Table 1.

5.2 Manufacture:

5.2.1 Mandatory dimensions and construction details for Types 1 and 2 are as depicted in Figs. 1-9.

5.2.2 Mandatory dimensions for Types 3 and 4 are as shown in Fig. 2, Fig. 3, and Fig. 5, respectively, and applicable details of Sections “A-A” and “B-B.” Alternative construction details are permissible.

5.2.3 Construction details depicted in Figs. 4-9, while specifically referring to locker Type 2, shall be adapted to suit locker Type 1.
5.2.4 Welded construction, in accordance with ABS Rules for Building and Classing Steel Vessels or AWS D 1.1 Structural Welding Code shall be used throughout, unless otherwise specified.

6. Dimensions and Tolerances

6.1 Dimensions are as indicated.

6.2 Tolerance—±1/16 in. (1.5 mm).
7. Workmanship, Finish, and Appearance

7.1 Entire assembly shall be free of weld spatter, slag, splinters, sharp edges, burrs, projections, and other defects that may be hazardous to personnel.

7.2 The locker shall be cleaned after assembly to a commercial finish in accordance with SSPC-SP6.

7.3 Unless otherwise required by the ordering documents, the unit shall have the manufacturer’s standard baked-on enamel finish.

7.3.1 The color shall be specified in the ordering documents.

Standard Specification for Steel Deck Gear Stowage Box [Metric]

This standard is issued under the fixed designation F 1019M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the design, material, and manufacture of steel deck gear stowage boxes.

1.2 This specification shall not be used for life preserver or pyrotechnic stowage.

1.3 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:
A 36/A36M Specification for Carbon Structural Steel
A 123/A 123M Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

2.2 Other Documents:
ABS Rules for Building and Classing Steel Vessels
SSPC Specification
AWS D1.1 Structural Welding Code

3. Classification

3.1 Deck Gear Stowage Boxes, shall be the following types:
3.1.1 Type I—Conforming to all dimensions in Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6, Fig. 7, Fig. 8, and Fig. 9.
3.1.2 Type II—Conforming only to Fig. 1 configuration and meeting the requirements of Sections 4-7, dimensions and material specification made to fit unique requirements of customer.

---

1 This specification is under the jurisdiction of ASTM Committee F-25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting.
3 Annual Book of ASTM Standards, Vol 01.06.
4 Available from American Bureau of Shipping, ABS Plaza, 16855 Northchase Dr., Houston, TX 77060.
5 Available from Steel Structures Painting Council, 4400 5th Ave., Pittsburgh, PA 15213.

4. Ordering Information

4.1 Order using this ASTM designation, year of issue, and type.

5. Materials and Manufacture

5.1 Materials:

5.1.1 The steel for the deck box shall be in accordance with Specification A 36/A 36M.

5.1.2 Nuts, bolts, and washers shall be corrosion-resistant materials.

5.1.3 Materials used in construction of this box and its packaging shall be free of asbestos and cadmium.

5.2 Manufacture:

5.2.1 Stowage boxes shall be constructed in accordance with figures appearing in this standard.

5.2.2 Welding shall be in accordance with ABS Rules for Building and Classing Steel Vessels or AWS D1.1 Structural Welding Code unless otherwise specified.

6. Dimensions and Tolerances

6.1 Dimensions are as indicated.

6.2 Tolerance—1.5 mm (±1/16 in.).

7. Workmanship, Finish, and Appearance

7.1 The entire assembly shall be free of weld spatter, slag, splinters, sharp edges, projections, and other defects that may be hazardous to personnel.

7.2 The box shall be cleaned after assembly to a commercial finish in accordance with SSPC-SP6.

7.3 All surfaces except gratings and covers shall be coated with one coat of commercial quality anticorrosive, lead-free, chromate-free primer to a minimum dry film thickness of 50 µm.

7.4 Gratings and covers shall be galvanized in accordance with Specification A 123/A 123M.

Standard Specification for
Line-Blind Valves for Marine Applications

1. Scope

1.1 This specification provides the minimum requirements for design fabrication, pressure rating, and testing for line-blind valves.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following safety hazards caveat pertains only to the test methods portion, Section 5, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
   A 53/A 53M Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless  
2.2 ANSI Standards:
   B16.5 Pipe Flanges and Flanged Fittings, Steel-Nickel Alloy and Other Special Alloys  
B31.1 Power Piping

2.3 MSS Standards:
   SP-6 Finish for Contact Faces of Pipe Flanges and Connecting End Flanges of Valves and Fittings  
SP-25 Marking System for Valves, Fittings, Flanges, and Unions  
SP-55 Quality Standard for Steel Castings for Valves, Flanges and Fittings, and Other Piping Components (Visual Method)  

2.4 ASME Standard:
   ASME Boiler and Pressure Vessel Code, Sections II, VIII, IX

3. Descriptions of Terms Specific to This Standard

3.1 blank—a solid one-piece circular unit inserted into a pipeline to prevent flow.

3.2 line-blind valve—an assembly consisting of a spectacle plate, bolting, and body, the purpose of which is to provide a convenient means to align a piping system to an open or positively closed configuration. The assembly is designed to provide a simplified method of changing over the flow control spectacle plate without the necessity of plate removal from the valve body.

3.3 spectacle plate, (also spectacle blind)—a figure-eight-shaped unit with one end open for flow and the other solid to prevent flow.

4. Materials and Manufacture

4.1 Materials:
   4.1.1 Materials for spectacle plates, bolting, and body shall be those contained in ASME Section II. For the purpose of stress calculations, ASME Section VIII values shall be used.
   4.1.2 All welding shall be done with procedures and welders qualified in accordance with ASME Section IX and 80% weld efficiency factor shall be used.
   4.1.3 All castings shall be visually inspected and acceptable in accordance with MSS-SP-55.

4.2 Manufacture:
   4.2.1 The spectacle plate shall be designed in accordance with ANSI B31.1, Paragraph 104.5.3.
   4.2.2 The calculations of 4.2.3 and 4.2.4 shall ensure that a line blind is designed for the gasket material, of all that can be used with the line blind being designed, that imposes the most critical bolt-load conditions as a result of its gasket factor, \( m \), and gasket or joint-contact-surface unit seating load, \( y \).
   4.2.3 The bolting shall be either of the following:
   4.2.3.1 Modify the external loads in accordance with ASME B31.1, Paragraph 104.5.3.
   4.2.3.2 The equivalent in cross section to that of ANSI B16.5 flange bolting of equivalent nominal size and pressure.
   4.2.3.3 In no case shall bolts have a nominal diameter less than \( \frac{1}{2} \) in. (12.7 mm).
   4.2.3.4 The material class shall be an approved ANSI B16.5 material or equal in tensile strength.
   4.2.3.5 Cast bolting shall be X-rayed or have an 80% efficiency factor applied.

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.
2 Annual Book of ASTM Standards, Vol 01.01.
3 Available from American National Standards Institute, 25 W. 43rd St., 4th Floor, New York, NY 10036.
4 Available from Manufacturer’s Standardization Society of the Valve and Fittings Industry, Inc., 1815 N. Fort Myer Dr., Arlington, VA 22209.
4.2.4 The body shall be calculated using ASME Section VIII, Division 1, Appendix 2 with consideration for the size and material of bolting in the appendix, the bolt load satisfying Note 2 of Paragraph 2-5 of Appendix 2.

4.2.5 The spectacle plate and mating body facings shall be in accordance with MSS-SP-6.

5. Testing

5.1 Each valve body shall be hydrostatically tested to the shell test pressure in accordance with ANSI B16.5, Table 3. A valve supplied to the WOG standard shall be tested up to the nearest ANSI Class.

5.2 Each valve shall be tested for leakage at pressure 1.5 times the cold water rating of the valve rounded upward to the next higher 25-psi (170-kPa) increment. Acceptance criteria shall be that no leakage occurs during a 10-min “hold time” at pressure.

6. Calculations

6.1 Bolting calculations from ASME Section VIII, Division 1, Appendix 2 shall be modified to account for an externally applied load as a result of piping. Add to the minimum required bolt load for the operating conditions, \( W_{m1} \), an external moment bolt load, \( H_x \), such that the modified total cross-sectional area of the bolts shall be as follows:

\[
A'_{m1} = (W_{m1} + H_x)/S_b
\]

where:

- \( H_x = SZ/d_b \)
- \( Z = \Pi((D^4_o - D^4_{i})/D_o)/32, \)
- \( D_i = D_o - 2t_p, \)
- \( t_p = PD_l/(2(0.875)(S)), \) but not less than 0.25 in. (6.4 mm), and
- \( d_b = C\Pi + 2((G_o^3 - G_i^3)/(G_o^2 - G_i^2))3\Pi. \)

6.1.1 All terms are identical to those defined in ASME Section VIII, Appendix 2 with the addition of the following:

6.1.1.1 \( A'_{m1} \) = modified total cross-sectional area of bolts at root of thread or section of least diameter under stress, required for the operating conditions, square inch (square millimetre).

6.1.1.2 \( H_x = \) external moment of bolt load, lbf (N).

6.1.1.3 0.875 = assumed pipe wall tolerance factor.

6.1.1.4 \( S = \) ASME allowable stress of the pipe material at design temperature, psi (kPa) (for purposes of meeting this specification, 15 000 psi (103.4 MPa) from Specification A 53/A53M, Grade B, Type S shall be acceptable).

6.1.1.5 \( Z = \) section bolt load, square inch (square millimetre).

6.1.1.6 \( D_o = \) nominal outside diameter of pipe, inches (millimetres).

6.1.1.7 \( D_i = \) calculated inside diameter of pipe, inches (millimetres).

6.1.1.8 \( t_p = \) calculated pipe wall thickness, inches (millimetres).

6.1.1.9 \( d_b = \) moment arm of external moment on bolts and gasket, inches (millimetres).

6.1.1.10 \( G_o = \) outside diameter of contact surface of gasket, inches (millimetres).

6.1.1.11 \( G_i = \) inside diameter of contact surface of gasket, inches (millimetres).

6.2 The selection of bolts to be used shall be made such that the actual total cross-sectional area of bolts, \( A_m \), will not be less than \( A_{m1} \), where \( A_m \) is taken as the greater of \( A'_{m1} \) and \( A_{m2} \).

7. Product Marking

7.1 Each valve must have the following markings in accordance with MSS-SP-25:

7.1.1 Manufacturer’s name and trademark.

7.1.2 Appropriate pressure class.

7.1.3 Size of end connection.

7.1.4 ASTM designation of materials.

7.1.5 ASTM designation and year of issue of this specification.

8. Keywords

8.1 blind valve; line-blind valve; marine technology; piping system; ship; valve
1. **Scope**

   1.1 This practice provides guidance in the selection of manual and power-actuated valve operators.

   1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

   1.3 *This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. **Referenced Documents**

   2.1 ANSI Standard:
   
   B16.5 Pipe Flanges and Flanged Fittings

3. **List of Valve Operator Types**

   3.1 **Manual Operators:**
   
   3.1.1 Handwheels.
   
   3.1.2 Tee-wrenches.

   3.2 **Electric Operators:**
   
   3.2.1 Stem Nut Driven.
   
   3.2.2 Handwheel Driven.

   3.3 **Pneumatic Operators:**
   
   3.3.1 Stem Nut Driven.
   
   3.3.2 Handwheel Driven.

   3.4 **Hydraulic Operators:**
   
   3.4.1 Stem Nut Driven.
   
   3.4.2 Handwheel Driven.

4. **General Requirements**

   4.1 General requirements apply to all types of valve operators.

   4.2 Operating terminals shall be accessible during all service conditions but shall not constitute an obstruction in working spaces.

   4.3 Valve controls that are not immediately identifiable as to service shall be fitted with name plates.

   4.4 Valve operating stations shall be fitted with a valve position indicator unless valve position is obvious for the service intended (full open or full closed), or valve is classified damage control smaller than 1½ in. (38.1 mm).

   4.5 Positioning of the valve by either the local or remote actuators shall not void the ability of any other actuator to position the valve.

   4.6 All valves, regardless of size, shall be readily operable by one man in a reasonable and limited time period, either through a manual or power-actuated valve operator.

5. **Manual Valve Operators**

   5.1 Material for handwheels and tee-wrenches for casualty or damage control shall be either malleable iron, ductile iron, or steel.

   5.2 Portable valve wrenches shall be labeled and stored near the valve operating station. Valve operating wrenches shall fit and turn (to open and close) deckbox operator covers.

   5.3 Valves shall be located to prevent the necessity for ratchet wrenches wherever possible. Ratchet wrenches are, however, permitted where valve location prevents complete wrench rotation.

   5.4 Handwheel diameter and tee-wrench handle length, based on the system torque at the operating station, is presented in Table 1.

6. **Requirements for Power-Actuated Valve Operators**

   6.1 Requirements for power-actuated operators apply to electric, pneumatic, and hydraulic valve operators.

   6.2 All power-actuated valves, except for valves within tanks, shall have a means for local, manual operation. Manual operation shall override power operation of the valve. Stem nut driven electric, pneumatic, and hydraulic operators shall return to the power mode after manual reset.

   6.3 To prevent personnel injury during remote actuation of the valve, the manual handwheel shall be either the solid disk type, or it shall have a spoke cover plate or handwheel enclosure, or it shall disengage so that it does not rotate.

   6.4 Valve actuators in critical systems may be provided with an energy storage system with sufficient capacity to cycle the valve once (from the initial position to the opposite and return).
7. Electric Valve Operators

7.1 The valve operator shall be powered by the ship’s service power system. Critical valve operators may be additionally powered by an emergency power system.

7.2 Handwheel acting operators shall consist of the electric motor, gearing, limit and torque switches, reversing starter and pilot lights, and permanently mounted handwheel to form a complete self-contained unit to be mounted directly on the valve or through a reach rod transmission with flanges in accordance with ANSI B16.5.

7.2.1 Renewable stem nuts shall be provided for stem acting operators instead of the permanently mounted handwheels.

7.3 The operator shall be suitable for marine service rated for the ambient temperature in which it will operate. For weather deck applications 104°F (40°C) is considered standard. For machinery spaces 122°F (50°C) is standard.

7.4 The motor shall be one of the following:

7.4.1 Single Phase, 115 Vac, capacitor start, capacitor run.

7.4.2 Three Phase, 460 Vac.

7.4.3 Both types shall have insulation of Class B or Class F with Class B temperature rise. The motor shall have built-in thermal and overload protection.

7.5 The operator shall transmit power from the motor to the valve stem, valve handwheel, or reach rod transmission system through a bevel gear, worm gear, or planetary gear system. Ball or roller bearings shall be used throughout.

7.6 The gear system shall not permit backdrive through the operator upon interruption of electric power.

7.7 The closing and opening operation shall be regulated by means of a travel-activated device and a torque-activated device as a backup.

7.8 The operator enclosure shall be explosion proof and submersible, with submersible electric connections where service conditions dictate.

8. Pneumatic Valve Operators

8.1 Position indication of pneumatic-actuated valves shall be accomplished by a self-indicating air cock and a pressure gage or other acceptable means installed in the actuating line as close to the control board as possible.

8.2 Systems with a maximum allowable working pressure in excess of 150 lb/in.² (10.3 bar) shall be designed with a surge tank or other acceptable means of pulsation dampening.

8.3 The system shall be designed so that proper functioning of any unit shall not be affected by back pressure in the system.

8.4 Suitable drains shall be provided at low points of piping systems.

9. Hydraulic Valve Operators

9.1 Each hydraulic operating system shall be self-contained including the necessary piping and a reservoir tank for the operating fluid. Back pressure in the system shall not effect the proper functioning of any system component.

9.2 Systems using hydraulic motors shall have a design pressure of sufficient magnitude for the intended use.

9.3 Systems with piston- or diaphragm-type hydraulic operators shall have a design pressure equal to the design pressure of the piston or diaphragm and shall have relief valve protection.

9.4 The hydraulic fluid used shall have a flashpoint of not less than 199.4°F (93°C) for pressures below 150 lb/in.² (10.3 bar) and 316.4°F (158°C) for pressures of 150 lb/in.² and above.

9.5 The hydraulic fluid shall be suitable for operation of the system through the entire temperature range to which it may be subjected in service.

9.6 Motors shall be installed directly on valves or through a gear system to produce the necessary valve speed or torque.

9.7 Pumps and control cocks at remote operating stations shall be mounted on panels with the reservoir tank located above the suction of the pumps. Four-way plug cocks shall be arranged to transit pressure for opening and closing the valves. Cocks shall have a neutral position to allow for expansion of operating oil that may be trapped in the system and to prevent inadvertent operation.

9.8 The minimum number of pumps at a remote operating station for a system shall be in accordance with Table 2.

9.9 Multiple pumps shall be connected in parallel.

---

Standard Specification for Doors, Double, Gastight/Airtight, Individually Dogged, for Marine Use

This standard is issued under the fixed designation F 1068; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification, to be used in conjunction with Specification F 1073, covers the principal dimensions and the mechanical requirements for manufacturing steel and aluminum individually dogged, airtight/gastight double doors for personnel access through bulkheads, complete with frames, intended to maintain the structural and the air and gas tightness integrity of the bulkheads.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following precautionary caveat pertains only to the Test Methods portion, Section 6, of this specification: This standard does not purport to address the safety concerns associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
   A 36/A 36M Specification for Carbon Structural Steel
   A 131/A 131M Specification for Structural Steel for Ships
   B 209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
   F 1073 Specification for Door Fittings, for Watertight/Gastight/Airtight, Weathertight, and Non-Tight Doors, for Marine Use

2.2 ABS Standard:
   Rules for Building and Classing Steel Vessels

2.3 Military Standards:
   MIL-R-900 Rubber Gasket Material, 45 Durometer Hardness
   MIL-C-81706 Coating, Aluminum and Aluminum Alloys
   MIL-P-24441 Epoxy-Polyamide Paint
   DoD-STD-2138 Metal Sprayed Coating System for Corrosion Protection
   TT-E-490 Enamel, Silicone Alkyd Copolymer, Semi-Gloss, Exterior
   ZZ-R-765 Rubber, Silicone

3. Ordering Information

3.1 Ordering for doors under this specification shall include the following:
   3.1.1 Material of doors,
   3.1.2 Nominal and ASTM designations, fixed lights or no lights,
   3.1.3 Quantity, and
   3.1.4 Location of active and inactive panels.

3.2 Inspection and acceptance of doors shall be agreed upon between the purchaser and the supplier.

4. Construction, Shape, and Dimensions

4.1 The construction, shape, and clear opening dimensions shall be as shown in Fig. 1 and Table 1; in addition, they shall conform to the following requirements:
   4.1.1 Door frames shall be supplied as indicated in Fig. 1. The corner radius inside of door frame shall be 8 in. (203 mm).
   4.1.2 Dogs shall be located on the door panels unless otherwise specified.
   4.1.3 The doors shall be fitted with dogs, hinges, hasp and staple assemblies, grab handles, label plates, and hook assemblies.
   4.1.4 The position of the grab handles shall be located at the center of the height of each door panel.
   4.1.5 The components shall be attached to the steel doors. Components shall be attached to aluminum doors by either welding or bolting.
   4.1.6 The material of standard door components shall be as given in Table 2.
4.1.7 Welding shall be done in accordance with ABS Rules for Building and Classing Steel Vessels.

5. Workmanship, Finish, and Appearance

5.1 All sharp and ragged edges shall be ground flush and removed for personnel protection.

5.1.1 The door panels, upon completion, shall be straight with a tolerance of $\pm \frac{1}{16}$ in. (1.6 mm).

5.2 Pretreatment and priming of door components shall be as follows:

5.2.1 Steel door and components, except component No. 3, are to be coated with inorganic zinc rich primer, SSPC Paint 20 Type I-C, at 1.5 to 3.0 mils (MDFT), both sides, before assembly, following surface preparation in accordance with the manufacturer’s instructions.

5.2.2 Aluminum door and components, except component No. 3, are to be pretreated with vinyl wash primer coating, followed with lead free, chromate free, anti-corrosion prime coating. Pretreatment and primer are to be applied before
assembly, following surface preparation in accordance with the manufacturer’s instructions.

6. Test Methods

6.1 Design all doors with their respective fittings from the inside (stiffener side) to a test head of 5 psi (34 kPa) and a proof test of 7.5 psi (50 kPa) to ensure no deformation of the panel.

6.2 Before delivery certify the doors for gastight/airtight integrity.

7. Product Marking

7.1 Each door shall be marked with the purchase order number by attaching a CRES label plate to the door panel using letters at least 1⁄2 in. (13 mm) high, designating the ASTM designation number, nominal number, thickness of the door plate, and direction of opening. Other markings may be in paint.

7.2 Label plates shall be screwed or bolted to the door panel on steel and aluminum doors, but in no way adversely affect the airtightness or gas tightness.

8. Packaging and Package Marking

8.1 Doors shall be crated or attached to a pallet in a manner acceptable for shipment by a common carrier. The door and door frame assembly shall be shipped as one unit with the gasket protected from knife edges by an inserted partition.

9. Keywords

9.1 airtight; dogged; doors; double doors; gastight; marine; ship

**SUPPLEMENTARY REQUIREMENTS**

The following supplementary requirements shall apply only when specified by the contract or order.

**S1. Painting**

S1.1 Pretreatment and priming of door components shall be metal spray coating in accordance with DoD-STD-2138, Type II on both sides prior to assembly.

S1.2 Aluminum door and components shall be treated with a chemical conversion coating MIL-C-81706, second primed with one coat epoxy polyamide primer (Formula 150 of MIL-P-24441) alkyd haze-gray (TT-E-490 or equal). Apply coating before assembly, following surface preparation in accordance with the manufacturer’s instruction.

**S2. Internal Pressure**

S2.1 Design and proof test pressures other than 5 and 7.5 psi (34 and 52 kPa), respectively, if required, shall be indicated.

S2.2 Clear openings other than those specified in Table 1, if required, shall be indicated.
S3. Special Heat Resisting Gaskets
   S3.1 Special heat resisting gaskets in accordance with ZZ-R-765, Class 3B, Grade 30 are to be installed.

S4. Aluminum Doors
   S4.1 Aluminum doors for 5 psi (34 kPa) internal and external pressures are to be indicated.

S5. Additional Test Requirements
   S5.1 Test requirements, when indicated, shall allow 1 out of 50 doors to be tested for 1.5 times the test requirements performed by the manufacturer.
Standard Specification for Doors, Watertight, Gastight/Airtight and Weathertight, Individually Dogged, for Marine Use

This standard is issued under the fixed designation F 1069; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification, to be used in conjunction with Specification F 1073, covers the principal dimensions and the mechanical requirements for manufacturing steel, aluminum, and glass-reinforced plastic, individually dogged, watertight, gastight/airtight, and weathertight doors, for personnel access through bulkheads, complete with frames, for marine use intended to maintain the structural and tightness integrity of bulkheads.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following safety hazards caveat pertains to the test method portion, Section 8, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
A 36/A36M Specification for Carbon Structural Steel²
A 131/A131M Specification for Structural Steel for Ships²
B 209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate³
F 1073 Specification for Door Fittings, for Watertight/Gastight/Airtight, Weathertight, and Non-Tight Doors, for Marine Use⁴
2.2 ABS Standard:
Rules for Building and Classing Steel Vessels⁵
2.3 Military Standards:
MIL-R-900 Rubber Gasket Material (45 Durometer Hardness)⁶
MIL-R-21607 Resins, Polyester Low-Pressure Laminating Fire Retardant⁶
MIL-P-17549 Plastic Laminates, Fibrous Glass Reinforced⁶
MIL-G-17927 Gaskets, Glass-Metallic Cover, Silicone Core⁶
MIL-C-81706 Coating, Aluminum and Aluminum Alloys⁶
MIL-P-24441 Epoxy-Polyamide Paint⁶
DoD-STD-2138 Metal Sprayed Coating Systems for Corrosion Protection⁶
TT-E-490 Enamel Silicone Alkyd Copolymer, Semi-gloss Exterior⁶

3. Classification

3.1 The doors shall be classified into groups as given in Table 1, according to their application; in addition, the length “L” shall be in accordance with the ABS Rules for Building and Classing Steel Vessels.

3.2 The doors shall be of two types. Type I doors shall conform to all dimensions, scantlings, and details of this specification. Type II doors shall be to special openings conforming to the test methods of this specification and scantlings indicated in Figs. 1-4. Special built doors with more than 9 psi (62 kPa) shall be indicated in the ordering information (see Supplementary Requirements).

3.2.1 Tolerances of all doors shall be ±1/8 in. (3 mm).

3.3 Where structural fire protection requirements are applicable, the doors shall meet the same requirements as required for the bulkheads in which fitted.

4. Ordering Information

4.1 Orders for doors, under this specification, shall include the following:
4.1.1 Group (see Table 1), type of material and dimensions (see Tables 2-5 inclusive) of doors,
4.1.2 Nominal and ASTM designations indicating fixed lights or no lights,
4.1.3 Quantity of each hand of door (right hand/left hand),
4.1.4 Test head to be indicated when Type II door is
required, and
4.1.5 Hasp and staple assemblies.

4.2 Inspection and acceptance of doors shall be agreed upon
between the purchaser and the supplier.

5. Materials and Manufacture

5.1 The materials and specifications shall be as shown in
Table 5.

5.2 Glass-reinforced plastic (GRP) material of doors and
frames shall meet the requirements of MIL-P-17549, Grade 1.
In addition, laminate must have the flammability limits equal to
the requirements for Grade 2, Class A, of MIL-R-21607.

5.2.1 All GRP material that is drilled, cut, and sanded,
leaving the surface exposed, shall be sealed with the same resin
as the exposed material.

6. Construction, Shape, and Dimensions

6.1 The construction, shape, and clear opening dimensions
shall be as shown in Table 2, Table 3, Table 4, and Fig. 1, Fig.
2, and shall also conform to the following:

6.1.1 A right-hand opening door shall be construed as one
that opens toward you with hinges located on right side of door.
A left-hand opening is similar but with hinges on the left.

6.1.2 Door frames shall be supplied as indicated in Fig. 4.
The corner radius, inside of door frame, shall be 8 in. (203
mm).
6.1.3 Dogs shall be located on the door panels unless otherwise specified. To hold dogs in open position, steel wedges or equivalent shall be welded to the panels.

6.1.4 Doors shall be fitted with dogs, hinges, grab handles, label plates, and hook assemblies; for details, see Specification F 1073.

6.1.5 Doors shall be fitted with hasp and staple assemblies if so specified by the purchaser in the ordering information.

6.1.6 The material for the standard door components shall be as shown in Table 5.

6.1.7 Welding shall be done in accordance with the Rules of the American Bureau of Shipping (indicated in Section 30).

7. Workmanship, Finish, and Appearance

7.1 All sharp and ragged edges shall be ground flush and removed for personnel protection.

7.2 Pretreatment and priming of door components shall be as follows:

7.2.1 Steel door and components shall be coated with inorganic zinc-rich primer SSPC Paint 20 Type I-C at 1.5 to 3.0 mil (MDFT) both sides, before assembly, following surface preparation in accordance with the manufacturer’s instructions.

7.2.2 Aluminum door and components are to be pretreated with wash primer coating followed with lead-free, chromate-free, anticorrosion prime coating. Pretreatment and primer are to be applied before assembly, following surface preparation, in accordance with the manufacturer’s instructions.

7.2.3 GRP door and components are to have color tint “haze gray” painted upon completion of the molding process.

8. Test Methods

8.1 Design all steel watertight doors with their respective fittings to an internal pressure of 9 psi (62 kPa). Watertight aluminum and GRP doors shall be 5 psi (34 kPa). Design gastight/airtight doors to an internal pressure of 2 psi (14 kPa).

8.2 Before delivery, certify the doors applicable to watertight, airtight, or weathertight integrity.

9. Product Marking

9.1 Each door shall be marked with the purchase order number by attaching a CRES label plate to the door panel using letters at least ½ in. (12.7 mm) high, indicating the ASTM designation number, class, nominal number, thickness of door plate, and direction of opening. Other markings may be in paint.

9.2 Label plates shall be screwed or bolted to the door panel on steel and aluminum doors, but in no way adversely affect the watertightness.

9.3 GRP door label plates shall be affixed to the door, with epoxy.

10. Packaging and Package Marking

10.1 Doors shall be crated or attached to a pallet in a manner acceptable for shipment by a common carrier. The door and door frame assembly shall be shipped as one unit with gasket protected from knife edge by an inserted partition.

11. Keywords

11.1 airtight; bulkheads; doors; gastight; marine; ship; tightness integrity; watertight; weathertight

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the contract or order

S1. Painting

S1.1 Pretreatment and priming of door components shall consist of metal spray coating in accordance with DoD-STD-2138, Type II on both sides before assembly.

S1.2 Aluminum door and components shall be treated with a chemical conversion coating MIL-C-81706, followed with a second coat of epoxy polyamide primer (Formula 150 of MIL-P-24441) alkyd haze gray (TT-E-490 or equal). Coating to be applied before assembly, following surface preparation, in accordance with the manufacturer’s instruction.

S2. Internal Pressure

S2.1 Internal pressure of more than 9 psi (62 kPa) and any other clear openings of door are to be indicated.

S3. Special Heat-Resisting Gaskets

S3.1 Special heat-resisting gaskets in accordance with MIL-G-17927 are to be indicated.

S4. GRP and Aluminum Doors

S4.1 GRP and aluminum doors for 5-psi (34-kPa) internal and 9-psi (62-kPa) external pressures are to be indicated.

S5. Additional Test Requirements

S5.1 Test requirements when indicated, shall allow 1 door out of 50 doors to be tested for 1.5 times the test requirements performed by the manufacturer.

S6. Door Frames

S6.1 Door frames when specified, may be 3- by 2-in. (76- by 50-mm) angles when dogs are located on the doors.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.
Standard Specification for
Doors, Non-Tight, for Marine Use

This standard is issued under the fixed designation F 1070; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification to be used in conjunction with Speci-

fication F 1073, covers the principal dimensions and the

mechanical requirements for manufacturing steel, aluminum,

and glass-reinforced plastic non-tight, personnel doors and
dutch doors, with the exception of joiner, joiner dutch doors,

and expanded metal doors, for marine use.

1.2 The doors will be used in non-tight bulkheads.

1.3 When fire protection requirements are applicable to the

location of these doors, then the use of aluminum and glass-

reinforced plastic doors shall be unacceptable.

1.4 The values stated in inch-pound units are to be regarded

as the standard. The values given in parentheses are for

information only.

3. Ordering Information

3.1 Ordering for doors under this specification shall include

the following:

3.1.1 Type of door and material (see Table 1 and Figs. 1-3),

3.1.2 Nominal and ASTM designations,

3.1.3 Quantity, hand of door (right hand or left hand, or

both), and

3.1.4 Optional items, such as fixed lights, door locks, to be

indicated.

3.2 Inspection and acceptance of doors shall be agreed upon

between the purchaser and the supplier.

4. Materials and Manufacture

4.1 The materials and specifications shall be as given in

Table 1.

4.2 Glass-reinforced plastic (GRP) material of doors shall

meet the requirements of MIL-P-17549, Grade 1. In addition,
laminate must have the flammability limits equal to the

requirements for Grade 2, Class A of MIL-R-21607.

5. Construction, Shape, and Dimensions

5.1 The construction, shape, and clear opening dimensions

shall be as shown in Tables 1 and 2 and Figs. 1-3 and conform

to the following requirements:

5.1.1 A right-hand opening door shall be construed as one

that opens towards you with hinges located on right side of

door. A left-hand opening is similar but with hinges on the left.

5.1.2 The size of the door opening and shape shall be as

given in Table 2.

5.1.3 Figs. 1 and 2 show the right-hand opening, and in the
case of left-hand opening, the arrangement of fittings shall be

reversed.

5.1.4 The position of the grab handles shall be located on

the center of the height of both sides of the door; in the case of
dutch doors, the location of the grab handles shall be suitably

positioned in the top panel.
5.1.5 The material of the standard door components shall be as shown in Table 1.

5.1.6 Doors shall be fitted with dogs, hinges, hasp and staple assemblies, grab handles, label plates, and hook assemblies; for details, see Specification F 1073.

5.1.7 Welding shall be done in accordance with the Rules of American Bureau of Shipping.

6. Workmanship, Finish, and Appearance

6.1 All sharp and ragged edges shall be ground flush and removed for personnel protection.

6.2 Pretreatment and priming of door components shall be as follows:
6.2.1 Steel doors and components shall be coated with inorganic zinc-rich primer SSPC Paint 20 Type I-C at 1.5 to 3.0 mil (MDFT), both sides before assembly, following surface preparation in accordance with the manufacturer’s instructions.

6.2.2 Aluminum doors and components are to be pretreated with wash primer coating followed with lead-free, chromate-free, anticorrosion prime coating. Pretreatment and primer are to be applied before assembly, following surface preparation, in accordance with the manufacturer’s instructions.

**Note:**
- 1 in. = 25.4 mm.
6.2.3 GRP doors and components are to have color tint “haze gray” painted upon completion of the molding process.

7. Product Marking

7.1 Each door shall be marked with the purchase order number by attaching a CRES label plate to the door panel using letters at least ½ in. (12.7 mm) high, indicating the ASTM designation number, nominal number, thickness of door plate, and direction of opening. Other markings may be in paint.

7.2 Label plates shall be screwed or bolted to the door panel on steel and aluminum doors.

7.3 GRP door label plates shall be affixed to the door with epoxy.

8. Packaging and Package Marking

8.1 Doors shall be crated or attached to a pallet in a manner acceptable for shipment by a common carrier. The door and door frame assembly shall be shipped as one unit, with gasket protected from knife edge by an inserted partition.

9. Keywords

9.1 doors; dutch doors; marine; non-tight doors; personnel doors; ship

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the contract or order.

S1. Pretreatment and Priming of Door Components

S1.1 Pretreatment and priming of door components shall consist of metal spray coating in accordance with DoD-STD-2138, Type II, on both sides before assembly.

S2. Aluminum Doors and Components

S2.1 Aluminum doors and components shall be treated with a chemical conversion coating MIL-C-81706, followed with a second coat of epoxy polyamide primer (Formula 150 of MIL-P-24441) alkyd haze gray (TT-E-490 or equal). Coating to be applied before assembly, following surface preparation, in accordance with the manufacturer’s instruction.
1. Scope

1.1 This specification covers steel expanded-metal bulkhead panels suitable for use in storerooms, shops, and as protection against personnel hazards.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:
   A 36/A 36M Specification for Carbon Structural Steel
   D 3951 Practice for Commercial Packaging

2.2 Other Documents:
   ABS Rules for Building and Classing Steel Vessels
   AWS D1.1 Structural Welding Code

3. Classification

3.1 Bulkhead panels are furnished in three types as follows.
   3.1.1 Type I—Universal bulkhead panels for use as either a right-hand or left-hand panel.
   3.1.2 Type II—Right-hand bulkhead panel.
   3.1.3 Type III—Left-hand bulkhead panel.

3.2 Bulkhead panels are furnished in two classes as follows.
   3.2.1 Class A—Bulkhead panels, 2 ft (610 cm).
   3.2.2 Class B—Bulkhead panels, 3 ft (915 cm).

3.3 Bulkhead panels Types II and III, Class A only, are furnished in three sizes as follows.
   3.3.1 Size 1—76 in. (195 cm) high.
   3.3.2 Size 2—64 in. (165 cm) high.
   3.3.3 Size 3—40 in. (100 cm) high.

4. Ordering Information

4.1 Orders for expanded-metal panels under this specification shall include this specification number, type, class, and size.

5. Materials and Manufacture

5.1 Materials:

5.2 Manufacture:
   5.2.1 Welding shall be in accordance with AWS D1.1 or the ABS Rules for Building and Classing Steel Vessels.
   5.2.2 Panels shall be welded and fabricated as shown in Figs. 1-6.
   5.2.3 After panels have been shipped to the contractor, the panels will be assembled into bulkheads by welding or bolting by others.

6. Tolerances

6.1 Tolerances—±1/16 in. (1.5 mm).

7. Workmanship, Finish, and Appearance

7.1 Expanded-metal panels shall be free from all cracks, burrs, sharp edges, and other defects.

7.2 The panel manufacturer shall apply a nonhazardous corrosion-inhibiting primer coating to all panel assemblies.

8. Packaging and Package Marking

8.1 Expanded-metal bulkhead panels shall be individually packed for shipment and storage in accordance with Practice D 3951.

8.2 In addition to any special marking required by the contract or purchase order, each expanded-metal panel package shall be marked in accordance with Practice D 3951.

9. Keywords

9.1 bulkhead panels; expanded-metal bulkhead panels; panels; steel bulkhead panels

   F 783 Specification for Staple, Handgrab, Handle, and Stirrup Rung

2.2 Other Documents:
   ABS Rules for Building and Classing Steel Vessels
   AWS D1.1 Structural Welding Code

3. Classification

3.1 Expanded-metal doors are furnished in four types (see Detail “J”) as follows:
   3.1.1 Type I—Right hand (RH).
   3.1.2 Type II—Left hand (LH).
   3.1.3 Type III—Right hand reverse (RHR).
   3.1.4 Type IV—Left hand reverse (LHR).

4. Ordering Information

4.1 Orders for doors under this specification shall include the classification and type.

5. Materials and Manufacture

5.1 Materials—See Table 1.
5.2 Manufacture:
   5.2.1 Doors shall be furnished with the vertical support channels and top angle in place. A temporary brace shall be included at the frame bottom to prevent racking.
   5.2.2 Welding shall be in accordance with AWS D1.1 Structural Welding Code or ABS Rules for Building and Classing Steel Vessels.

6. Installation Requirements

6.1 Doors shall be fitted with rubber-tipped bumpers and a manually operated catch for holding doors in an open position. These shall be furnished and installed by others.

6.2 Provision shall be made for the installation of a rim latch set operated by knobs on both sides. This hardware shall be furnished and installed by others.

6.3 Padlocks shall be furnished by others.

6.4 Any holes needed in the frame for installation in expanded-metal or other types of bulkheads shall be made at installation by others.

7. Dimensions and Tolerances

7.1 Dimensions are as indicated in Figs. 1-8 and Table 1.
7.2 Tolerance—± 1/16 in. (1.5 mm).

8. Workmanship, Finish, and Appearance

8.1 Doors and frames shall be free from all cracks, burrs, sharp edges, and other defects.

8.2 The door manufacturer shall apply a nonhazardous corrosion-inhibiting primer coating to all door assemblies.

9. Packaging and Package Marking

9.1 Each expanded-metal door shall be individually packed for shipment and storage in accordance with Practice D 3951.

9.2 In addition to any special marking required by the contract or purchase order, each expanded-metal door shall be marked in accordance with Practice D 3951.

FIG. 8 Installation Details

Note: 1 in. = 25.4 mm.
Standard Specification for Door Fittings, for Watertight /Gastight /Airtight, Weathertight, and Non-Tight Doors, for Marine Use

This standard is issued under the fixed designation F 1073; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the principal design and type of material for manufacturing fittings for watertight/gastight/airtight, weathertight, and non-tight doors, for marine use. Note that “gastight” is commercial terminology which also means “airtight” in naval terminology.

1.2 The fittings are intended for use on all doors for marine use, except joiner and expanded metal doors.

2. Referenced Documents

2.1 ASTM Standards:

- A 36/A36M Specification for Carbon Structural Steel
- A 240/A 240M Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels
- A 276 Specification for Stainless and Heat-Resisting Steel Bars and Shapes
- A 563 Specification for Carbon and Alloy Steel Nuts
- A 668 Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use
- B 140/B 140M Specification for Copper-Zinc-Lead Red Brass or Hardware Bronze Rod, Bar and Shapes
- B 210 Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes

2.2 Military Standards:

- MIL-P-24441 Epoxy-Polyamide Paint
- MIL-P-17578A Packing Material, Plastic (for Dogs for Watertight Closures) (Symbol 1425)
- MIL-C-81706 Coating, Aluminum and Aluminum Alloys
- DOD-STD-2138 Metal Sprayed Coating Systems for Corrosion Protection

2.3 Federal Specifications:

- QQ-C-390 Copper Alloy Castings
- TT-E-490 Enamel-Silicone Alkyd Copolymer, Semi-gloss, Exterior

2.4 ANSI Standard:

- A2.6 Standard for Fire Tests of Window Assemblies

2.5 AISI Standard:

- 316 Low Alloy Stainless Steel (Cres 316)

3. Classification

3.1 The dogs and hinges shall be classified as given in Table 1.

4. Ordering Information

4.1 Ordering for fittings shall be indicated on the purchase order prepared for doors, with reference to this specification noted.

4.2 When ordering fittings, indicate the following:

- 4.2.1 Type,
- 4.2.2 Quantity,
- 4.2.3 Marking (see Section 8), and
- 4.3 Inspection and acceptance of fittings shall be agreed upon between the purchaser and the supplier.

5. Materials and Manufacture

5.1 The material shall be as specified in Tables 2-4.

5.2 All securing screws and fasteners shall be of stainless steel, Type 316.
5.3 All glazing in portlights of fire door shall meet ANSI A2.6.

6. Construction, Shape, and Dimensions

6.1 The construction, shape, and dimensions for dogs and hinges shall be as shown in Figs. 1-9.

6.2 Door dogs shall be supplied with hold-open clips.

7. Workmanship, Finish, and Appearance

7.1 All materials shall have a smooth finish.

7.2 Pretreatment and priming of door fittings shall be as follows:

7.2.1 Mild steel fittings shall be abrasive blasted to “near white” metal and coated with inorganic zinc silicate at 1.5 to 3.0 mils.

7.2.2 Steel fittings, secured on doors, shall be welded to steel; whereas aluminum fittings when secured to aluminum or glass-reinforced plastic doors, shall be welded or bolted into position.

7.2.3 Nonferrous fittings shall be either riveted or bolted to aluminum, steel or glass-reinforced plastic doors, or combination thereof.

7.2.4 Where different metals are to be used, insulation shall be used between them, in way of contact, to prevent galvanic action.

8. Product Marking

8.1 Each fitting shall be marked with its purchase order number and shall indicate the type of fitting, left hand or right hand. The marking shall be applied on a waterproof tag and attached to the fitting.

9. Keywords

9.1 airtight; door fittings; doors; gastight; marine; non-tight; ship; tightness integrity; watertight; weathertight

FIG. 8 Hasp and Eye Assembly “A”
SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall apply only when specified by the contract or order.

S1. Painting

S1.1 Pretreatment and priming of mild steel door components shall consist of metal spray coating in accordance with DOD-STD-2138, Type II on both sides before assembly.

S1.2 Aluminum door components shall be treated with a chemical conversion coating MIL-C-81706, followed with a second coat of epoxy polyamide primer (formula 150 of MIL-P-24441) alkyd haze gray (TT-E-490) or equal. Coating to be applied before assembly, following surface preparation, in accordance with the manufacturer’s instructions.

S1.3 Special heat resisting gaskets, in accordance with MIL-P-17578A, are to be used.

NOTE — 1 in. = 25.4 mm.

FIG. 9 Hinge Assembly for Aluminum Doors
Standard Specification for Cleats, Welded Horn Type

This standard is issued under the fixed designation F 1074; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers hollow cleats and pads for marine use.

1.2 The cleats shall be used where securing of boat handling lines are required onboard commercial and navy boats and crafts.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:

A 36/A 36M Specification for Carbon Structural Steel

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

A 385 Practice for Providing High-Quality Zinc Coatings (Hot-Dip)

3. Ordering Information

3.1 Orders for material under this specification shall include the following:

3.1.1 Title, number, and date of this specification,

3.1.2 Quantity,

3.1.3 Size of cleats, and

3.1.4 Packaging, packing, or marking requirements.

4. Materials and Manufacture

4.1 Material:

4.1.1 The horn cleats shall be of galvanized steel, grade 1023W, in accordance with Practice A 385.

4.1.2 The base plate shall be of steel, (carbon 0.35 maximum), in accordance with Specification A 36/A 36M.

4.1.3 All chafing surfaces shall have a 125µ finish.

4.2 Manufacture—The cleats’ horns shall be of cast steel, round in shape, and free of burrs or sharp edges. The horns shall be welded to a base plate as shown in Fig. 1 (see Table 1). The weld is to be ground smooth to prevent chafing of ropes. The base plate shall be oval shaped with smooth rounded edges. The dimensions shall be in accordance with Table 1.

5. Packaging

5.1 The packing shall afford protection against deterioration and physical damage during shipment from the manufacturer to the using activity for immediate use.

6. Product Marking

6.1 Containers shall be stenciled with the ASTM standard designation, in black paint with approximately 1 in. (25.4 mm) high letters and numbers with the following information:

6.1.1 Address,

6.1.2 purchase order number, and

6.1.3 Manufacturer’s name.

7. Keywords

7.1 base plates; boat handling lines; cleats; hollow cleats; horn cleats; marine; marine cleats; ship; welded cleats

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall apply only when specified by the purchaser in the contract or order.

S1.1 Responsibility for Inspection—The purchaser reserves the right to perform any of the inspections set forth in the specification where such inspections are deemed necessary to assure that supplies and services conform to prescribed requirements.

S1.2 Source Inspection—The purchaser reserves the right to inspect the manufacturing process and end product in the supplier’s plant.

S1.3 Tests—The cleats shall meet the test load requirements of Table 1, as tested in accordance with Test Methods and Definitions A 370.
Standard Specification for
Dehumidifier, Shipboard, Mechanically Refrigerated, Self-Contained

1. Scope
1.1 This specification covers self-contained dehumidifiers using hermetic refrigerant motor-compressors.
1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.
1.3 The following safety hazards caveat pertains only to the test methods portion, Section 11, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents
2.1 ASTM Standards:
   B 117 Practice for Operating Salt Spray (Fog) Apparatus
   B 280 Specification for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service
   D 1654 Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments
   D 2247 Practice for Testing Water Resistance of Coatings in 100 % Relative Humidity
2.2 ASHRAE Standard—15 Safety Code for Mechanical Refrigeration
2.3 Official Classification Standard:
   MIL-S-901 Specification Requirements for Shock Tests, High Impact (H.I.); Shipboard Machinery, Equipment, and Systems
   MIL-STD-167-1 Mechanical Vibrations of Shipboard Equipment, (Type I—Environmental and Type II—Internally Excited)
   MIL-D-19947 Specification for Dehumidifier, Space, Mechanically Refrigerated, Self-Contained, Naval Shipboard

3. Ordering Information
3.1 Orders for products under this specification shall include the following information, as necessary, to describe adequately the desired product:
   3.1.1 Title, ASTM designation, and year of issue,
   3.1.2 Quantity (number of dehumidifiers),
   3.1.3 Certification if required, and
   3.1.4 Additions to the specification and supplementary requirements, if required.

4. Materials and Manufacture
4.1 In addition to the requirements cited in this specification, the dehumidifiers covered by this specification shall be designed, constructed, assembled, and tested to comply with UL 474, UL 984, and ASHRAE Standard 15. In the event of differences between any of the requirements of this specification and those of other referenced documents, the requirements of this specification shall govern. The manufacturer shall certify compliance with the above standards for equipment furnished and shall be cited in the UL Electrical Appliance and Utilization Equipment product directories.

4.2 The dehumidifier shall consist of a motor-compressor, condensing unit, dehumidifying coil, air-circulating fan, and accessories, all enclosed within a metal cabinet. The dehumidifier shall be complete, self-contained with the refrigeration

equipment dehydrated, and charged with the necessary operating quantity of refrigerant and oil. Each unit shall be ready for operation after removal of shipping protection, opening of valves where provided, and connection to electric power.

4.3 The motor-compressor shall be of the hermetic type and shall consist of a compressor and motor enclosed in a gastight shell. The hermetic compressor unit shall conform to UL 984 and shall be at least 3/4 hp. Equipment shall operate on 115-V, single-phase, 60-cycle alternating current. The unit shall be protected against overload by a thermal protector built into the motor. The thermal protection shall be either the manual or automatic reset type.

4.4 Piping necessary for the satisfactory operation of the equipment shall be provided by the manufacturer. Tubing shall be made of copper in accordance with Specification B 280. Piping connections shall be arranged in such a manner so as not to impair the vibration-isolation properties of absorption-type mounts, where such mounts are provided. Piping shall be securely supported to minimize strain and vibration. Piping connections shall not be made of soft solder.

4.5 Materials used in the manufacture of the equipment shall be corrosion-resistant or treated to resist corrosion. The method of manufacture shall not impair physical, structural, or corrosion-resistant properties of the components. Materials, coatings, and paint systems shall satisfactorily pass the applicable salt spray and humidity test specified in this specification.

4.6 Bolts, nuts, studs, pins, screws, and such other fastenings or fittings shall be of a corrosion-resistant material, or of a material treated in a manner to render it adequately resistant to corrosion. Screws exposed in final assembly shall be corrosion-resistant material.

4.7 Similar parts, including repair parts, or corresponding apparatus furnished on the same contract or order, or built to the same drawings, shall be strictly interchangeable without the necessity of further machining or hand fitting of any kind.

4.8 A plastic or other chemically inert container shall be provided for collecting the condensate. The container shall be of a size and configuration that will fit within the cabinet enclosure. The container shall be provided with baffles to prevent the overflow or spilling of water and shall be readily removable from the dehumidifier cabinet. A male fitting shall be provided from the container for connection of a 0.375-in. (10-mm) inside diameter flexible rubber tubing for draining the condensate (wall thickness 0.125 in. (3 mm)). The rubber tubing will not be required to be furnished by the contractor.

4.9 Provision shall be made in the frame to permit securing the cabinet to any appropriate surface.

4.10 Identification plates shall be of a nonferrous metal or corrosion-resistant steel and shall conform to UL 474.

5. Performance Requirements

5.1 The unit shall be capable of condensing at least 1.8 gal (7 L) of water in 24 h at an ambient temperature of 90°F (32°C) dry bulb and 60% relative humidity.

5.2 The unit shall operate satisfactorily in a maximum ambient temperature of 110°F (43°C) and a minimum relative humidity of 30%. Under these conditions of maximal load, the temperature rise of the hermetic motor shall not exceed 158°F (70°C).

5.3 The equipment shall operate satisfactorily when inclined at an angle of 15° on each side of the vertical, in each of two vertical planes at right angles to each other.

6. Other Requirements

6.1 Design Documentation—A master drawing of a built configuration shall be provided for each of the following:

6.1.1 Complete dehumidifier,

6.1.2 Motor compressor,

6.1.3 Condenser, and

6.1.4 Fan and cooling coil.

6.1.5 Each master drawing shall show outline, mounting, attachment, and connection dimensions, including methods and sizes of fastenings and clearances for installation and servicing, plus supplementary data as necessary to permit installation without suppliers assistance. The drawing shall illustrate design, construction, operation (or function), and identity of parts. Where acceptance tests are required, the tests shall be identified, and approval authority and date shall be noted on the drawing. Subassembly drawings shall be provided to supplement master drawings where desirable.

6.2 Schematic Drawings:

6.2.1 Schematic drawings shall be provided that include all mechanical, piping and electrical circuits, and connections.

6.2.2 All symbols used for equipment components or parts shall be given a piece number and identified in the list of materials with the following information:

6.2.2.1 Piece number,

6.2.2.2 Quantity required,

6.2.2.3 Descriptive name,

6.2.2.4 Manufacturer,

6.2.2.5 Manufacturer’s model or identifying number,

6.2.2.6 Manufacturer’s drawing number, and

6.2.2.7 Weight.

6.3 Manuals—Manuals shall be typed in accordance with the manufacturer’s commercial practice. Photo views of the equipment shall be included as part of the general description. A section shall be provided containing reduced copies of all drawings required to amplify or illustrate the text including diagram and assembly drawings.

7. Workmanship, Finish, and Appearance

7.1 All materials forming a part of the finished product shall be new and suitable for the purpose intended. The materials shall be free from any defects that might affect the serviceability or appearance of the finished product.

7.2 Seal caps in the refrigerant system shall be provided with a gasket and shall be tight against any leaks.

7.3 Bolts, nuts, and screws shall be tight and equipment and parts shall be properly fastened and secured.

7.4 No parts or components shall be fractured, split, torn, dented, or otherwise defective.

7.5 The limiting and mounting dimensions shall be in accordance with the drawings.

7.6 There shall be no sharp or ragged edges that may be injurious to people.
8. Sampling

8.1 Sample units shall be selected from each lot offered for delivery, in accordance with Table 1 and subjected to the tests specified in 8.3.

8.2 If any unit fails in any test or is found nonconforming in any requirement, it shall be counted a defective unit, and if the number of such defective units in any sample exceeds the acceptance number shown in Table 1 for the sample, the lot represented by the sample will be rejected.

8.3 Quality Conformance Tests:

8.3.1 The units shall be operated for a period of at least 1 h under ambient atmosphere conditions. During the test, all refrigerant containing parts shall be leak tested by means of a halide leak detector and shall be free of any leaks. In the evidence of leakage, the unit shall be considered defective. The halogen leak detector shall have a leak index sensitivity of 1/2 oz per year (14 g per year).

8.3.2 Under equivalent ambient temperature, the electrical power input shall be measured and compared with the input of all other units that have been tested. If any unit requires 7% more power than the average of all the acceptable units, it shall be counted as a defective unit and shall only be offered for delivery after the cause has been found and corrected.

9. Number of Tests and Retests

9.1 A first unit shall satisfactorily pass the tests listed in 11.1-11.3 before production units are offered for delivery.

9.2 A test for the corrosion-resistant properties of the materials, coating, and painting system used, shall be carried out as specified in 11.4.

10. Specimen Preparation

10.1 Test specimens for the corrosion test shall be prepared by the manufacturer as required, and shall be of the same material used in the dehumidifier. The film thickness of the coating or paint system applied on the test specimen shall be the same as the film thickness used on the equipment.

11. Test Methods

11.1 Design Capacity Test—Install the unit in an ambient temperature of 90°F (32°C) and 60% relative humidity. Operate the unit for a period of 4 h. Under these conditions, the unit shall condense moisture at the rate of at least 1.8 gal (7 L) of water in 24 h. Record ambient temperature, relative humidity, and quantity of condensate at 20-min intervals.

11.2 Overload Test—Install the unit in an ambient temperature of 110°F (43°C) and not less than 30% relative humidity. The unit shall operate without tripping the compressor motor overload device or without breakdown. Continue the test until steady conditions have been observed for at least 4 h. Record ambient temperature, relative humidity, and voltage at service connection every 20 min. Determine the temperature of the compressor-motor winding at the end of the 4-h test period. The temperature rise shall not exceed 158°F (70°C). Measure and compute the temperature rise of the running winding in the compressor-motor by the resistance method.

11.3 Inclination Test—Incline the unit at an angle of 15° on each side of the vertical in each of two vertical planes at right angles to each other and operate at least 1 h in each plane with no abnormal variations in temperature. Collect and drain condensate from the evaporator into the container without any spillage in any of the inclined positions.

11.4 Corrosion Resistant Test—Test the test specimens in a corrosion environment in accordance with Practice B 117 (Salt Spray Apparatus) and Practice D 2247 (100% relative humidity test). The time duration of each test shall be 240 h. Evaluate the test specimens in accordance with Test Method D 1654. The rating number shall not be less than 6, and the rust creep shall not be greater than 1/8 in. (3 mm) normal to the scribe marks for acceptance.

12. Inspection

12.1 Unless otherwise specified in the purchase order or contract, the manufacturer is responsible for the performance of all inspection and test requirements specified in this specification. Except as otherwise specified in the purchase order or contract, the manufacturer may use his own or any other suitable facilities for the performance of the inspection and test requirements unless disapproved by the purchaser at the time the order is placed. The purchaser shall have the right to perform any of the inspections and tests set forth in this specification when such inspections and tests are deemed necessary to assure that the material conforms to the prescribed requirements.

13. Rejection

13.1 Material that fails to conform to the requirements of this specification when inspected or tested by the purchaser or his agent may be rejected.

14. Certification

14.1 When specified in the purchase order or contract, a manufacturer’s or supplier’s certification shall be furnished to the purchaser stating that the equipment was manufactured, sampled, tested, and inspected in accordance with this specification and has been found to meet the requirements. When specified in the purchase order or contract, drawings shall be provided that are sufficiently complete to reflect compliance with specification requirements for the equipment, and a report of the test results shall be furnished.

15. Packaging and Package Marking

15.1 Preservation and Packaging—Preservation and packaging shall be sufficient to afford adequate protection against
corrosion, deterioration, and physical damage during shipment from the supply source to the using activity and until installation and may conform to the suppliers commercial practice when such meets these requirements. Manuals furnished with basic equipment shall be packaged in sealed, waterproof containers.

15.2 **Packing**—Packing shall be accomplished in a manner that will ensure acceptance by common carrier at the lowest rate and will afford protection against physical or mechanical damage during direct shipment from the supply source to the using activity for early installation. The shipping containers or method of packing shall conform to the Uniform Freight Classification Rules and Regulations or other carrier regulations as applicable to the mode of transportation and may conform to the suppliers commercial practice when such meets these requirements.

**SUPPLEMENTARY REQUIREMENTS**

The following supplementary requirements are applicable to DoD procurements and shall apply only when specified by the purchaser in the contract or order.

**S1. Dimensions, Mass, and Permissible Variations**

**S1.1** **Size**—The unit shall permit passing through a circular opening 21 in. (530 mm) in diameter and a rectangular opening 18 by 30 in. (460 by 760 mm).

**S2. Design Requirements**

**S2.1** **Shock**—The dehumidifier shall be designed to meet shock requirements in accordance with MIL-S-901, for Grade B equipment.

**S2.2** **Vibration**—The dehumidifier shall be designed to withstand conditions in accordance with MIL-STD-167-1 for Type I and Type II vibration of shipboard equipment.

**S3. First Article Testing**

S3.1 A first unit shall satisfactorily pass the tests listed in S3.2 and S3.3 before production units are offered for delivery.

**S3.2** **Shock Testing**—A first unit shall be subjected to and shall meet Grade B shock requirements in accordance with MIL-S-901.

**S3.3** **Vibration Testing**—A first unit shall be subjected to and shall withstand vibration testing in accordance with MIL-STD-167-1 for Type I and Type II equipment.

**S4. First Article Test Report**

S4.1 A first article test report shall be submitted certifying compliance with the requirements specified in this specification.
Standard Practice for
Expanded Welded and Silver Brazed Socket Joints for Pipe
and Tube

This standard is issued under the fixed designation F 1076; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers expanded welded and silver brazed
socket joints for use on shipboard piping systems.

1.2 Expanded welded and silver brazed socket joints are to
be used to join two pipes or tubes having the same NPS (see
Note 1) without using a fitting or butt weld.

1.3 Brazed socket type joints are not intended for use on
systems containing flammable or combustible fluids in areas
where fire hazards exist or where the service temperature
exceeds 425°F (205°C).

1.4 Brazed joints depending solely upon a fillet weld rather
than primarily upon brazing material between pipe/tube and
socket are not covered by this practice.

Note 1—The dimensionless designator nominal pipe size (NPS) has
been substituted in this practice for such traditional terms as “nominal
diameter,” “size,” “nominal size,” and “iron pipe size.”

1.5 The values stated in inch-pound units are to be regarded
as the standard.

1.6 This standard does not purport to address all of the
safety concerns, if any, associated with its use. It is the
responsibility of the user of this standard to establish appro-
priate safety and health practices and determine the applica-
ibility of regulatory limitations prior to use.

Piping Systems

3. Significance and Use

3.1 Expanded welded socket joints may be used with the
following pipe and tube:

   3.1.1 Seamless Copper Tube—2.375-in. (60-mm) outside
diameter through 6.625-in. (170-mm) outside diameter.
   3.1.2 Seamless Copper-Nickel Tube—2.375-in. (60-mm)
outside diameter through 6.625-in. (170-mm) outside diameter.
   3.1.3 Seamless Copper Water Tube—2.125-in. (55-mm)
outside diameter through 4.125-in. (105-mm) outside diameter.
   3.1.4 Seamless Stainless Steel Pipe—2 NPS through 6 NPS,
Schedules 5 and 10.

3.2 Expanded silver brazed socket joints may be used with
the following pipe and tube:

   3.2.1 Seamless Copper Tube—2.375-in. (60-mm) outside
diameter through 6.625-in. (170-mm) outside diameter.
   3.2.2 Seamless Copper-Nickel Tube—2.375-in. (60-mm)
outside diameter through 6.625-in. (170-mm) outside diameter.
   3.2.3 Seamless Copper Water Tube—2.125-in. (55-mm)
outside diameter through 4.125-in. (105-mm) outside diameter.

3.3 Expanded welded and silver brazed socket joints may be
used where experience or test has demonstrated that the joint is
safe and suitable for design and operating conditions, and
where adequate provision is made to prevent separation of the
joint.

4. Materials and Manufacture

4.1 Welded Socket Joint:

---

1 This practice is under the jurisdiction of ASTM Committee F25 on Ships and
Marine Technology and is the direct responsibility of Subcommittee F25.11 on
Machinery and Piping Systems.

\(^2\) See 5.3.

5. Procedure

5.1 Install no more than two expanded joints in any 36-in. (915-mm) long section of pipe/tube and in no case allow a pipe/tube expanded at both ends in lengths of less than 36 in.

5.2 Fabricate expanded joints on the ends of the pipe/tube by use of an expanding machine.

5.3 Expanded joints shall not be used on Class I piping systems as defined in 46CFR56.04 for United States Coast Guard inspected and certified vessels.

5.4 Perform a minimum of three expansions to ensure the degree of expansion.

5.5 Bevel the unexpanded end of pipe/tube 30 to 40° for copper-nickel alloy and 10 to 20° for stainless steel.

5.6 Clean the pipe/tube ends to be inserted into the silver-brazed expanded pipe/tube socket and the interior of the socket itself to a bright metal before insertion.

5.7 Align pipe/tube ends concentrically as accurately as possible, and preserve this alignment during the welding process.

5.8 Provide a gap of approximately \(\frac{1}{6}\) in. (1.5 mm) (expanded welded socket joint, Fig. 1) and \(\frac{1}{4}\) in. (3 mm) (expanded silver-brazed joint, Fig. 2) between the end of the
pipe/tube and the bottom of the socket by bottoming the pipe/tube and backing off slightly before tacking.

5.9 The minimum insertion length shall be 1 in. (25 mm).

5.10 For United States Navy Application (see NAVSEA Document 0900-LP-001-7000), on the pipe/tube inserted into the expanded joint make a light scribe line a distance of 2 in. (50 mm) from the end of the unexpanded pipe/tube. This scribe line shall be visible at the time of final inspection.

5.11 The filler metal used in brazing shall be a nonferrous metal or alloy having a melting point above 1000°F (537°C) and below that of the metal being joined.

5.12 The brazing material shall have a shearing strength of at least 10 000 psi (68 950 KPa).

6. Dimensions and Tolerances

6.1 Dimensions are as indicated in Fig. 1.

6.2 The inside diameters of pipe/tube in socket joints must be aligned as accurately as practicable. Alignment must be preserved during welding.

6.3 Pipe/tube ends in socket joints shall provide a maximum radial clearance between pipe/tube outside radius and socket inside radius of the following:

6.3.1 Welded Socket Joints—0.012 in. (0.305 mm) maximum.

6.3.2 Silver-Brazed Joints—0.002 to 0.006 in. (0.050 to 0.150 mm).

6.4 Wall thickness thinning shall be less than 10 % for all sizes, and in no case shall the minimum wall thickness after expansion be less than the values for \( T_1 \) in Table 1.

7. Welding and Brazing

7.1 Welding shall be as shown on Fig. 1.

7.2 Brazing shall be as shown on Fig. 2.

7.3 Welding and brazing shall be in accordance with Section IX of the ASME Boiler Code.

8. Workmanship, Finish, and Appearance

8.1 Surface areas and pipe/tube ends shall be free of weld spatter, burrs, sharp corners, and edges hazardous to personnel.
1. Scope

1.1 This specification provides the requirements for mattresses and box springs that are for use in berths for officers, crew, and passengers in marine vessels. This shall be considered a minimum standard.

1.2 The values stated in inch-pound SI units are to be regarded as the standard (except where such units are not present, when discussing fire test methods), standard. The values given in parentheses, in SI inch-pound units, are for information only.

1.3 This standard is used to measure and describe the response of materials, products, or assemblies to heat and flame under controlled conditions, but does not by itself incorporate all factors required for fire-hazard or fire-risk assessment of the materials, products, or assemblies under actual fire conditions.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

4 Available from California Bureau of Home Furnishings and Thermal Insulation, 3483 Orange Grove Ave., North Highlands, CA 95660.

6 Available from NAVSEA, Naval Sea Systems Command, Dept. of Navy, 1333 Isaac Hull Ave., STOP 5149 (SEA 05P6), Washington Navy Yard, DC 20376-5149.
3. Terminology

3.1 **Definitions**—For definitions of terms used in this specification associated with textiles, see Terminology D 123. For definitions of terms used in this specification associated with fire issues, see Terminology E 176.

3.2 **Definitions of Terms Specific to This Standard**:

3.2.1 **border**, n—a material that forms the side panel that surrounds the perimeter of the mattress and defines its depth.

3.2.2 **box spring**, n—a foundation for a mattress, consisting of wire spring elements mounted on a frame, generally upholstered and covered on the top and sides with ticking, and on the bottom with a dust cover.

3.2.3 **box spring assembly**, n—an interconnection of coil springs, border wire, and top wire assembly contained within a box spring.

3.2.4 **flaming droplets**, n—drops of material exhibiting evidence of flames when falling—flaming molten or flaming liquefied droplets which fall from the test specimen during the fire test and that continues exhibiting evidence of flames for a period of at least 10 s—continue to burn.

3.2.5 **flange**, n—strip of material secured to the perimeter of an upholstery panel to secure to the innerspring core.

3.2.6 **innerspring unit**, n—an interconnection of wire spring elements other than mounting on a frame that forms a single unit that can be incorporated into a mattress.

3.2.7 **insulator pad**, n—one or more layers of a cushioning system between the upholstery and mattress core, which consist of foam or other cushioning or filling materials.

3.2.8 **mattress**, n—ticking filled with a resilient material used alone or in combination with other products intended or promoted for sleeping upon.

3.2.9 **mattress core**, n—the main support system that may be present in a mattress, such as springs, foam, or resilient filling.

3.2.10 **mattress, innerspring**, n—any mattress containing an innerspring unit.

3.2.11 **mattress, solid core**, n—any mattress containing padding, but not an innerspring unit.

3.2.12 **quilted, adj**—stitched with any thread or by fusion through the ticking and one or more layers of upholstery material.

3.2.13 **tape edge**, n—seam or border edge of a mattress.

3.2.14 **ticking**, n—the outermost layer of fabric or related material that encloses the core and upholstery materials of a mattress or mattress pad.

4. Ordering Information

4.1 Orders for items purchased under this specification shall define the following:

4.1.1 **Mattresses**—Quantity, dimensional requirements, type (solid core or innerspring), and weight per each size.

4.1.2 **Box Springs**—Quantity, dimensional requirements, and weight per each size.

4.1.3 Upholstery material selections are to be offered as choices by the manufacturer or distributor to the purchaser. The selection shall be of good quality suitable for commercial use and for use aboard U.S. Navy vessels.

4.1.4 When first article of inspection is required, it shall be spelled out in the paperwork.

5. Materials and Manufacture

5.1 **Innerspring Mattress**—The essential components of an innerspring mattress are: an innerspring core, cushioning, upholstery ticking (either quilted or with a smooth top, and potentially including a flange), and a border. Optional components include various insulating layers or pads, flanges, and tapes. All materials used shall meet the mechanical property and fire performance requirements of Table 1. All materials used shall comply with appropriate commercial bedding industry standards of manufacture and durability. Any construction of an innerspring mattress that is suitable for its intended use and that complies with the performance requirements shown herein shall be permitted to be used.

5.1.1 **Innerspring Core**—The innerspring core shall be constructed from an all-wire carbon steel. The coils shall extend the full length and width of the mattress. The coils shall be permanently secured to provide long-term structural stability. Various core designs shall be permitted. The support properties of the innerspring core, in terms of firmness rating, durability, resistance to impact, firmness retention, and surface deformation, shall be assessed by Test Methods F 1566. The coils, or the complete spring unit assembly, shall be given suitable thermal treatment to relieve residual stresses caused by coiling.

5.1.2 **Cushioning and Insulator Layers**—An insulator pad shall be placed over each sleeping surface of the innerspring core to insulate the upholstery from the core. The various cushioning layers shall be constructed of materials that meet the performance requirements of Table 1.

5.1.3 **Ticking and Cover Assembly**—The cover construction shall be suitable for the type of mattress construction used. Upholstery ticking materials shall be durable, per common bedding industry practices. The ticking for each sleeping surface shall

---

Footnote:

7 Available from National Fire Protection Association (NFPA), 1 Batterymarch Park, Quincy, MA 02269-9101.
be cut in one piece without fabric splices. The ticking for the mattress border shall be made of not more than two pieces of ticking, with the ends spliced and sewn together in a continuous manner leaving no gaps or voids in uniformity and finish. The border assembly shall be secured to the top and bottom sleeping surfaces of the mattress, by automatic sewing, per common bedding industry practices.

5.1.4 Border—The ticking for the mattress border shall be made of not more than two pieces of ticking, with the ends spliced and sewn together in a continuous manner leaving no gaps or voids in uniformity and finish. The border assembly shall be secured to the top and bottom sleeping surfaces of the mattress, by automatic sewing, per common bedding industry practices.

5.1.5 Tape—A tape shall be permitted to be used to conceal the seams formed between the border, if present, and an upholstery panel. The tape shall be continuously stitched along the total length of each seam, with no gaps or voids between the upholstery panel and border surfaces.

5.1.6 Seam and Stitching—The seam and stitch types shall be in accordance with Practice D 6193. All seams shall be securely stitched. Seams shall not slip or pull out.

5.1.7 Mattress—All mattress components shall meet the requirements of Table 1, as appropriate. The overall mattress shall meet the performance requirements of Table 2, as discussed in Section 6. For dimensional requirements, see 6.6.

5.1.7.1 Upholstery ticking, as well as any flange, tape, and pocketing materials used, shall exhibit a char length not exceeding 5.0 in. (127 mm), an after flame period not exceeding 2.0 s, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method D 6413. The char length and after flame requirements shall not apply to tape.

5.1.7.2 Upholstery ticking, as well as any flange, tape, and pocketing materials used, shall exhibit a char length not exceeding

**NOTE 1**—Only Molten and/or Flaming Droplets requirement applies to Tape.

**NOTE 2**—Only Initial Flammability requirements apply to Pocketing Material.

**NOTE 3**—Tear Strength and Breaking Strength apply only to Upholstery Ticking.

**NOTE 4**—When materials are not identical on both sides, each side shall be tested as a different specimen.
5.0 in. (127 mm), 127 mm (5.0 in.), an after flame period not exceeding 2.0 s, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method D 6413, after having been subjected to 15 launderings. The char length and after flame requirements shall not apply to tape.

5.1.7.3 Border ticking materials shall exhibit a char length not exceeding 1.5 in. (38 mm), 38 mm (1.5 in.), an after flame period not exceeding 2.0 s, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method D 6413. Border ticking materials shall also exhibit a maximum specific optical density ($D_{\text{MAX}}$) not exceeding 50, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method E 662.

5.1.7.4 Cushioning and insulator layer materials shall exhibit a char length not exceeding 5.0 in. (127 mm), 127 mm (5.0 in.), an after flame period not exceeding 2.0 s, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method D 6413. Cushioning and insulator layer materials shall also exhibit a radiant panel index (J) not exceeding 10 when tested in accordance with Test Method E 162. Cushioning and insulator layer materials shall also exhibit a maximum specific optical density ($D_{\text{MAX}}$) not exceeding 200, and shall not exhibit any molten or flaming droplets, or both, when tested in accordance with Test Method E 662. When materials are not identical on both sides, each side shall be tested as a different specimen, with Test Method E 162 and with Test Method E 662. An optional additional fire test, applicable if the mattress is intended for use aboard U.S. Navy vessels, is shown in Annex A2.

5.1.7.5 Physical Properties:

1. Upholstery ticking materials shall exhibit a tear strength of no less than 1.6 kg (3.5 lb) in either the warp or the filling direction when tested in accordance with Test Method D 1424. Upholstery ticking materials shall also exhibit a breaking strength of no less than 42.6 kg (94 lb) in the warp direction and of no less than 26.3 kg (58 lb) in the filling direction when tested in accordance with Test Method D 5034.

2. Border ticking materials shall exhibit a tear strength of no less than 1.8 kg (4 lb) in either the warp or the filling direction when tested in accordance with Test Method D 1424. Border ticking materials shall exhibit a breaking strength of no less than 42.6 kg (94 lb) in the warp direction and of no less than 22.7 kg (50 lb) in the filling direction when tested in accordance with Test Method D 5034.

3. Cushioning and insulator layer materials shall exhibit a dry heat aging/compression force deflection of no more than 20 % change in compression force deflection when tested in accordance with Sections C and K of Test Method D 3574.

5.1.8 Label—The label shall state that the mattress meets one of the following sets of fire test requirements: (1) this specification (per Table 1 and Table 2), (2) California Technical Bulletin 129, or (3), Purchase Description—Mattress—Innerspring, Flame-Resistant, Shipboard—NAVSEA 05L PD 4-02 (May 2002).

5.2 Solid Core Mattress—The required components of a solid core mattress are cushioning and upholstery ticking.

5.2.1 All materials used shall meet the mechanical property and fire performance requirements of Table 1, as indicated in 5.1, for innerspring mattresses, as applicable. All materials used shall comply with appropriate commercial bedding industry standards of manufacture and durability.

5.2.2 Mattress—All mattress components shall meet the requirements of Table 1, as appropriate. The overall mattress shall meet the performance requirements of Table 2.

5.2.3 Label—The label shall state that the mattress meets one of the following sets of fire test requirements: (1) this specification (per Table 1 and Table 2), (2) California Technical Bulletin 129, or (3), Purchase Description—Mattress—Innerspring.
5.3 Box Spring—The tolerances of the overall length, width and thickness dimensions of the box spring shall be consistent with the mattress dimensions. Fig. 1 shows an example of a typical design of box spring. The top wire assembly shall be attached securely to the border wire.

5.3.1 The individual coils shall be securely attached to the top wire assembly. The coils, or the complete spring assembly, shall be given thermal treatment to relieve residual stresses caused by coiling. The wood frame assembly shall be suitable for commercial use or for use aboard U.S. Navy vessels. All four corners shall be suitably fastened at each point of attachment, in accordance with standard commercial bedding practices. All bottom edges shall be eased (sharp corners blunted by sanding). The wood base frame shall be constructed of industry standard box spring frame lumber, typically Eastern Canadian spruce or Southern yellow pine. The spring assembly shall be attached to the wood base frame.

5.3.2 Cushioning, Insulation Layers, Ticking and Construction —The requirements for materials and manufacture of all other components shall be as those for innerspring mattresses, in 5.1, as applicable. The insulation layer shall be attached to the top surface to prevent slippage. Each corner shall be filled with cushioning material, to provide proper tailoring. The box spring border ticking shall be of the same material as that of the mattress. The top panel shall be of a material that retards slipping. The cover assembly shall be placed over the top of the steel and wood assembly and properly attached, in accordance with standard commercial bedding practices.

5.3.3 The box spring shall display trade labels regarding material content and manufacturer as required by law.

5.3.4 Label—The label shall state that the box spring meets one of the following sets of fire test requirements: (1) this specification (per Table 1 and Table 2), (2) California Technical Bulletin 129, or (3), Purchase Description—Mattress—Innerspring, Flame-Resistant, Shipboard—NAVSEA 05L PD 4-02 (May 2002).

5.4 Mattress/Box Spring:

5.4.1 Packaging shall protect the products from physical damage and be acceptable to a common carrier.

5.4.2 Each item shall be clearly marked in accordance with the purchase order requirements.

6. Performance Requirements for the Complete Mattress

6.1 The complete mattress shall meet the performance requirements shown in Table 2.

6.2 Fire Performance Requirements — At a minimum, the mattress shall comply with the requirements of 6.2.1-6.2.4 (consistent with those contained in NFPA 301).

6.2.1 The mattress ticking shall pass the requirements for Class A performance in accordance with 16 CFR 1632.

6.2.2 The mattress shall exhibit a maximum rate of heat release not exceeding 100 kW when tested in accordance with Test Method E 1590.

6.2.3 The mattress shall exhibit a total heat released in the first 10 min of test not exceeding 25 MJ when tested in accordance with Test Method E 1590.
6.2.4 The mattress shall exhibit a mass loss in the first 10 min of test not exceeding 1.4 kg (3 lb) when tested in accordance with Test Method E 1590.

6.3 **Optional Fire Performance Requirements**—As an option, the mattress shall be permitted to exhibit fire performance in accordance with the fire test method described in Annex A1. This will involve, at a minimum, that the mattress comply with the requirements of 6.3.1-6.3.3. If a mattress is intended for use aboard U.S. Navy vessels, it shall be required to comply with the criteria shown in 6.3.1-6.3.3, when tested in accordance with the fire test method described in Annex A1.

6.3.1 The mattress shall exhibit a maximum rate of heat release, during the test, not exceeding 150 kW.

6.3.2 The mattress shall exhibit a maximum average specific extinction area, during the test, not exceeding 300 m²/kg.

6.3.3 The mattress shall not exhibit flaming droplets during the test.

6.4 **Physical Characteristics:**

6.4.1 The mattress shall exhibit a firmness rating of 330 N (75 lbf) ± 10 %, and shall not exhibit any signs of wear, tear, damage, or degradation, when tested for 100 000 cycles in accordance with Section 7 of Test Method F 1566. The test report shall include the initial firmness rating, the firmness rating after 25 000, 50 000, and 75 000 cycles, as well as the final firmness rating after 100 000 cycles. The test report shall also include any signs of wear, tear, damage, or degradation on any part of the mattress when inspected after each set of 25 000 cycles.

6.4.2 The mattress shall exhibit a permanent deformation not exceeding 20 % of depth, when tested in accordance with the Rollator Test section of Test Method F 1566.

6.4.3 The mattress shall exhibit an accumulated dimple not to exceed 1.75 in. (44.5 mm), 44.5 mm (1.75 in.), when tested in accordance with the Cornell Test section of Test Method F 1566.

6.4.4 The mattress shall exhibit a support firmness change not exceeding (+40 %) or (-15 %), when tested in accordance with the Cornell Test section of Test Method F 1566.

6.5 **Visual Inspection**—Visual inspection shall be conducted to check for any defects in the finished mattress, as shown in Table 3. The finished mattresses shall be clean and free from defects and other conditions affecting form, fit, function, and appearance. The lot size shall be expressed in units of mattresses. The sample unit shall be one mattress. The inspection shall be performed in accordance with ANSI/ASQC Z1.4.

6.6 Dimensional requirements for mattresses are contained in ANSI A.357.1-1981. Dimensional requirements for innerspring mattresses intended for use aboard U.S. Navy vessels are contained in Purchase Description—Mattress—Innerspring, Flame-Resistant, Shipboard—NAVSEA 05L PD 4-02 (May 2002).

**NOTE 1**—Dimensional requirements in NAVSEA 05L PD 4-02 are contained in inch-pound units.

7. **Workmanship, Finish and Appearance**

7.1 All workmanship and material shall be of specified quality in keeping with the best commercial marine practice so as to prevent any damage to the item.

produce each item suitable for its intended use.

7.2 Where first article inspection is required, it shall be spelled out in the purchase order.

8. Inspection and Certification

8.1 The manufacturer or distributor shall issue a certificate of conformance for each shipment of mattresses and of box springs to this specification. In addition, the manufacturer or distributor shall have available (upon request) independent test data to depict compliance with the stated fire test criteria, either for Test Method E 1590 or for the test method described in Annex A1 of this specification. The independent test data shall always reflect a test date not to exceed a time period of three years from the date of product shipment.

ANNEXES

(Mandatory Information)

A1. FIRE TEST METHOD FOR MATTRESSES FOR USE IN HIGH RISK MARINE VESSEL OCCUPANCIES

A1.1 This fire test method is a modification of the one in Test Method E 1590, as developed by the U.S. Navy for determining the acceptability of mattresses for use aboard marine vessels. It assesses the burning behavior of mattresses by determining heat release, smoke release, mass loss, and combustion product release when a mattress is subjected to a specified flaming ignition source under well-ventilated conditions.

A1.2 Apparatus and Procedure:

A1.2.1 The apparatus shall be as described in Section 6 of Test Method E 1590, except as indicated in A1.3.

A1.2.2 The test specimen shall be as described in Section 7 of Test Method E 1590, except as indicated in A1.3.

A1.2.3 The calibration of instrumentation shall be as described in Section 8 of Test Method E 1590.

A1.2.4 The test specimen conditioning shall be as described in Section 9 of Test Method E 1590.

A1.2.5 The test procedure shall be as described in Section 10 of Test Method E 1590, except as indicated in A1.3.

A1.2.6 The calculations shall be as described in Section 11 of Test Method E 1590, except as indicated in A1.3.

A1.2.7 The test report shall be as described in Section 12 of Test Method E 1590, except for the additional information required in A1.45.

A1.3 Test Method Modifications for This Standard:

A1.3.1 The test specimen shall be a full sized mattress, mounted on an open flame bunk or support system that will allow direct flame impingement to the bottom surface and sides of the mattress by the ignition source.

A1.3.2 Replace the “T” burner described in 6.2 of Test Method E 1590 with a burner having a nominal 0.3 by 0.3 m (1 by 1 ft) top surface. The burner shall have a minimum 102 mm (4 in.) layer of Ottawa silica sand, to provide the horizontal surface through which the gas is supplied. The sand layer shall be flush with the top of the burner. The burner shall be positioned such that the top edge of the burner is 380 ± 13 mm (15 ± 0.5 in.) below the bottom edge of the test specimen and centered with respect to the long side of the test specimen, with one-half of the width of the burner under the mattress.

A1.3.3 Support the mattress on a metal bed frame, constructed of heavy angle section iron, with all joints welded. The bed frame shall be nominally 1.94 by 0.76 m (76 by 30 in.) and shall contain a wire grid, constructed of nominally 2 mm (0.08 in., 12.5 gage) welded steel wire mesh, with nominally 51 by 102 mm (2 by 4 in.) openings, secured to the perimeter of the bed frame with steel tie wires.

A1.3.4 The test specimen shall be exposed to a fire producing a total heat output of 50 ± 3 kW (47.6 ± 2.86 Btu/s) for the first 5 min of the test followed by an increase to 100 ± 5 kW (95.2 ± 4.76 Btu/s) for an additional 10 min. The total fire exposure shall be 15 min.

A1.3.45 Report the average specific extinction area from the test (m²/kg), which is assessed as the total smoke released (m²) divided by the total mass loss (kg).

A1.4 Critical Test Results—The following three test results shall be presented in a summary table: (a) the maximum rate of heat release obtained during the test minus the burner heat input at the time the maximum heat release rate occurs, (b) the average specific extinction area from the test, and (c) a visual report as to whether or not burning droplets were formed and dropped to the floor or the top of the mattress platform. These critical test results are used for the pass-fail criteria described in 6.3, if the mattress is required to pass this test.
A2. OPTIONAL COMPONENT FIRE TEST METHOD FOR CUSHIONING MATERIALS FOR MATTRESSES FOR USE IN HIGH RISK MARINE VESSEL OCCUPANCIES

A2.1 If required, use Test Method E 1354 for assessing the heat release rate of cushioning materials to be included in mattresses for use aboard U.S. Navy vessels, under the conditions of A2.2 and with the pass/fail criteria of A2.3.

A2.2 The cushioning material shall be tested at an incident heat flux of 50 kW/m², in the horizontal orientation and at a thickness of 50 mm (approximately 2 in.). Testing shall be conducted in triplicate.

A2.3 Pass/Fail Criteria:

A2.3.1 The maximum rate of heat release of the cushioning material (average of the three replicate tests) shall not exceed 120 kW/m².

A2.3.2 The average rate of heat release of the cushioning material during the three minutes following ignition (average of the three replicate tests) shall not exceed 50 kW/m².

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
1. Scope

1.1 This specification provides the material requirements, construction, installation, and testing requirements for open-weather deck, storm-and-guard, fiberglass square railing systems. Components are to be manufactured by the pultrusion process.

1.2 The values stated in inch-pound units are to be regarded as the standard. The SI units given in parentheses are for information purposes only.

1.3 The following safety hazards caveat pertains only to the test methods portion, Section 9, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

D 3846 Test Method for In-Plane Shear Strength of Reinforced Plastics
D 3917 Specification for Dimensional Tolerance of Thermosetting Glass-Reinforced Plastic Pultruded Shapes
E 84 Test Method for Surface Burning Characteristics of Building Materials

3. Terminology Definition

3.1 pultrusion—process of pulling fiberglass rovings (strands), mats, and other forms of reinforcements such as woven fiberglass through baths of thermosetting liquid resin, and then through a heated forming die (made of steel) to form a completed composite fiberglass structural shape.

3.2 Discussion—The heated die causes a chemical reaction to be initiated in the resin. The liquid resin molecules will cross-link and develop into a hardened plastic that is reinforced with the fiberglass.

4. Classification

4.1 Handrails and stanchions shall be fiberglass pultruded square tube available in the following two types:

4.1.1 Type 1F—Three-course railing systems, for use along the exposed peripheries of freeboards, weather decks, and superstructure decks.

4.1.2 Type 2F—Two-course railing systems, for use on bridges, platforms, walkways, and elsewhere as needed.

5. Ordering Information

5.1 Orders for materials under this specification shall include the following information:

5.1.1 Quantity (lineal feet (metres) of railing system).

5.1.2 Name of material (fiberglass pultruded square railing system).

5.1.3 Type (see 4.1).

5.1.4 Fiberglass coaming, if specified (lineal feet (metres)).

5.1.5 Attachment method for stanchions (see 6.2.6).

5.1.6 ASTM designation and year of issue.

6. Materials and Manufacture

6.1 Materials:

6.1.1 The fiberglass (GRP) pultruded square tube shall be $2 \times 2 \times \frac{1}{4}$ in. ($50 \times 50 \times 6.4$ mm) with the outside corner radius $\frac{3}{32}$ in. (4 mm). A synthetic surface veil shall be the outermost layer of reinforcement covering the entire exterior surface. The resin used throughout the part shall be either a flame retardant isophthalic polyester or a flame retardant vinyl ester resin containing an ultra-violet radiation (UV) inhibitor. The fiberglass pultruded square tube shall achieve a flame...
spread index of 25 or less rating in accordance with Test Method E 84. In addition, the fiberglass pultruded square tube shall achieve a smoke developed index of 450 or less. The exterior of the pultruded square tubing shall have a 1 mil (0.025 mm) minimum polyurethane protective coating for added ultraviolet protection. The fiberglass pultruded square tubing shall meet the properties specified in Table 1 and dimensional tolerances shall be in accordance with Specification D 3917.

6.1.2 Fiberglass sheet or solid fiberglass bar shall be used to fabricate the internal connectors for the square tube. The internal connectors will be 1 1/2 × 1 1/2 in. (38.1 × 38.1 mm) with length and angularity variable to meet the requirements of each connection. Angular connections shall be fabricated from fiberglass sheet bonded together using a bisphenol A/epichlorohydrin epoxy resin with an amine curing agent to give a minimum thickness of 1 1/2 in. (38.1 mm). The angular connections will be fabricated to the proper dimension from the fiberglass sheets that have been bonded together. Fiberglass sheet used for angular connections shall meet the properties specified in Table 1. Fiberglass sheet used for the straight connections shall meet the properties specified in Table 1. Fiberglass solid bar, 1 1/2 × 1 1/2 in. (38.1 × 38.1 mm), shall be used for the straight connections and shall meet the properties specified in Table 1.

6.1.3 Rivets shall be nickel copper or nonmetallic.

6.1.4 Bolts shall be 1/2 in. (12.7 mm) diameter, 316 stainless steel.

6.1.5 Adhesive used to bond internal connectors to fiberglass pultruded square tube shall be a bisphenol A/epichlorohydrin epoxy resin with an amine curing agent.

6.2 Manufacture:

6.2.1 There shall be a minimum clearance of 4 in. (101 mm) between rail or stanchion centerline and other structure except where a direct tie-in is desired.

6.2.2 Stanchions and standoffs are to be spaced on 5 ft (1.52 m) maximum centers.

6.2.3 All top rails are to be located 42 in. (1.067 m) above the deck (deck to top of square tube).

6.2.4 Railing system height for ladders shall be measured vertically from the nosing line.

6.2.5 Coaming constructed of fiberglass pultruded material shall meet the properties specified in Table 1. fiberglass coaming shall be 4 in. (101 mm) in vertical height from its top edge to the level of the deck. Fiberglass coaming shall be a corrugated or channel design with a minimum of 1/2 in. (12 mm) deep section or minimum 1/2 in. channel leg to develop added strength. It shall be securely fastened to the stanchion using nickel-copper rivets and with not more than 1/4 in. (6.4 mm) clearance above floor level. The thickness shall be at least 3/16 in. (4.75 mm) with the overall depth not more than 1 in. (25.4 mm). See Fig. 1 for example.

6.2.6 Fiberglass square tube rail stanchions shall be attached to the deck or structural supports as follows:

6.2.6.1 Attached to steel coaming (Fig. 2).

6.2.6.2 Inserted in pedestal/stanchion mount (Fig. 3).

6.2.6.3 Attached to structural members (Fig. 4).

6.2.6.4 Attached to steel angle (Fig. 5).

7. Dimensions

7.1 Dimensions for Type 1F—Three-course rails shall be in accordance with Fig. 6.

8. Workmanship, Finish, and Appearance

8.1 All cut edges and holes shall be sealed with a compatible resin system containing a UV inhibitor.

8.2 All connections shall be made using a one piece solid internal connector (in accordance with 6.1.2) bonded to the interior of the square tube using an epoxy adhesive and riveted. The following types of connections are defined:

8.2.1 Corner connection (Fig. 7).
8.2.2 Splice (Fig. 8).
8.2.3 Midrail to stanchion (Fig. 9).
8.2.4 Top rail to stanchion (Fig. 10).
8.2.5 Stair railing system to stanchion (Fig. 11).
8.2.6 Stair rail to rail (Fig. 12).

8.3 All bolted connections shall have a one-piece solid internal connector (in accordance with 6.1.2) bonded to the interior of the square tube through which connector holes will be drilled. A minimum 1 in. (26 mm) length of the solid internal connector will be on each side of the drilled hole.

8.4 Additional solid internal connector pieces can be bonded with epoxy adhesive to the interior of the square tube as desired.

9. Test Methods

9.1 Test at least one end stanchion and one other stanchion of each platform or deck by application of a load horizontally in accordance with the methods in “Strength and Stiffness of Metal Railing Systems and Rails for Buildings.”

10. Keywords

Standard Specification for Mortar, Refractory (High-Temperature, Air-Setting)\textsuperscript{1}

This standard is issued under the fixed designation F 1097; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (\(\epsilon\)) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers dry air-setting refractory mortar for use in laying and bonding refractory brick in ship boiler furnaces and wet air-setting refractory mortar for use in laying refractory brick in stationary boiler furnaces, bright annealing furnaces, controlled atmosphere furnaces, and furnaces heated by electric elements.

1.2 The values stated in inch-pound units are to be regarded as standard. The SI units in parentheses are for information purposes only and may be approximate.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
C 24 Test Method for Pyrometric Cone Equivalent (PCE) of Fireclay and High Alumina Refractory Materials\textsuperscript{2}
C 27 Classification of Fire Clay and High-Alumina Refractory Brick\textsuperscript{2}
C 92 Test Methods for Sieve Analysis and Water Content of Refractory Materials\textsuperscript{2}
C 133 Test Methods for Cold Crushing Strength and Modulus of Rupture of Refractories\textsuperscript{2}
C 198 Test Method for Cold Bonding Strength of Refractory Mortar\textsuperscript{2}
C 199 Test Method for Pier Test for Refractory Mortars\textsuperscript{2}
2.2 Federal Specifications\textsuperscript{3}—The following documents shall apply only when one or more of the requirements of S1 are specified in the contract or purchase order (see 4.1.3):

PPP-B-704 Pails: Shipping, Steel (1 through 12 gallon)
PPP-B-35 Bags: Textile, Shipping, Burlap, Cotton and Waterproof Laminated
PPP-B-702 Sacks, Shipping, Paper

2.3 Military Standards\textsuperscript{3}—The following documents shall apply only when one or more of the requirements of S1 are specified in the contract or purchase order (see 4.1.3):

MIL-STD-105 Sampling Procedures and Tables for Inspection by Attributes
MIL-STD-129 Marking for Shipment and Storage

3. Classification

3.1 The refractory mortar shall be of the following types:
3.1.1 Type 1—Dry.
3.1.2 Type 2—Wet.

4. Ordering Information

4.1 Orders for material under this specification shall include the following information, as necessary to adequately describe the material:
4.1.1 ASTM designation and year of issue,
4.1.2 Type required (see 3.1), and
4.1.3 Optional requirements, if any (see S1).

5. Material

5.1 The mortar shall be composed of finely ground heat-resistant clays, minerals, or a mixture of clays and minerals in either a dry or wet condition.

5.1.1 Type 1, Dry—Mortar shall be furnished dry and shall be ready for use as soon as mixed with water. Mortar, after being mixed with water and then dried, shall be capable of being remixed with water.

5.1.2 Type 2, Wet—Mortar shall be furnished ready for use at a trowelling consistency and shall be easily mixed with water to a dipping consistency.

6. Performance Requirements

6.1 Resistance to Heat Soaking—Mortar shall not soften nor show any evidence of fusion, and the shrinkage shall not be greater than hairline cracks when tested as specified in 11.2.

6.2 Bonding Strength—The average modulus of rupture at the brick joint when tested as specified in 11.3 shall be not less than shown in Table 1.

6.3 Pyrometric Cone Equivalent (PCE)—The PCE shall be not less than cone 32 (see 11.4).

\textsuperscript{1} This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.07 on General Requirements.

\textsuperscript{3} Standardization Documents Order Desk, Building 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, ATTN: NPODS.
7. Requirements

7.1 Fineness—Mortar shall be ground to such fineness that not more than 5% shall be retained on a No. 40 ASTM sieve, and not more than 0.5% shall be held on a No. 30 ASTM sieve (see 11.1).

7.2 Shelf Life, Type 1—Mortar shall show no deterioration after 1 year’s storage.

7.3 Shelf Life, Type 2—At any time within one year of shipment from the supplier, the mortar in a previously unopened container shall not have stiffened to such an extent as to interfere with its easy removal and mixing.

7.4 Consistency—Mortar, when tempered with water, shall be of such consistency that it will be suitable for spreading easily with a trowel or for dipping and for laying refractory brick and bonding them together upon drying and upon subsequent heating at furnace temperatures. Mortar shall retain this degree of workability for 2 h.

7.4.1 The mixed mortar shall have sufficient water retention to permit a 1/16-in. (2-mm) joint to be made with a trowelling consistency, but not allow the newly laid brick to float out of position.

8. Workmanship

8.1 Workmanship shall be first class in every respect. There shall be no foreign material or caked aggregate lumps in the mortar. Wet mortar shall be easily removed from the container and shall mix easily to a uniform trowelling consistency.

9. Sampling

9.1 An inspection lot for tests and inspections shall consist of all material manufactured at essentially the same time and of the same type offered for delivery at one time.

10. Specimen Preparation

10.1 The entire mortar sample for testing shall be thoroughly mixed to ensure uniformity before any portion is taken for tests. The selected portion of Type 1 (dry) mortar shall be mixed with water to a trowelling consistency for the tests of 11.2 and 11.3.

10.2 For the test specified in 11.3, brick-mortar joints shall be prepared in accordance with Test Method C 198, except that refractory bricks, conforming to Classification C 27, super-duty, shall be used and shall be cut in half. The two halves of each brick shall be placed in a device suitable for bringing, with a straight motion, the molded ends together with the faces parallel at all times to form a bond.

10.2.1 A small quantity of mortar shall be spread by a trowel on the upper face forming the bond to ensure intimate contact. Sufficient mortar to give a 1/8-in. (3-mm) thick layer shall be spread evenly on the lower bond forming face and the upper half shall be lowered until it is 1/16 in. (2 mm) from the lower half. The excess mortar shall be cut from the joint, flush with the sides of the brick. The unit thus formed shall be removed at once from the bond-forming machine. The bond specimens shall be allowed to air-dry for 24 h.

9.2 For the tests specified in 11.1 through 11.4, the sample unit shall be 15 lbs (7 kg) of mortar. No fewer than three sample units shall be randomly selected throughout the lot. No more than one sample shall be drawn from any one container.

9.2.1 The test sample shall be a 45-lbs (20-kg) composite of the randomly selected sample units. Two or more determinations as applicable (see Table 2) shall be performed on the composite. There shall be no evidence of failure to meet the specified unit or average requirements.

9.3 The PCE shall be determined on two cones of different samples from each lot. If both cones fail, this shall be cause for rejection without retest. If either cone fails, three additional cones shall be made, each from a different sample. If any one of the three retest cones fail, this shall be cause for rejection.

**10. Specimen Preparation**

10.1 The entire mortar sample for testing shall be thoroughly mixed to ensure uniformity before any portion is taken for tests. The selected portion of Type 1 (dry) mortar shall be mixed with water to a trowelling consistency for the tests of 11.2 and 11.3.

10.2 For the test specified in 11.3, brick-mortar joints shall be prepared in accordance with Test Method C 198, except that refractory bricks, conforming to Classification C 27, super-duty, shall be used and shall be cut in half. The two halves of each brick shall be placed in a device suitable for bringing, with a straight motion, the molded ends together with the faces parallel at all times to form a bond.

10.2.1 A small quantity of mortar shall be spread by a trowel on the upper face forming the bond to ensure intimate contact. Sufficient mortar to give a 1/8-in. (3-mm) thick layer shall be spread evenly on the lower bond forming face and the upper half shall be lowered until it is 1/16 in. (2 mm) from the lower half. The excess mortar shall be cut from the joint, flush with the sides of the brick. The unit thus formed shall be removed at once from the bond-forming machine. The bond specimens shall be allowed to air-dry for 24 h.

<sup>a</sup>If failure is indicated, report description of failure or numerical point of failure as applicable.

<sup>b</sup>Test report shall include all values on which results are based.

<sup>c</sup>See 9.3.
11. Test Methods

11.1 Fineness—The fineness test shall be made in accordance with Test Methods C 92.

11.2 Heat Soak:

11.2.1 A pier of refractory brick, conforming to Classification C 27, super-duty, laid up with the test mortar shall be prepared and heated at 2910°F (1588°C) for 5 h in accordance with Test Method C 199.

11.2.2 The cooled pier shall be examined for evidence of shrinkage, softening, or fusion of the mortar. One or more mortar joints shall be broken and the freshly broken mortar surface shall be viewed from various angles. Any shininess or light flash at the mortar surface shall be considered an indication of excessive fusion.

11.3 Bonding Strength:

11.3.1 Five bond specimens (see 10.2) shall be placed in an oven operating at 230°F (110°C) for 24 h; five bond specimens shall be held at each of the other test temperatures (1000°F, 2000°F (538°C, 1093°C) for 5 h and then allowed to cool in the closed furnace for 12 to 18 h. The time required to reach test temperatures shall be 3 h. The bond shall not be broken until the specimens have reached approximately room temperature.

11.3.2 The modulus of rupture of the test specimens shall be determined in accordance with Test Methods C 133, except that the load shall be applied at the rate of 1000 lb/min (450 kg/min).

11.3.2.1 In conducting this test, bring the upper bearing edge to bear on the joint itself.

11.4 Pyrometric Cone Equivalent—The PCE shall be determined in accordance with Test Method C 24.

12. Inspection

12.1 Unless otherwise specified in the contract or purchase order, the supplier is responsible for the performance of all inspection requirements as specified herein. Except as otherwise specified, the supplier may use his own facilities or any commercial laboratory acceptable to the purchaser. The purchaser reserves the right to perform any of the inspections set forth in the specification where such inspections are deemed necessary to ensure supplies and services conform to prescribed requirements.

13. Packaging

13.1 Packing of the mortar shall be sufficient to afford adequate protection against deterioration and physical damage during shipment from the supply source to the first receiving activity for immediate use and may conform to the supplier’s commercial practice.

14. Keywords

14.1 bonding strength; mortar; refractory mortar

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified in the contract or purchase order (see 4.1.3.).

S1. Special Government Requirements

S1.1 Quality Conformance Inspection:

S1.1.1 Sampling for quality conformance inspection shall be performed in accordance with the provisions set forth in MIL-STD-105, except where otherwise indicated.

S1.1.2 Examination of the end item shall be made in accordance with the classification of defects, inspection levels, and quality levels specified in S1.1.2.1 through S1.1.2.3. The lot size, for the purpose of determining the sample size in accordance with MIL-STD-105, shall be expressed in units of filled containers for the examinations in S1.1.2.1 and S1.1.2.2.

S1.1.2.1 Examination of the end item container for defects in appearance, workmanship, closures, and marking (see Table S1.1). The sample unit for this examination shall be one filled container.

S1.1.2.2 Examination of end item container for defects in net contents. The sample unit for this examination shall be one filled primary container. The average net contents shall be not less than the specified or indicated quantity.

S1.1.2.3 Inspection levels for examinations. The inspection levels for determining the sample size and acceptance shall be as specified in Table S1.2.

S1.1.2.4 Examination for workmanship. For the examination for conformance to Section 8, the sample unit shall be one bag of dry mortar or one drum of wet mortar, as applicable. The
examination may be made during selection of samples for testing or other examinations. For each lot, select a sample size of five. Reject the lot on one failure.

S1.2 Tests:
S1.2.1 For the tests specified in 11.1 through 11.4, the inspection level for determining sample size shall be S1 in accordance with MIL-STD-105.

S1.3 Preparation for Delivery:
S1.3.1 Type 1, Dry Mortar:
S1.3.1.1 Levels A and B—Type 1 mortar shall be packed in 100-lbs (45-kg) unit quantity in multiwall shipping sacks conforming to UU-S-48 or PPP-B-35.

S1.3.2 Type 2, Wet Mortar:
S1.3.2.1 Levels A and B—Type 2 mortar shall be packed in steel drums conforming to Type II of PPP-B-704, except that use of 22-gage steel drums of 12-gal (44-L) capacity is acceptable. Dropside handles shall be provided.

S1.3.3 Marking—In addition to any special marking required by the contract or purchase order, shipping containers shall be marked for shipment in accordance with MIL-STD-129.
Standard Specification for
Envelope Dimensions for Butterfly Valves—NPS 2 to 24

1. Scope

1.1 This specification provides standard dimensions for manual (lever and gear actuator) butterfly valves installed in shipboard piping systems in NPS 2 to NPS 24, inclusive.

1.2 This specification covers conventional and ANSI B16.34 class butterfly valves of both lug and wafer types.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ANSI Standard:
B 16.34 Small Butt Welding End Valves

3. Dimensions

3.1 Face-to-Face Dimensions:
3.1.1 Valve body face-to-face dimensions are provided in Table 1.

3.1.2 Face-to-face dimensions are the metal-to-metal dimensions between the valve body flange faces that require separate gaskets or the compressed or installed condition for valves using liners that extend from the body contact faces and act as flange gaskets.

3.2 Actuator Dimensions:

3.2.1 The maximum permissible dimensions for lever- and gear-type actuators are provided in Fig. 1.
3.2.2 The handwheel and handle may be on either side of the valve.
3.2.3 All handwheels and handles rotate clockwise to close the valve.

4. Tolerances

4.1 Face-to-Face Dimensions—A plus or minus tolerance of 1/16 in. (1.6 mm) for all sizes shall be allowed (see Table 1).

5. Keywords

5.1 envelope dimensions; gear actuator butterfly valves; lever butterfly valves; manual butterfly valves

FIG. 1 Actuator Envelope Dimensions

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for Rat Guards, Ship’s (Metric)\(^1\)

This standard is issued under the fixed designation F 1099M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (\(\epsilon\)) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the materials, dimensions, and assembly of steel and aluminum rat guards.

1.2 Rat guards are intended to prevent rats from boarding ships by way of mooring lines.

1.3 The values stated in SI units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

- A 525M Specification for General Requirements for Steel Sheet, Zinc-Coated (Galvanized) By the Hot-Dip Process (Metric)\(^2\)
- B 209M Specification for Aluminum and Aluminum-Alloy Sheet and Plate (Metric)\(^3\)

3. Classification

3.1 Rat guards shall be classified into three types as follows:

3.1.1 Type I—Multiple-line (doubling up), self-adjustable, accommodating the mooring line combinations listed in Table 1.

3.1.2 Type II—Single-line, self-adjustable, accommodating a single 5-mm wire to a 76-mm-diameter mooring line.

3.1.3 Type III—Conical shape with tapered, slotted sleeve.

Type III rat guards shall be of the following sizes: (a) 75 mm, (b) 125 mm and (c) 200 mm.

3.2 Types I and II rat guards (see 3.1.1 and 3.1.2) are designed to be installed from the deck or pier without a person physically coming in contact with the mooring lines or hawser, by lowering and positioning the guards away from the ship’s hull with two ropes that are permanently attached as guide and tie ropes (see Fig. 1).

3.3 Type III rat guards (see 3.1.3) require a person to contact the mooring line to pull the two halves of the conical guard around the mooring line, wrap the slotted sleeves (see Fig. 2) to the line, and physically close any opening between the mooring line and the circular opening at the center of the guard.

4. Ordering Information

4.1 Orders for rat guards under this specification shall include the following information:

4.1.1 ASTM designation.

4.1.2 Type required (see 3.1):

4.1.2.1 If Type III, material required (see 5.1.3).

4.1.2.2 If Type III, size required (see 3.1.3).

4.1.3 Quantity required.

4.1.4 Optional requirements, if any (see Supplementary Requirements S1 through S3).

5. Materials and Manufacture

5.1 Materials:

5.1.1 Type I rat guards shall be made of aluminum-alloy sheet metal conforming to the requirements of ASTM Specification B 209M, 6061-T6, or 5052-H32.

5.1.2 Type II rat guards shall be made of galvanized sheet steel conforming to the requirements of ASTM Specification A 525M, Coating Designation 450. The coating shall be a minimum of 450 g/m\(^2\) in accordance with the triple-spot test of ASTM Specification A 525M.

5.1.3 Type III rat guards shall be made of either of the materials specified in 5.1.1 and 5.1.2 (see 4.1.2.1).

5.2 Manufacture:

5.2.1 Types I and II rat guards shall be provided with the following:

5.2.1.1 Hinge Bolt—A M 7 × 1 hexagon head bolt 20 mm long with elastic stop nut and washer. All parts shall be corrosion-resistant steel.

5.2.1.2 Guide and Tie Rope—Polyester or nylon of good commercial quality, 6- or 9-mm diameter by 6 m long.

\(^1\) This specification is under the jurisdiction of ASTM Committee F-25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.07 on General Requirements.

\(^2\) Annual Book of ASTM Standards, Vol 01.06.

\(^3\) Annual Book of ASTM Standards, Vol 02.02.
5.2.1.3 **Grommet**—Good commercial quality brass and of size suitable for the guide and tie ropes.

5.2.2 **Type III Rat Guards**—Type III rat guards shall consist of two half disks and two half tapered sleeves. Both halves shall be identical except one half shall be provided with a “U” shaped sleeve.

5.2.2.1 The hinge bolt provided with each rat guard shall consist of a commercial M 7 × 1 hexagon head bolt, 20-mm-long nut, and washer. All parts shall be corrosion-resistant steel.

5.2.2.2 The galvanized steel or aluminum sleeve shall be slotted as specified in Table 2 and Fig. 2, so that when the rat guard is in place, it may be drawn tightly against the hawser, with lashing. The formed sleeves shall be tapered to permit nesting of the rat guards, for compact shipping.

5.2.2.3 When the rat guard is made of galvanized steel, the sleeve shall be riveted and soldered to the disk with tinner’s type rivets, No. 3, 4-mm diameter for each half sleeve. The number of rivets shall be the same as the number of prongs. Soldering of the half sleeve flange to the half disk shall be continuous, inside and outside (see Fig. 2).

</tr>
</tbody>
</table>
5.2.2.4 When the rat guard is made of aluminum alloy sheets, the sleeve shall be spot welded and riveted to the disk. Spacing of spot welds shall not exceed 50 mm with a minimum of four spot welds provided on each half of the rat guard. The rivets shall be equivalent to No. 3, 4-mm diameter. Five rivets shall be installed in each half of the guard. Rivets shall be located equidistant, between adjacent spot welds (see Fig. 2).

6. Dimensions and Permissible Variations

6.1 Dimensions of Type I rat guards ±6 mm shall be as follows:

6.1.1 Overall height shall be 1000 mm.
6.1.2 Overall thickness shall be 40 mm maximum.

6.2 Dimensions of Type II rat guards ±6 mm shall be as follows:

6.2.1 Overall length shall be 1000 mm.
6.2.2 Overall thickness shall be 40 mm maximum.
6.3 Dimensions of Type III rat guards shall be as specified in Table 2 and Fig. 2.

7. Workmanship, Finish, and Appearance

7.1 Workmanship shall be of the highest quality throughout and in conformance with the accepted commercial standard practice for this type of equipment.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the contract or order (see 4.1.4).

S1. Referenced Documents

S1.1 The following documents are applicable only when the requirements of S3 are specified in the contract or purchase order (see 4.1.4).

S1.1.1 Military Standards:
MIL-STD-129 Standard for Marking for Shipment and Storage
MIL-C-52950 Specification for Crates, Wood, Open, and Covered

S1.1.2 Federal Standards:
PPP-B-601 Specification for Boxes, Wood, Cleated-Plywood
PPP-B-621 Specification for Boxes, Wood, Nailed and Lock Corner
PPP-T-97 Specification for Tape, Packaging/Individual, Filament Reinforced

S1.1.3 Official Classification Committee Standard:
Uniform Freight Classification Ratings, Rules, and Regulations

S1.1.4 National Motor Freight Traffic Association Standard:

4 Available from Standardization Documents, Order Desk, Bldg. 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, Attn: NPQDS.
6 Available from Uniform Classification Committee Agent, Tariff Publication Officer, Room 1106, 222 S. Riverside Plaza, Chicago, IL 60606.
S2.1.2.2 Table S1.1 shall be applied separately to major and minor defects (see Table S2.1) for purpose of lot acceptance and rejection.

S2.2 Examination—Rat guards selected in accordance with S2.1.2 shall be examined as specified in Table S2.1 and measured to verify conformance to the requirements of this specification.

S2.3 Trial Assembly—Rat guards selected in accordance with S2.1.2 shall be assembled in the specified dimensional size to verify conformance with the functional requirements of this specification.

S2.4 Inspection of Packaging—Sample packages and packs, and the inspection of the preservation-packaging, packing, and product marking for shipment and storage shall be in accordance with the requirements of Sections 8, 9, and S3, and the documents specified therein.

**S3. Packaging and Package Marking**

**S3.1 Preservation (Type III only)—**Preservation shall be Level A or C, as specified (see 4.1.4).

**S3.1.1 Level A:**
- Preservatives shall not be used.

**S3.1.2 Level B**—Rat guards selected in accordance with S2.1.2 shall be nested together by disassembling each guard and securing the two halves together at the funnel with filament reinforced pressure sensitive tape conforming to PPP-T-97. The hinge bolt, nut, and washer for each guard shall be secured to one half of the guard to prevent loss or damage.

**S3.2 Level C**—Rat guards, assembled or disassembled at the contractor’s option, shall be unit packed to afford protection against damage during shipment from the supply source to the first using activity for immediate use. The contractor’s retail or wholesale preservation methods may be used when such meets the requirements of this level.

**S3.2.1 Level A**—Eight rat guards (for Type III, eight disassembled rat guards) unit packed as specified in S3.1 shall be packed in wood cleated plywood, nailed wood, or open wood crates conforming to PPP-B-601 overseas type, PPP-B-621 class 2, or MIL-C-52950 boxes or crates respectively. Selection of the box or crate shall be at the option of the contractor. Protection shall be provided by means of blocking, bracing, or cushioning, or other media to prevent damage during handling, shipment, and storage.

**S3.2.2 Level B**—Eight rat guards (for Type III, eight disassembled rat guards) unit packed as specified in Level A, except that containers shall conform to the domestic class or grade of the type used.

**S3.2.3 Level C**—Packing shall be accomplished in a manner that will ensure acceptance by common carrier at the lowest rate and will afford protection against physical or mechanical damage during direct shipment from the supply source to the using activity for early installation. The shipping containers or method of packing shall conform to the Uniform Freight Classification Rules, National Motor Freight Classification, or other carrier regulations, as applicable to the mode of transportation.

**S3.3 Product Marking**—In addition to any special marking required (see 4.1.4), unit packs and shipping containers shall be marked in accordance with MIL-STD-129. Unit packs in open crates shall be marked with waterproofed tags.

**S3.3.1** When specified (see 4.1.4), manufacturers shall assign a part number containing a five digit numeral manufacturer’s code as assigned by the U.S. government under the Federal Cataloging Program.

**S3.3.2** When specified (see 4.1.4), the marking specified in 8.1 shall include a National Stock Number.

**Note:** The packaging requirements specified apply only for direct government acquisition.

---

Standard Specification for
Warping Heads, Rope Handling (Gypsy Head, Capstan Head) ¹

1. Scope
1.1 This specification covers warping heads used with windlass, winch, and capstan drive units to pull rope on board ships. Warping heads are primarily for use with fiber rope, natural, or synthetic.
1.2 Warping heads with external ribs or whelps on the barrel, notched flanges, attached storage drums, unfinished drums, or non heat-treated fabrications, are considered special and are permitted within the scope of this specification when fully described under special ordering information.
1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents
2.1 ASTM Standards:
A 27/A 27M Specification for Steel Castings, Carbon, for General Application ²
A 36/A 36M Specification for Carbon Structural Steel ³

A 148/A 148M Specification for Steel Castings, High-Strength, for Structural Purposes ²
A 501 Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing ⁴
A 724/A 724M Specification for Pressure Vessel Plates, Carbon-Manganese-Silicon Steel, Quenched and Tempered, for Welded Layered Pressure Vessels ³
A 735/A 735M Specification for Pressure Vessel Plates, Low-Carbon Manganese-Molybdenum-Columbium Alloy Steel, for Moderate and Lower Temperature Service ³
E 10 Test Method for Brinell Hardness of Metallic Materials ⁵
2.2 AWS Standard:
D 1.1 Structural Welding Code ⁶
2.3 ANSI Standard:
ASA B 46.1 Surface Texture ⁷
2.4 Military Standards:
Fed-Spec T-R-605 Manila, Three Strand ⁸
MIL-R-24050 Nylon, Double Braided ⁸

3. Definitions of Terms Specific to This Standard
3.1 barrel—cylindrical or conical midbody portion of a warping head.
3.1.1 Discussion—The barrel may have a uniform diameter through the length or may be tapered from one end to the other.
3.2 flanges—circumferential rims at the ends of the barrel used to retain wraps of rope on the barrel portion of the warping head.
3.3 rope contact surfaces—portions of the barrel, flanges, and connecting fillets that a rope will contact when led in tangent to the barrel and normal to the shaft centerline, wrapped around the barrel, and led away tangent to the barrel as in normal use. (See Fig. 1 and Fig. 2.)
3.4 warping head (also known as a gypsy head or capstan head)—cylindrical or conical rotating member to receive multiple wraps of rope around the circumference of the member and of suitable strength to impart a pulling motion to the rope by friction contact when the member is rotated.

4. Classification
4.1 The size of the warping head shall be identified by the nominal barrel diameter measured at the smallest point of the barrel.
4.2 Warping heads under this specification are furnished in two types as follows:
4.2.1 Type I Warping Head With Cylindrical Barrel—Generally used in but not restricted to horizontal shaft applications. Also known as a gypsy head (see Fig. 1).

¹ This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting.

⁴ Annual Book of ASTM Standards, Vol 01.01.
⁵ Annual Book of ASTM Standards, Vol 03.01.
4.2.2 Type II Warping Head With a Conical Barrel—Mounted with the large end of the barrel toward the drive machinery. Generally used in but not restricted to vertical shaft applications. Also known as a capstan head (see Fig. 2).

4.3 Warping heads are divided into four grades as follows:

4.3.1 Grade 1—Fabricated from any combination of structural steel plate, pipe, tubing, or steel castings and joined by electric welding.

4.3.2 Grade 2—Cast from mild to medium strength steel.

4.3.3 Grade 3—Fabricated from any combination of steel plate or steel castings and joined by electric welding. Heat treated to provide a surface hardness (1/8 in. (3 mm) deep) of 200 to 250 Brinell on rope contact surface. Rope contact surface finished to an average 125- to 160-µin. (3175- to 4064-µmm) finish.

4.3.4 Grade 4—Cast from high strength steel castings and heat treated to provide a surface hardness (1/8 in. (3 mm) deep) of 200 to 250 Brinell on rope contact surface. Rope contact surface finished to an average 125- to 160-µin. (3175- to 4064-µmm) finish.

4.4 When required by ordering information, an accessory cover will be provided to cover the open end of the warping head.

5. Ordering Information

5.1 Orders for warping heads under this specification shall include the following:

5.1.1 Quantity (number),
5.1.2 ASTM designation and year of issue,
5.1.3 Size (barrel diameter),
5.1.4 Type (I or II),
5.1.5 Grade (1, 2, 3, or 4),
5.1.6 As-cast or machined dimensions for warping head bore, hub length and location, hub puller holes, and shaft keying,
5.1.7 Requirement for optional accessory cover on open end of warping head (see 4.4),
5.1.8 Special features required (ribs or whelps on barrel, notched flanges, and attached storage drums), and
5.1.9 Product marking (shipping).

6. Material and Manufacture

6.1 Material for Grade 1 warping heads shall conform to Specification A 36/A 36M or Specification A 27/A 27M for barrel, flanges, hubs, and structural webs or diaphragms. Materials conforming to Specifications A 53 or A 501 may be used as an alternate for the barrel. Component parts may be formed by rolling or flanging, and joined by electric welding in accordance with ASW D1.1. Warping head weldment shall be stress relieved.

6.2 Material for Grade 2 warping heads shall conform to Specification A 27/A 27M annealed.

6.3 Material for Grade 3 warping heads shall conform to Specifications A 148/A 148M, A 724/A 724M Grade B, or Specification A 735/A 735M Class 4. Component parts may be formed by casting, rolling or flanging, and joined by electric welding, in accordance with AWS D1.1. Warping head weldment shall be stress relieved and heat treated for a surface hardness (1/8 in. (3 mm) deep) of 200 to 250 Brinell on rope contact surface. Rope contact surface finished to an average 125- to 160-µin. (3175- to 4064-µmm) finish.

6.4 Material for Grade 4 warping heads shall conform to Specification A 27/A 27M annealed.

6.5 When required by ordering information, an accessory cover will be provided to cover the open end of the warping head.

6.6 When required by ordering information, an accessory cover will be provided to cover the open end of the warping head.
hardness (1/8 in. (3 mm) deep) of 200 to 250 Brinell on rope contact surface, in accordance with hardness Test Method E 10. Rope contact surfaces shall be finished in accordance with 8.7.

6.4 Material for Grade 4 warping heads shall conform to Specification A 148/A 148M quenched and tempered for a surface hardness (1/8 in. (3 mm) deep) of 200 to 250 Brinell on rope contact surface in accordance with hardness Test Method E 10. Rope contact surfaces shall be finished in accordance with 8.7.

6.5 The manufacturer’s name or identification mark, ASTM specification number, and pattern, part, or drawing number shall be cast molded or die stamped on the warping head, using minimum 1/2 -in. (13-mm) size characters. The marking shall not be on the rope contact surface and shall be readily available for identification on an assembled windlass, winch, or capstan.

6.6 Structural webs and diaphragms between the hub and barrel shall completely seal and void internal portions of the warping head against the entry of water or provide complete self-drainage and maintenance access to internal portions. When present, voids shall be treated with preservative or primer paint.

6.7 An accessory cover, when required by the purchase order, shall be provided to cover the open end of the warping head opposite the drive shaft. Material shall be cast or wrought, steel or bronze. The cover shall be flat or domed and attached with corrosion-resistant fasteners (brass or monel), without projections that could snag or cut a slack rope and with provision for locking to prevent loosening under vibration. When the cover forms a void, a gasket shall be provided to seal against the entry of water.

7. Dimensions, Mass, and Permissible Variations

7.1 Principal dimensions, tolerances, and strength requirements for Types I and II are shown in Fig. 1 and Fig. 2, respectively. These requirements are considered standard and will govern unless special features are required and described (see 5.1.8).

7.2 Commonly acceptable warping head sizes for various fiber ropes are shown in Table 1 for general guidance only. The use of five wraps when using manila fiber rope is accepted practice. Some synthetic fiber ropes, because of reduced friction, require additional wraps. The equivalent sizes of synthetic fiber ropes shown in Table 1 are reduced on the basis of breaking strength and provide additional space on the barrel for increased wraps.

7.3 The strength of the barrel, flanges, webs, and diaphragms shall withstand the maximum rope pull shown in Fig. 1 and Fig. 2, applied tangent to the barrel, normal to the shaft, at the midpoint of the barrel, and wrapped around the barrel, with the combined stress not exceeding 75 % of the tensile yield point of the material. Compressive forces on the barrel, torsional shear forces between hub and barrel, and the wedging forces against the flanges, shall be considered. This requirement does not imply a similar requirement for drive horsepower or brake capacity in the drive unit.

8. Workmanship, Finish, and Appearance

8.1 Welds shall be extended around ends of members and be free of pockets and irregularities that would tend to trap water.

8.2 Welds shall be ground flush to match the surrounding surface in areas of rope contact.
8.3 Component parts, formed by rolling or flanging, shall be visually examined during fabrication to ensure freedom from cracks.

8.4 Castings shall be smooth, of fine grain, and free of cracks, hot tears, and blow holes, detrimental to end use.

8.5 Castings shall have all flash material, vents, and gates removed and ground flush to match the surrounding surfaces.

8.6 Weldments and castings shall be free of sharp edges and burrs that could cut or snag fiber rope coming in contact with any accessible portion of the rotating warping head.

8.7 Rope contact surfaces of Grades 3 and 4 warping heads shall be finished to an average surface roughness of 125 to 160 µin. (3175 to 4064 µmm) in accordance with ANSI Standard ASA B46.1.

Note 1—Local flaws (holes) no larger than ³⁄₈ in. (4.7 mm) in diameter are acceptable when they have no sharp edges or burrs that would cut fiber rope, providing the total area of flaws (holes) does not exceed 5% of the total rope contact surface.

8.8 Weldments and castings shall be cleaned by sand blasting, shot blast, or equivalent methods to remove all loose scale or slag.

9. Inspection

9.1 The completed warping head shall be visually inspected for workmanship, dimensions, surface hardness (when applicable), finish and appearance, after cleaning.

10. Product Marking

10.1 Shipping—Each warping head, when furnished as a separate component, shall be marked with the ASTM standard designation, type and grade, purchase order, and item number. Product marking shall be by paint or weatherproof tag.

11. Packaging and Package Marking

11.1 Warping heads, when furnished as a separate component, shall be crated, skidded, or attached to a pallet in a manner acceptable for handling by common carrier. When warping head is furnished with machined bore or hub, machined surfaces shall be protected against corrosion in open weather storage for a period of at least one year.

12. Keywords

12.1 berthing ship; capstan drive units; capstan head; capstan windlass; gypsyhead; mooring ship; rope handling; warping head winch; warping ship; windlass

Notes:

1. The following table is provided for guidance subject to variations in breaking strengths and friction characteristics of specific ropes. Breaking strengths of ropes used should not exceed the maximum rope pull shown for the warping head size selected.

2. Other rope constructions and materials are not listed in the absence of recognized standard breaking values.

3. 1 in. = 25.4 mm.

Standard Specification for
Circular Metallic Bellows Type Expansion Joints for Piping Applications

This standard is issued under the fixed designation F 1120; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope
1.1 This specification establishes the minimum requirements for the mechanical design, manufacture, inspection, and testing of circular metallic bellows-type expansion joints used to absorb the dimensional changes resulting from piping thermal expansion or contraction, as well as the movement of terminal equipment and supporting structures.
1.2 Additional or better features, over and above the minimum requirements set by this specification, are not prohibited by this specification.
1.3 The layout of many piping systems provides inherent flexibility through natural changes in direction so that any displacements produce primarily bending or torsional strains, within acceptable limits. Where the system lacks this inherent flexibility the designer should then consider adding flexibility through the use of metallic bellows-type expansion joints.
1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

Section IX, Welding and Brazing Qualifications
2.3 EJMA Standard:
Standards of the Expansion Joint Manufacturer’s Association

2.4 Pipe Fabrication Institute Standard:
ES-3 Fabrication Tolerances

3. Terminology Definitions
3.1 Expansion joint definitions shall be in accordance with those in the EJMA standards.
3.2 double expansion joint—expansion joint consisting of two bellows joined by a common connector.
3.3 Discussion—The common connector is anchored to some rigid part of the installation by means of an anchor base. The anchor base may be attached to the common connector either at installation or at time of manufacture. Each bellows acts as a single expansion joint and absorbs the movement of the pipe section in which it is installed independently of the other bellows.
3.4 gimbal expansion joint—expansion joint designed to permit angular rotation in any plane by the use of two pairs of hinges affixed to a common floating gimbal ring.
3.5 Discussion—The gimbal ring, hinges, and pins are designed to restrain the thrust of the expansion joint as a result of internal pressure and extraneous forces, where applicable.
3.6 hinged expansion joint—expansion joint containing one bellows designed to permit angular rotation in one plane only by the use of a pair of pins through hinge plates attached to the expansion joint ends.
3.7 Discussion—The hinges and hinge pins are designed to restrain the thrust of the expansion joint as a result of internal pressure and extraneous forces. Hinged expansion joints should be used in sets of two or three to function properly.
3.8 pressure balanced expansion joint—expansion joint designed to absorb axial movement or lateral deflection, or both, while restraining the pressure thrust by means of tie devices interconnecting the flow bellows with an opposed bellows also subjected to line pressure.
3.9 Discussion—This type of expansion joint is intended for use where a change of direction occurs in a run of piping. The flow end of a pressure balanced expansion joint sometimes

4 Available from Expansion Joint Manufacturer’s Association, 25 N. Broadway, Tarrytown, NY 10591. The Standards of the Expansion Joint Manufacturer’s Association are a collection of standards developed by this industry and published in one volume, herein called EJMA Standards.
5 Available from Pipe Fabrication Institute, 1326 Freeport Rd., Pittsburgh, PA 15238.
contains two bellows separated by a common connector, in which case it is called a universal pressure balanced expansion joint.

3.10 single expansion joint—simplest form of expansion joint, consisting of single bellows construction, designed to absorb all movement of the pipe section in which it is installed.

3.11 swing expansion joint—expansion joint designed to absorb lateral deflection or angular rotation, or both, in one plane.

3.12 Discussion—Pressure thrust and extraneous forces are restrained by the use of a pair of swing bars, each of which is pinned to the expansion joint ends.

3.13 universal expansion joint—expansion joint containing two bellows joined by a common connector for the purpose of absorbing any combination of axial movement, lateral deflection, and angular rotation.

3.14 Discussion—Universal expansion joints are usually furnished with control rods to distribute the movement between the two bellows of the expansion joint and stabilize the common connector.

4. Ordering Information

4.1 An expansion joint is a unique product and must be specifically designed for the intended service. It is the responsibility of the piping system designer to supply sufficient engineering data necessary for the complete design. The information compiled by the piping system designer must be complete and contain all pertinent data detailing the conditions under which the expansion joint is expected to operate.

4.2 Orders for each expansion joint shall include the following information:

4.2.1 Title, designation number, and latest revision of this specification.

4.2.2 Size—The nominal pipe diameter or specific ducting diameter.

4.2.3 Type of Expansion Joint—single, double, universal, guided, hinged, gimbal, swing, or pressure balanced.

4.2.4 Flow Characteristics:

4.2.4.1 Flow Medium—indicate whether the medium is gas or liquid.

4.2.4.2 Flow velocity, medium density, or viscosity, or combination thereof.

4.2.4.3 Flow direction.

4.2.5 Pressure in psig (N/mm²)—design, operating, and test pressures.

4.2.6 Temperature in °F (°C)—design, operating, and installation temperatures.

4.2.7 Movement—axial (extension, compression); lateral (single plane, multiplane); angular; torsional (to be avoided). Differentiate between start-up, operational, or field installation tolerance movements.

4.2.8 Materials—Material types (including that for the bellows) shall be specified by the purchaser (see 5.1 for material restrictions).

4.2.9 Internal Liner—Liner shall be specified when needed because of flow velocity or other flow conditions. Specific criteria for liners is shown in Section C-3 of the EJMA Standards (see 6.6).

4.2.10 External Cover—To protect personnel having close access to the bellows, when thermal insulation is to be added in the field, or when external mechanical damage is possible (see 6.5).

4.2.11 End Fittings—The type of end connections such as flanged, threaded, or others to match the mating piping or terminal equipment.

4.2.12 Accessories—Specify what accessories are required and the conditions under which they operate. Consider items such as insulation lugs, tie, limit, or control rods, pantographic linkages, trunnions, gimbal, drains, purge connections, anchor bases, and interply monitoring devices.

4.2.13 Dimensional Limitations—If space limitations exist, specify the maximum overall length, maximum outside diameter, minimum inside diameter, and installation tolerances.

4.2.14 Operating Forces—Specify calculated bellows spring forces and pressure thrust forces if they are required for subsequent anchor design or other piping systems analysis. If there are maximum allowable values, these must also be specified.

4.2.15 Installation Position—horizontal, vertical (flow up or down). Specify if liner drainage holes are required.

4.2.16 Cycle Life Requirements—Specify an anticipated number of thermal cycles over the intended life of the expansion joint.

4.2.17 Testing Requirements—Specify testing requirements in addition to the hydrostatic test required by 9.4 (for example, vacuum testing, testing at operating temperature).

4.2.18 Inspection Requirements—Specify inspection requirements in addition to the inspection required by Section 9 (that is, radiographic, fluorescent penetrant, or mass spectrometer).

4.2.19 Piping Code Requirements—Specify any piping or design code that must be used as the basis for design in addition to those specified in 5.2.

4.2.20 Special Requirements—Specify the magnitude of special system conditions such as vibration, shock, or hydraulic surge.

4.2.21 Shipping Requirements—Specify whether special packing is required including protection for extended outside storage, export handling, or special lifting considerations for heavy or large assemblies.

4.2.22 Piping Drawing—In addition to specifying the above information it would be beneficial to provide a drawing of the proposed piping system.

4.2.23 Supplementary Requirements—Specify any additional requirements not identified herein.

4.3 Fig. 1 and Fig. 2 should be used as a guide in ordering expansion joints to this specification.

5. Materials and Manufacture

5.1 Materials:

5.1.1 Pressure-containing parts shall be manufactured from material specifications and grades listed in Section VIII, Division 1, of the ASME Code or ANSI B31.1. End connection material shall have in service properties similar to the bellows material. Flanges shall meet ANSI B16.5.

5.1.2 All other materials of construction shall be of the type specified by the user and shall conform to an ASTM or ASME

**Note:** The table continues with more entries, providing detailed specifications for expansion joints, such as design pressures, test pressures, maximum installation movements, maximum design movements, operating fluctuations, materials of construction, and quality assurance requirements. The table is comprehensive, covering aspects from temperature and pressure specifications to structural and installation details, ensuring a thorough understanding of the joint specifications as per the standard F 1120 – 87 (1998).
FIG. 2 Supplemental Specification Sheet (To Be Used With Standard Expansion Joint Specification Sheet)
material specification. Materials not identified by the ordering data shall be of the manufacturer’s standard and of the same quality used for the intended purpose in commercial practice.

5.1.3 Materials used shall be free from defects that would adversely affect the performance of the expansion joint.

5.1.4 All material incorporated in the work covered by this specification shall be new. The use of rebuilt or used products is not allowed under this specification.

5.1.5 Materials for hinge or gimbal hardware, or other sliding parts, shall be chosen to minimize galling of the contacting parts.

5.2 Manufacture:

5.2.1 Expansion joints shall be designed and fabricated in accordance with requirements set forth in the ordering data and the EJMA Standards.

5.2.2 Nonstandard flanges shall be designed and fabricated in accordance with Appendix 2 of Section VIII, Division 1, of the ASME Code. Flanges machined from plate shall not be used at pressures exceeding 150 psi (1034 kPa) and temperatures exceeding 450°F (232°C). Hubbed flanges machined from plate or bar stock shall meet the requirements of Appendix 2, Paragraph 2-2(d) of Section VIII, Division 1, of the ASME Code.

5.2.3 All welding shall be accomplished in accordance with ANSI B 31.1.

5.2.4 Welding personnel and welding procedures shall be qualified in accordance with the applicable sections of Section IX of the ASME Code.

5.2.5 All fabrication details not covered by the referenced codes and standards shall be taken from the appropriate ANSI standard. If no standard applies, accepted industry practice shall govern.

5.2.6 The bellows shall be of tested and proven convolution geometry.

6. Other Requirements

6.1 The details of design, material supply, fabrication, and testing of the complete product are the responsibility of the manufacturer unless specific details are requested by the purchaser.

6.2 The specified normal operating movements (axial, lateral, and angular) shall be available concurrently. The specified lateral and angular movements shall be available on either side of the expansion joint centerline.

6.3 Internal sleeves, external covers, and all attached hardware shall be constructed so as not to interfere with adjacent parts when the joint is in the fully deflected position.

6.4 Universal expansion joints shall be designed and fabricated to be self-supporting and not require any external structure for the support of the center pipe spool piece and its contents.

6.5 Expansion joints to be installed in systems above 150°F (66°C) shall have an external cover. When external mechanical damage is possible, a cover shall be fabricated to protect the joint and personnel.

6.6 Internal sleeves shall be installed in expansion joints when the fluid velocity of the system, where the expansion joint is to be installed, is greater than the values listed in Section C-3.1 of the EJMA Standards and where the flow velocity exceeds 75% of the velocity calculated using Section C-3.1.4 of the EJMA Standards.

7. Dimensions and Permissible Variations

7.1 Dimensional tolerances on completed expansion joint assemblies shall be in accordance with Section D-2.9 of the EJMA Standards and Standard ES-3 of the Pipe Fabricating Institute.

8. Workmanship, Finish, and Appearance

8.1 The quality of workmanship shall be such as to produce a product that is in accordance with the requirements of this specification and ensures the proper functioning of all parts of the unit.

8.2 The bellows shall be manufactured and carefully handled to prevent surface flaws or deep scratches from being generated. The surface condition of the completed joint assembly shall be free from injurious surface discontinuities and any contaminants that would affect the operation of the assembly.

8.3 On completion of fabrication, and before shipment, the manufacturer shall clean the inside and outside of the completed assembly of all loose scale, grease, dirt, sand, rust, weld spatter, cutting chips, and any other foreign matter by any suitable means. The inside of the assembly shall then be inspected for cleanliness. All openings where practicable shall be suitably closed to prevent the entrance of foreign matter after cleaning and during shipment. The use of chlorinated solvents is prohibited.

9. Inspection

9.1 The responsibility for quality control rests with the manufacturer. However, all phases of fabrication may be subject to review by a representative of the purchaser.

9.2 The inspector representing the purchaser shall have access at all times, while work on the contract of the purchaser is being performed, to all parts of the manufacturer’s plant that concern the manufacture of the product ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the product is being furnished in accordance with this specification. Inspection shall be made at the place of manufacture before shipment, unless otherwise specified, and shall be scheduled not to interfere unnecessarily with the operations of the manufacturer. This requirement applies to all subcontractors.

9.2.1 Acceptance of a particular phase of manufacturer of an assembly by a purchaser’s representative shall not be considered a waiver of any of the requirements of this specification and shall not relieve the manufacturer of the responsibility of furnishing a satisfactory product.

9.3 When the bellows is formed from a longitudinally butt-welded cylinder, the longitudinal weld(s) shall be 100% liquid penetrant examined on the outside and inside surfaces (if accessible) before forming. Liquid penetrant examination on all accessible inside and outside weld surfaces shall be repeated after forming. All other welds essential to pressure containing or restraining shall be liquid penetrant examined. Ferromagnetic materials may be examined by magnetic particle inspection instead of liquid penetrant at the manufacturer’s option.
10. Rejection and Rehearing

10.1 Expansion joint assemblies or parts thereof indicating fabrication not in accordance with the manufacturing drawings and procedures, or this specification, shall be subject to rejection and shall be resolved in accordance with the manufacturer’s quality assurance program (see Section 14).

10.2 All repairs shall be in accordance with the specified code and other applicable specifications.

10.3 Expansion joint assemblies or parts thereof accepted by the purchaser’s representative at the place of manufacture that subsequently reveal imperfections not previously detected or which by subsequent tests or analysis show nonconformance with this specification are subject to rejection.

11. Certification

11.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser. It shall state that each expansion joint has been manufactured, tested, and inspected in accordance with this specification and the requirements have been complied with. When specified, a report of any test results shall be furnished.

11.2 When specified, certification of the conformance to the requirements of this specification may be made by a third party.

11.3 ASTM/ASME mill test reports are required for pressure retaining and containing components.

11.4 No records are required for pipe fittings or flanges provided they are made and marked in accordance with an acceptable standard (such as ANSI). Certificates of conformance are required when the markings are missing or are removed during fabrication.

12. Product Marking

12.1 Each expansion joint shall be provided with a permanently attached corrosion resistant nameplate indicating as a minimum the following information:

12.1.1 Manufacturer’s name.

12.1.2 Manufacturer’s model number.

12.1.3 Design Conditions—pressure, temperature, movements.

12.1.4 This specification number (indicating compliance thereto).

12.1.5 Purchaser’s specified component item number, if ordered.

12.2 When an expansion joint is supplied with an internal liner, a permanent arrow indicating the direction of flow shall be plainly visible on the outside of the expansion joint.

12.3 Impression stamping directly on bellows material is not permitted.

13. Packaging and Shipping

13.1 The expansion joint shall be containerized or shipped on pallets with all materials strapped down and prepared for shipment in such a manner that the quality, cleanliness, and finish shall be maintained during shipment.

13.2 Yellow painted shipping bars shall be furnished to maintain proper shipping length and alignment, and designed not to interfere with the installation of the assembly. The shipping bars shall be removed after installation and before piping system test. Expansion joints with tie rods can be provided with tie rod spacers instead of shipping bars.

13.3 Installation instructions shall be supplied in a weatherproof envelope with each expansion joint assembly.

13.4 When the expansion joint is to be transported to the job site by ship, it should preferably be sent as below deck cargo.

13.5 All external surfaces shall be treated and painted in accordance with the manufacturer’s standard practices, unless otherwise specified. Paint shall be suitable for service temperatures.

14. Quality Assurance

14.1 The manufacturer shall have a current certificate of authorization to manufacture ASME Section VIII, Division 1, Pressure Vessels to assure an adequate quality assurance program that is applicable to all phases of manufacturing, including materials supplied by subcontractors.

14.2 Nothing in this specification shall relieve the manufacturer of the responsibility for performing, in addition to the requirements of this specification, such analyses, tests, inspections, or other activities that the manufacturer considers necessary to ensure that the design, material, and workmanship are satisfactory for the service intended, or as may be required by common usage or good practice.

15. Keywords

15.1 expansion joint; metallic bellows-type expansion joints; piping systems; piping thermal contraction; piping thermal expansion
SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements are for use when desired by the purchaser. Other requirements not identified in this specification may be included by agreement between the manufacturer and the purchaser.

S1. Documents for Approval and/or Records

S1.1 Manufacturing drawings.
S1.2 Welding procedures and qualifications.
S1.3 Applicable nondestructive examination procedures.
S1.4 Heat treatment procedures or temperature charts, or both.
S1.5 Complete engineering design analysis calculations for the metallic bellows or hardware, or both.
S1.6 ASME partial data forms.

S2. Qualification Testing

S2.1 When specified, the manufacturer shall furnish a first article test assembly to determine conformance with this specification. The test assembly shall consist of the bellows and appropriate end connections. Liners, covers, tie, limit or control rods, hinges, gimbal rings, and other similar devices need not be provided on the first article test unit, unless they are necessary for the performance of the specific test(s) verification.

S2.2 When specified, cyclic endurance testing (fatigue testing) shall be performed for the required number of complete cycles. The test shall be performed under pressure at ambient temperature and the assembly need be cycled in axial movement only.

S2.2.1 During the test, the pressure in the assembly shall be adjusted to simulate, as closely as possible, the maximum design pressure of the unit being qualified. The pressure may vary from this value during each cycle.

S2.2.2 A single test bellows can be used instead of a multiple bellows assembly being qualified.

S2.2.3 In determining the qualifying extension or compression, or both, the equivalent axial movement caused by lateral deflection and angular rotation shall be included. The equivalent axial movement shall be computed in accordance with the EJMA Standards and shall be algebraically added to the specified values of axial movement.

S2.3 The purchaser may require that the expansion joint be certified as passing shock requirements. The shock requirements shall be specified by the purchaser.

S2.3.1 The purchaser may require that the expansion joint be certified as passing vibration requirements. The vibration requirements shall be specified by the purchaser.

S2.3.2 When specified, other qualifying tests shall be performed on a first article test unit under the requirements of the purchaser’s contract.
Standard Specification for International Shore Connections for Marine Fire Applications

1. Scope

1.1 This specification covers the design and manufacture of international shore connections to be used with marine fire fighting systems during an emergency when a stricken ship has a system failure.

1.2 International shore connections are portable universal couplings that permit connection of shipboard firemain systems between one ship and another or between a shore facility and a ship when their respective system threading is mismatched. Both the ship and the facility are expected to have a fitting such that in an emergency can be attached to their respective fire hose and bolted together to permit charging the ship’s system. It must be portable to accommodate hose to hose connection and allow assistance from any position.

1.3 The international shore connection is required by international treaty2,3 to be carried onboard all passenger and cargo vessels of 500 gross tons or more, regardless of firemain size, engaged in international voyages, and is recommended for all vessels that would be expected to render assistance. It is also intended to be provided at shore facilities that would be used to supply water to a ship’s firemain system.

1.4 Fabrication either on board a vessel, in a shipyard, or other shore facility is not precluded by this specification.

1.5 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Ordering Information

2.1 The purchase order or inquiry for an international shore connection shall include the following as applicable:

2.1.1 Material of construction.
2.1.2 Title, number, and latest revision of this specification.
2.1.3 Maximum operating pressure (psig) (when above 150 psig, see 4.2).
2.1.4 Preservation (coating) requirements (if any, see 7.2).
2.1.5 Diameter and threading to be provided in the coupling.

3. Materials and Manufacture

3.1 The international shore connection may be machined from forgings, castings, plate or bar stock, or may be fabricated out of more than one piece.

3.2 The material shall be brass, bronze, or other suitable corrosion-resistant material. When fabricated out of more than one piece, the flange may be steel and the coupling a corrosion-resistant material. Aluminum shall not be used.

3.3 Nuts, bolts, and washers shall be a corrosion-resistant material.

4. Other Requirements

4.1 Design:

4.1.1 The connection shall consist of a flat face flange and a threaded coupling. Threading shall be specified by the purchaser.

4.1.2 The dimensions of the international shore connection shall be in accordance with Fig. 1.

4.2 The maximum allowable working pressure (MAWP) shall be at least 150 psig (1 N/mm²).

4.3 The international shore connection shall be supplied with four bolts, ¾ in. (16 mm) in diameter, at least 2 in. (50 mm) in length, and threaded at least to within 1 in. (25 mm) of the bolt head.

4.3.1 The bolts shall be supplied with four corresponding nuts and eight washers.

4.4 The international shore connection shall be supplied with a flange gasket suitable for the MAWP and seawater service.

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

International Maritime Organization Assembly Resolution A, XII 470, Jan. 4, 1987. This document is available from International Maritime Organization, 4 Albert Embankment, London, U.K. SE1 7SR.
5. Workmanship, Finish, and Appearance

5.1 The quality of workmanship shall be such as to produce a product that is in accordance with the requirements of this specification. Completed units shall be free from imperfections or defects that materially affect appearance or that may affect serviceability.

6. Inspection

6.1 Each finished international shore connection shall be visually examined and dimensionally checked to ensure it corresponds to this specification.

7. Packaging and Preservation

7.1 Unless otherwise specified, the international shore connection shall be packaged for shipment in accordance with the manufacturer's standard commercial practice.

7.2 Preservation of the international shore connection, by the manufacturer or user, shall be satisfactory for preventing deterioration of the connection during long-term storage on vessels or at shore facilities.

8. Quality Assurance

8.1 The manufacturer shall use quality assurance procedures that assure manufacture of high quality international shore connections that are designed in accordance with this specification.

9. Keywords

9.1 fire fighting systems; international shore connections; hose-to-hose connection; marine fire applications; portable universal couplings; shipboard firemain systems; stricken ship

**FIG. 1 International Shore Connection**

NOTE 1—Fire hose coupling may be used.

NOTE 2—For 1½-in. fire hose coupling, the radius will be ¾ in.

NOTE 3—1 in. = 25.4 mm.
Standard Specification for Quick Disconnect Couplings

This standard is issued under the fixed designation F 1122; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the manufacturing data required to produce a variety of styles and sizes of quick disconnect couplings for marine use that ensure interchangeability and safety of operation.

1.2 In general, quick disconnect couplings are hose and pipe end fittings that permit quick mechanical attachment by means other than bolted or threaded fittings. The method of attachment is a male coupling half (adapter) that fits into a female coupling half (coupler) of the same size. By closing attached cam handles, the coupling halves seal, permitting fluids to be transported under pressure through the quick disconnect coupling.

1.3 The values stated in this specification are in inch-pound units with SI units given in parentheses. The values of each system may not be exact equivalents. Therefore, each system should be considered separately.

1.4 The following safety hazards caveat pertains only to the test method described in this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ANSI Standards:
B2.1 Pipe Threads
B16.5 Pipe Flanges and Flanged Fittings, Steel-Nickel Alloy, and Other Special Alloys
B16.24 Bronze Pipe Flanges and Flanged Fittings
B16.42 Ductile Iron Pipe Flanges and Flanged Fittings
B31.1 Power Piping Code

2.2 MSS Standards:
MSS-SP-6 Standard Finish for Contact Faces of Pipe Flanges and Connecting End Flanges of Valves and Fittings
MSS-SP-25 Standard Marking System for Valves, Fittings, Flanges, and Unions
MSS-SP-55 Quality Standard for Steel Castings for Valves, Flanges, and Fittings and Other Piping Components (Visual Method)

2.3 ASME Standards:
Section VIII, Division 1, Pressure Vessels
Section IX, Welding and Brazing Qualifications

3. Definitions of Terms Specific to This Standard

3.1 adapter—one half of a quick disconnect coupling that fits into the coupler and seals against an elastomer gasket positioned inside the coupler.

3.2 cam handles—handles that are assembled to the coupler half which by closing engages the adapter sealing the coupling.

3.3 coupler—one half of a quick disconnect coupling that receives the adapter. This half contains the sealing gasket and cam handles (see Fig. 1).

NOTE 1—See Fig. 2 for a description of typical coupler pipe fittings.

4. Classification

4.1 Quick disconnect couplings shall consist of the following types:

4.1.1 Standard Class—This type is to be designed for a 4:1 burst factor of safety.

4.1.2 Class I—This type is to be designed for a 5:1 burst factor of safety.

4.2 Both Standard Class and Class I will be called quick disconnect couplings in the body of this specification unless otherwise specified.

5. Ordering Information

5.1 Purchase orders for quick disconnect couplings under this specification shall include the following applicable information:

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

3 Available from Manufacturers’ Standardization Society of the Valve and Fittings Industry, Inc., 1815 N. Fort Myers Dr., Arlington, VA 22209.

4 Available from American Society of Mechanical Engineers (ASME), ASME International Headquarters, Three Park Ave., New York, NY 10016-5990.
5.1.1 Class.
5.1.2 Size and type of each coupling half-end connection.
(Example—2- by 1½-in. NPT).
5.1.3 ASTM material designation and date including alloy specifications for the following:
5.1.3.1 Adapter and coupler halves,
5.1.3.2 Cam handle, and
5.1.3.3 Cam handle pivot pin.
5.1.4 Product or fluid in applicable system.
5.1.5 Shipping instructions.
5.1.6 Any special requirements, such as testing, coatings, and threads.

6. Materials and Manufacture

6.1 Materials:
6.1.1 Pressure-retaining parts shall be manufactured from material specifications and grades listed in Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code or ANSI B31.1.
6.1.2 All other materials of construction shall be of the type specified by the user and shall conform to ASTM, ASME, or Metal Power Industry Federation material specifications. Materials not identified by the ordering data shall be of the manufacturer’s standard and of the same quality used for the intended purpose in commercial practice.
6.1.3 All material incorporated in the work covered by this specification shall be new. The use of rebuilt or used products are not allowed under this specification.
6.1.4 Gaskets are to be produced from a compressible elastomeric material and shall be compatible with the fluid to be transferred (see 5.1.4).

6.2 Manufacture:
6.2.1 Adapters and couplers are to be produced as castings or forgings. Cam handles may be produced by casting, forging, or sintered metal processes. Established commercial processing methods are to be used to produce these parts, provided chemical and physical properties are consistent with those cataloged for the specified materials.
6.2.2 Pipe threads on the service end of couplers or adapters, when specified, shall meet ANSI B2.1.
6.2.3 Flanges on the service end of couplers or adapters, when specified, shall meet ANSI B16.5, B16.24, or B16.42.
6.2.4 Flanges shall be finish machined to specifications shown in MSS-SP-6.
6.2.5 Cam handles assembled to the coupler are to have a safety locking device to ensure against the handles being opened unintentionally or vibrating open. This locking device must require a separate, deliberate effort in the opening operation over the standard handle operation.
6.2.6 Cam handles shall be manufactured to contain the adapter within the coupler under rated pressure with no leakage occurring. The cam action shall not distort the couplers rendering the coupler unusable. The force required to close the cam handles shall be adequate to prevent leakage, but shall be easily attainable through hand operation by an average strength person. Handles should not need to be hammered closed.
6.2.7 Welding procedure qualifications, welder performance qualifications, and welding materials shall be in accordance with ANSI B 31.1 and Section IX of the ASME Code. Brazing or soldering shall not be used. Where radiography is required (see 12.1), all welds shall be butt welds.

7. Other Requirements

7.1 All couplings shall have a maximum allowable working pressure of not less than 150 psi (1034 kPa).

7.2 Maximum allowable working pressure (MAWP) for a Standard Class coupling shall be 25% of its burst pressure.

7.3 Maximum allowable working pressure for a Class I coupling shall be 20% of its burst pressure.

7.4 Burst pressure shall be determined in accordance with Section VIII, Division 1 of the ASME Code.

8. Dimensions

8.1 The dimensions and tolerances required to ensure interchangeability of adapter and coupler halves, of common sizes, shall be as given in Figs. 3-15.

8.2 Sizes as listed in the tables correspond to NPS for piping systems.

9. Workmanship, Finish, and Appearance

9.1 Couplings are to be produced with quality workmanship. Casting surface quality is to be in accordance with MSS-SP-55. Machined surfaces are to be finish machined to a 125-µin. (3175-µmm) (AA) finish or better with no porosity showing.

9.1.1 Couplings are to be free of burrs or sharp edges. Machined surfaces are to be free of nicks or scratches that may affect the sealing capabilities of the couplings.

9.1.2 Surfaces are to be sound with good appearance and true pattern. Internal surfaces, if not machined, shall be smooth, as expected from good quality casting, and free from any flaw that would render the part unsafe for its intended use.

9.2 Cam handles are to be smooth, having no burrs or sharp edges. Cam closing surface is to be continuous, providing an increasing axial pull on mating adapter until proper seating against the gasket occurs.

9.3 Defective parts are not to be repaired by welding, brazing, or any other method, to fill porosity or other flaws in the casting.

**FIG. 3** Adapter End Dimensions
9.4 Gaskets are to be produced having parallel sealing faces. Faces are not to contain any imperfections that will allow leakage to occur at working pressure.

10. Number of Tests

10.1 A prototype coupling of each size of each particular design shall be tested to determine conformance to this specification.

10.2 Each coupling shall be tested as outlined in production testing of 11.2.

11. Test Methods

11.1 Prototype testing of each size of each particular design shall be as follows. Maintain the indicated test pressures for at least 1 min without leakage.

11.1.1 Pressure test to twice the MAWP after having been cycled (connected, closed, opened, and disconnected) three times.

11.1.2 Pressure test at MAWP while applying a moment of 1000 in.-lbs (113 N·M) to one coupling half attempting to twist it loose. Reapply MAWP after the moment is removed.

11.2 Production Test—Hydrostatically test each coupling to 1.5 times MAWP.

11.3 The test apparatus for 11.2 is to be a state-of-the-art device, designed to apply internal pressure to the coupling halves with gasket in place. Dye the fluid used to apply the hydrostatic pressure to facilitate observation of leakage should leakage occur.

12. Inspection

12.1 Nondestructive examination of welds shall be performed as required by ANSI B31.1. Additionally, 100 % radiography of all welds is required for couplings equal to or greater than 4-in. (100-mm) nominal diameter and when the nominal wall thickness is greater than 0.375 in. (9.4 mm). The manufacturer is responsible for the inspection and testing of each coupling and assuring conformity to this specification. Samples selected for inspection, at least one coupling from each lot of 100 or fraction thereof, are to be dimensionally checked 100 % to verify adherence to this specification. Couplings having threads are to be inspected using proper thread gages. The entire lot of couplings is to be

FIG. 4 Coupler End Dimensions
visually checked for porosity and other flaws that could adversely affect usability of this product.

12.3 The manufacturer shall afford the purchaser’s inspector all reasonable facilities necessary to satisfy him that the material is being furnished in accordance with this specification. Inspection by the purchaser shall not interfere unnecessarily with the manufacturer’s operations. All examinations and inspections shall be made at the place of manufacture, unless otherwise agreed upon.

12.4 Other tests, when agreed upon, shall be made from material of the lots covered in the order.

13. Certification

13.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser stating that the samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When
specified in the purchase order or contract, a report of the test
results shall be furnished.

14. Product Marking

14.1 Each adapter and coupler shall be marked in accor-
dance with MSS-SP-25 including the following:
14.1.1 ASTM designation of this specification.
14.1.2 “Cl I” if it is a Class I adapter or coupler.

15. Packaging and Package Marking

15.1 The couplings shall be packed according to the manu-
facturer’s standard practice, providing reasonable care to
prevent lost or damaged parts in shipment.

15.2 Containers and packages shall be marked or tagged to
adequately identify the contents or purchaser’s order number.

16. Quality Assurance

16.1 The manufacturer of the quick disconnect couplings
shall maintain the quality of the couplings that are designed,
tested, and marked in accordance with this specification. At no
time shall a coupling be sold with this specification designation
that does not meet the requirements herein.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for Non-Metallic Expansion Joints

1. Scope

1.1 This specification provides the minimum requirements for construction, materials, performance, and dimensional requirements of arch-type non-metallic expansion joints.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following safety hazards caveat pertains only to the test method described in this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
A 395 Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures
D 1418 Practice for Rubber and Rubber Latices—Nomenclature

2.2 Federal Standard:
Code of Federal Regulations, Title 30, Chapter I, Mine Safety and Health Administration

2.3 ANSI Standards:
B16.1 Cast Iron Pipe Flanges and Flanged Fittings
B16.5 Steel Pipe Flanges and Flanged Fittings
B16.24 Bronze Flanges and Flanged Fittings

3. Terminology

3.1 Definitions:
3.1.1 floating metallic flange type—expansion joint having the tube, fabric plies, and cover brought up from the joint body to form a bead.

4. Ordering Information

4.1 Orders for products under this specification shall include the following information:

4.1.1 Inside diameter of connecting pipes (joint ID).
4.1.2 Face-to-face dimension that is the flange-to-flange dimension into which the expansion joint is to be installed.
4.1.3 Maximum and minimum operating pressure in pounds-force per square inch gage (pascals).
4.1.4 Maximum and minimum operating temperature in °F (°C).
4.1.5 Fluid to be handled.
4.1.6 This ASTM specification designation.
4.1.7 Movement data requirements (including shock or vibratory excursions if applicable).
4.1.8 Design certification burst test if required (see 9.1).
4.1.9 Hydrostatic or special tests if required (see 9.2).

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

2 Annual Book of ASTM Standards, Vol 01.02.
3 Annual Book of ASTM Standards, Vol 09.01.
5 Available from American Society of Mechanical Engineers (ASME), ASME International Headquarters, Three Park Ave., New York, NY 10016-5990.

4.1.11 Certification of expansion joint if required (see Section 12).
4.1.12 Certified detailed drawing of the expansion joint if required (see 12.2).

5. Materials and Manufacture

5.1 Expansion joints shall be fabricated with an elastomeric tube reinforced with multiple plies of woven cloth or tire cord covered with synthetic rubber. The inner tube shall be a natural rubber, synthetic rubber, or blend of synthetic rubber that meets the requirements of this specification. The woven cloth or tire cord shall be nylon, polyester, fiberglass, or aramid. Cotton is not acceptable. The reinforcing fabric shall be impregnated with a compatible friction stock. Additional reinforcement to the fabric may be provided in the body of the expansion joint and may be solid metal rings or wire imbedded in the synthetic rubber. Tensile properties of the wire, if used, shall be as given in 5.2. Body rings, if used, must be welded before being installed in the expansion joint body. Welds must be 100% penetration.

5.1.1 The list of elastomers used in expansion joints and rubber pipe in accordance with the Technical Handbook lists acceptable natural rubber and synthetic elastomers for construction of non-metallic expansion joints.

5.2 Reinforcing wire shall have properties that allow the expansion joints to meet the requirements of this specification.

5.3 All expansion joints shall be manufactured with a cover of Hypalon or Neoprene (Chloroprene), in accordance with Practice D 1418. This cover material must consist of 100% Hypalon or Chloroprene (not blended with any other elastomer) plus normal additives to provide for curing and a durometer between 50 and 75 on the Shore A Scale. Neoprene and Hypalon are selected as the best fire-retardant elastomer of the common types used for expansion joints. This material shall be certified flame resistant as outlined in 10.3.

5.4 Integral Flanges—The tube, fabric plies, and cover shall be brought up from the joint body to form an integral flange. This rubber flange shall extend beyond the bolt holes of the retaining ring.

5.5 Floating Metallic Flanges—The metal flanges shall have a groove to accept the molded bead in the body at each end of the expansion joint bellows.

5.6 Arches—Arches may be either straight sided or long radius depending on the manufacturer’s standard construction. The arch size and shape determine the movement capability of the joint. Minimum movement capability of single arch joints shall be in accordance with the Technical Handbook table titled “Expansion Joint Movement Force/Spring Rate Capability.” Movement capability information for multiple arch joints shall be available from the manufacturer.

5.7 Metallic Flanges:

5.7.1 Flanges shall be drilled in accordance with the Technical Handbook appendix titled “Common Flange Dimension/Drilling Chart” or in accordance with the customer order as required, to match the mating flanges.

5.7.2 Metallic flanges shall meet the material requirements and pressure-temperature ratings in accordance with ANSI B16.1, B16.5, or B16.24.

5.8 Retaining Rings—Retaining rings for the integral flange type are installed behind the flanges and are drilled to match the flange drilling. The sections supplied for each flange should be split at the bolt holes to ensure a proper seal at all points when the bolts are tightened. The edge next to the rubber flange shall be broken or bevelled to prevent cutting the rubber flanges. Retaining rings must be a minimum thickness of \( \frac{3}{8} \) in. (9.5 mm) and shall be made of steel or ductile iron. Carbon steel shall be in accordance with Specification A 395.

6. Other Requirements

6.1 All expansion joints shall be designed for a minimum burst pressure of four times the maximum allowable working pressure. The design shall be based on analytical or experimental test of expansion joints of similar construction, class, type, and size. The design shall be certified by tests if ordered (see 4.1.9).

6.2 Performance Requirements—Single arch expansion joint movement shall not exceed the limits of the Technical Handbook table referred to in 5.6 unless the manufacturer certifies that a proposed design can exceed the listed minimum movement capability to meet a special requirement greater than the minimum listed. Multiple arch-joint movement shall be of the manufacturer’s certified design.

6.3 Pressure Rating—Expansion joints shall be limited to the pressures listed in the table “Pressure Characteristics of Rubber Expansion Joints” of the Technical Handbook.

7. Dimensions and Permissible Variations

7.1 Expansion joints shall be dimensioned in accordance with the Technical Handbook table titled “Expansion Joint Movement/Force/Spring Rate Capability.”

8. Workmanship, Finish, and Appearance

8.1 Tube—The tube shall be free from cuts and breaks or severe abrasions. Small depressions and indentations are acceptable as long as the surface of the elastomer is not broken.

8.2 Integral Rubber and Fabric Flange:

8.2.1 The face of an integral rubber and fabric flange shall be free of cuts or obvious breaks and shall be covered with rubber. The most critical portion of the flange is from the inside diameter of the joint out to the bolt holes.

8.2.2 Bolt holes shall be drilled cleanly through the rubber flange. The retaining rings shall be checked for proper alignment with bolt holes.

8.2.3 The outer edge of the flange shall be sealed with rubber, so that moisture from the atmosphere cannot attack the reinforcing fabrics.

8.2.4 The surface of the rubber flange against which the retaining rings are installed shall be covered with rubber. The surface may be irregular and building form tooling marks are not objectionable.

8.3 Expansion Joint Cover and Body—The cover of a joint does not contribute to the strength of the joint. Its purpose is to keep fluids from the atmosphere or surroundings from being absorbed into the body plies of fabric. Surface blemishes, such as flash, nylon wrap markings, grooves, and other indentations...
in the cover, over the arch, or in the body area, are not harmful as long as the body fabric is not exposed.

9. Number and Type of Tests

9.1 Prototype Test:

9.1.1 When required by the purchaser, an expansion joint of each size and type shall be burst tested to determine its maximum allowable working pressure (see 10.1).

9.1.2 The outer covering material of the expansion joint shall be tested to determine its self-extinguishing characteristics (see 10.3).

9.2 Production Test—When required by the purchaser, an expansion joint shall be hydrostatically tested to 1.5 times its maximum allowable working pressure at its rated maximum operating temperature (see 10.2).

10. Test Methods

10.1 Burst Test—Fill each joint to be tested with water before the application of pressure, allowing all air in the joint to escape. Apply pressure at a uniform rate until failure of the joint occurs. Consider the pressure at which any fluid leakage first occurs as the bursting pressure of the joint. The maximum allowable working pressure of the joint shall be less than or equal to \( \frac{1}{4} \) the bursting pressure determined by this test.

10.2 Hydrostatic Test—Fill each joint to be tested with water before the application of pressure, allowing all air in the joint to escape. Apply pressure at a uniform rate up to the test pressure. The joint shall show no sign of leakage at the test pressure.

10.3 Flame Resistance Test—Test four specimens of the joint, \( \frac{1}{2} \) by 6 in. (12.7 by 152.4 mm) by the thickness of the expansion joint, in accordance with 30 CFR 18.65(b) through (d). Consider the expansion joint flame resistant if the tests of the four specimens meet the test requirements in 30 CFR 18.65(e).

11. Inspection

11.1 Inspection of the material shall be agreed upon between the purchaser and the supplier as part of the purchase contract.

12. Certification

12.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser stating that samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

12.2 When specified in the purchase order or contract, a certified drawing detailing the expansion joint shall be provided.

13. Product Marking

13.1 Each expansion joint shall be permanently marked or tagged with the following information:

13.1.1 Manufacturer’s name or trademark.

13.1.2 Nominal diameter.

13.1.3 Manufactured date (month and year).

13.1.4 Maximum allowable working pressure and temperature (psi/°F (Pa/°C)).

13.1.5 Face-to-face dimension.

13.1.6 ASTM designation and year of issue of this specification.

14. Quality Assurance

14.1 The manufacturer of the expansion joint shall maintain the quality of the joints that are designed, tested, and marked in accordance with this specification. At no time shall a joint be sold with this specification designation that does not meet the requirements herein.

15. Keywords

15.1 arch-type non-metallic expansion joints; expansion joints
1. Scope

1.1 This practice describes a standard procedure for inspecting the coating system of a ship’s topside and superstructure, tanks and voids, decks and deck machinery, and underwater hull and boottop during drydocking. Included are a standard inspection form to be used for reporting the inspection data, a diagram that divides topside and superstructure individual inspection areas, and a series of diagrams that are used to report the extent of damage to the coating system.

1.2 This practice is intended for use only by an experienced marine coating inspector.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
D 660 Test Method for Evaluating Degree of Checking of Exterior Paints
D 714 Method for Evaluating Degree of Blistering of Paints
D 772 Test Method for Evaluating Degree of Flaking (Scaling) of Exterior Paints

2.2 Steel Structures Painting Council:
SSPC-PA-2 Measurement of Dry Paint Thickness With Magnetic Gages

3. Significance and Use

3.1 This practice establishes the procedure for the inspection of coating systems on board ships. It contains a series of diagrams to be used to report the extent of damage to coatings.

4. Reference Standards

4.1 Extent of Failure—The overall extent of failure diagrams (see Fig. 1) and the extent within affected area diagrams (see Fig. 2 and Fig. 3) are used to report the area covered by various fouling organisms, different types of corrosion, and paint failures. The overall extent of failure diagrams are used first to group all areas where a particular type of damage has occurred into one contiguous block. The extent within affected area diagrams are then used to identify the pattern of damage within that contiguous block. (For example, inspection for Section I.A.—General Corrosion (see Figs. 4-7) and general corrosion appears distributed over the entire inspection area as shown by the black areas in Fig. 8.)

4.1.1 The first step is to draw an imaginary line that would enclose all of the general corrosion. This enclosure should be as small as possible. Select the diagram from the overall extent of failure diagrams that most closely approximates the enclosed area with respect to the entire inspection area. Using the general corrosion example, the enclosed area (shaded area) would closely match Fig. 9.

4.1.2 Enter a “6” (for Diagram 6 in Fig. 1) in the box next to I.A.1. overall extent of failures in Fig. 4.

4.1.3 The second step is to look at only the enclosed area and select the diagram from the extent within affected-area diagrams that most closely identifies the pattern of general corrosion in the enclosed area. In this example, Fig. 10 (Diagram N) would be a good choice.

4.1.4 Enter an “N” (for Diagram N in Fig. 3) in the box next to I.A.1.A. extent within the affected area.

Note 1—Selection of diagrams is based on visual comparisons, and therefore, different inspectors may select different diagrams. The diagrams are designed to minimize these differences and enhance reproducibility.

4.2 Forms of Mechanical Damage—This reference standard (Fig. 11) is a series of photographs used to identify the various forms of mechanical damage to a coating that can lead to corrosion.

4.3 Types of Corrosion—This reference standard (Fig. 12) is a series of photographs used to show examples of general coating damage. Included could be general corrosion, pitting corrosion, pin-point corrosion, galvanic corrosion/coating undercutting, cavitation corrosion, corrosion along welds, and rust staining.

---

2 Available from ASTM Annual Book of ASTM Standards, Vol 06.01.

3 Available from Steel Structures Painting Council, 40 24th St., Pittsburgh, PA 15222-4656.
4.4 Levels of Delamination—This reference standard (Fig. 13) is a series of diagrams that identifies the levels in a coating system where delamination can occur.

5. Requirements for Inspectors

5.1 The inspector must be able to perform the following tasks:
5.1.1 Calibrate and use a magnetic gage to measure dry film thickness (DFT).
5.1.2 Use pH paper or pH meter properly.
5.1.3 Use a camera properly.
5.1.4 Recognize the various types of corrosion and forms of paint failures (blistering, delamination, etc.).
5.1.5 Recognize the various ship areas as described in Figs. 14-16.

6. Procedure

6.1 The inspection form consists of two pages to be completed by the inspector and four pages of reference standards. Complete the first of the two pages as shown in Fig. 17. This form, which is self-explanatory, requests general information about the ship.

6.2 The second page of the applicable inspection form to be completed by the inspector is shown in Figs. 4-7. Complete a separate inspection form for each of the inspection areas delineated in Figs. 14-16. Instructions for completing the form (shown in Figs. 4-7) are given in Section 7.

6.2.1 For the ship’s topside and superstructure, divide the inspection area into six sections. These six inspection areas are defined by the diagram in Fig. 14. For each complete inspection, complete one form, shown in Fig. 4, for each section.

6.2.2 For the ship’s tanks and voids, divide the inspection area into seven sections. These seven inspection areas are defined by the diagram in Fig. 15. For each complete tank inspection, complete one form, shown in Fig. 5, for each section.

6.2.3 For the ship’s underwater hull and boottop, divide the inspection area into twelve inspection areas. These twelve inspection areas are defined by the diagram in Fig. 16. For each complete underwater hull inspection, complete one form, shown in Fig. 6, for each section.

6.2.4 For the ship’s deck and machinery, the inspection area is a code which is used to designate an area of the ship’s deck.
or a piece of deck machinery. The purpose of the code is to identify positively the area being inspected so that a history of inspection data can be gathered. For sections of the ship other than decks and deck machinery (that is, underwater hull, boottop, topside, superstructure, tanks, and voids), it is possible to develop a general diagram with logical inspection areas and inspection area codes. Decks and deck machinery vary so greatly between ship types that the development of a general diagram with logical inspection areas and inspection area codes is not feasible. It should be the responsibility of the organization that authorizes the inspections to develop the ship diagram, logical inspection areas, and inspection area codes and to make certain that this same coding system is used during all subsequent inspections.

7. Form Instructions

7.1 Inspection Area—The topside/superstructure is divided into six inspection areas (see Fig. 14). Enter the code for the area being inspected. (For example, enter “SA” for the superstructure aft; “SM” for the superstructure midships; “SF” for the superstructure forward; “SO” for other superstructure, that is, bulwarks, vents, sideport openings, etc.; “HS” for hull starboard; and “HP” for hull port.)

7.1.1 A tank is segmented into seven inspection areas (see Fig. 15. Enter the code for the area being inspected. (For example, enter “B” for the bottom of tank inspection, “A” for the aft bulkhead, etc.) A complete list of tank segments and their codes is shown in Fig. 15.

7.1.2 The underwater hull and boottop are segmented into twelve distinct inspection areas. Enter the code for the area being inspected. (For example, enter “P1” for the port bow inspection, “S1” for the starboard bow inspection, etc.) A complete list of hull segments and their codes is shown in Fig. 16.

7.1.3 Decks and deck machinery vary so greatly between ship types that the development of a general diagram with logical inspection areas and inspection area codes is not feasible. It should be the responsibility of the organization that authorizes the inspections to develop the ship diagram, logical inspection areas, and inspection area codes and to make certain that this same coding system is used during all subsequent inspections.

7.2 Date—Enter the date of the inspection. If the inspection requires more than one day, enter the date the inspection is completed.

7.3 Ship Name—Enter the ship’s name (for example, LPH-14, USS Trenton).

7.4 Hull Number—Enter the builder’s hull number of the ship (for example, Nassco No. 1182).

7.5 Inspector’s Name—The inspector should print his name.

7.6 Tank Number—Enter tank designation.

7.7 Tank Type—Enter type (for example, fuel oil, ballast, etc.).

7.8 Required Photographs—For each inspection area, a photograph of the entire area is required. If the area is too large to capture in one photograph, the area should be divided into equal-sized segments and each segment should be photographed. An individual close-up photograph of each damaged section in the inspection area is required. Each photograph should be marked with the area number, ship name, and date. Also a size scale should be captured in each photograph. This size scale is a reference standard that would be used to determine the approximate size of the photographed ship area. (For example, a 12-in. (304.8-mm) rule might be an appropriate size scale for a relatively small ship area.)

7.9 Inspection Area Obscured—If the inspection area is completely obscured and cannot be inspected, circle the “Y.” This condition of being completely obscured will probably occur most frequently in the bottom inspection area (“B”) where dirt and other contaminants have settled. If the inspection area is not completely obscured, circle the “N.”

8. Classification of Corrosion

8.1 The inspector should distinguish between six types of corrosion and report each type separately. The six types of corrosion are as follows:

8.1.1 General Corrosion—General corrosion, for the purposes of this inspection form, is all corrosion that is not covered in the mechanical damage, pitting corrosion, pinpoint
corrosion, galvanic corrosion/coating undercutting, or rust staining in 8.1.2, 8.1.3, 8.1.4, 8.1.5, and 8.1.6. Patches of common, ordinary rusting are classified as general corrosion.

8.1.2 Mechanical Damage—Mechanical damage corrosion is corrosion that occurred because the paint was removed from the hull by some type of scraping or impact against the hull. With the paint removed and the steel hull exposed to sea water, corrosion occurred. Photographic examples of corrosion caused by various forms of mechanical damage (that is, scraping/impact, anchor chains/ropes, and internal welds/burning) are shown in Fig. 8.

8.1.3 Pitting Corrosion—Pitting corrosion is a more advanced form of localized corrosion. Pitting corrosion is characterized by visible indentations or pits that have penetrated
into the steel hull surface. These pits distinguish between pitting corrosion and general corrosion, the latter being characterized by a layer of rust that does not penetrate locally into

FIG. 6 Underwater Hull and Boottop
the surface but is more uniform in extent. A photographic example of pitting corrosion is shown in Fig. 12.

8.1.4 Pin-Point Corrosion—Pin-point corrosion is characterized by a pattern of small spots (pin-points) of rust. A photographic example of pin-point corrosion is shown in Fig. 12.

8.1.5 Galvanic Corrosion/Coating Undercutting—Galvanic corrosion is characterized by the rapid deterioration of one metal at or near a bimetallic joint. Galvanic corrosion some
times results in coating removal or undercutting. A photographic example is shown in Fig. 12.

8.1.6 Rust Staining—Rust staining occurs on top of the coating with no penetration to the substrate. A photographic example is shown in Fig. 12.

9. Examination of Fouling (Underwater Hull and Boottop)

9.1 Slime:

9.1.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of slime fouling. If there is no slime fouling in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

9.1.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of slime fouling within the affected area. If the overall extent of failure box as specified in 9.1.1 is marked with a “0” (zero), leave the extent within affected area box blank.

9.2 Grass:

9.2.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of grass fouling. If there is no grass fouling in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

9.2.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of grass fouling within the affected area. If the overall extent of failure box as specified in 9.2.1 is marked with a “0” (zero), leave the extent within affected area box blank.

9.3 Barnacles:
9.3.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of barnacle fouling. If there is no barnacle fouling in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

9.3.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of barnacle fouling within the affected area. If the overall extent of failure box as specified in 9.3.1 is marked with a “0” (zero), leave the extent within affected area box blank.

9.4 Tubeworms:
9.4.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of tubeworm fouling. If there is no tubeworm fouling in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

9.4.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of tubeworm fouling within the affected area. If the overall extent of failure box as specified in 9.4.1 is marked with a “0” (zero), leave the extent within affected area box blank.

9.5 Other:
9.5.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instruction for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of fouling other than slime, grass, barnacles, or tubeworm fouling. If there is no fouling other than slime, grass, barnacles, or tubeworms in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.
on Fig. 6. If the metal substrate is relatively smooth and free of indentations and pit corrosion, circle the “N.”

10. Examination of Corrosion

10.1 General:

10.1.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of general corrosion. If there is no general corrosion in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

10.1.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of general corrosion within the affected area. If the overall extent of failure box as specified in 10.1.1 is marked with a “0” (zero), leave the extent within affected area box blank.

10.2 Mechanical Damage:

10.2.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of corrosion caused by mechanical damage. If there is no corrosion caused by mechanical damage in this inspection area, enter the number “0” (zero) and leave the next box (extent within affected area) blank.

10.2.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of corrosion as a result of mechanical damage within the affected area. If the overall extent of failure box as specified in 10.2.1 is marked with a “0” (zero), leave the extent within affected area box blank.

10.2.3 Type of Damage—If corrosion caused by mechanical damage has occurred, use the photographic examples in Fig. 11 to identify the type of mechanical damage that has occurred. On the inspection form, mark an “X” in the box next to the type of damage (that is, scraping/impact, internal welds/burning, anchor chains/ropes/cables) that has occurred.

10.3 Pitting Corrosion:

10.3.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of pitting corrosion. If there is no pitting corrosion in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

10.3.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of pitting corrosion within the affected area. If the overall extent of failure box as specified in 10.3.1 is marked with a “0” (zero), leave the extent within affected area box blank.

10.4 Pin-Point Corrosion:

10.4.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1),
enter the number of the diagram that most closely approximates the overall extent of pin-point corrosion. If there is no pin-point corrosion in this inspection area, enter the number “0” (zero), and leave the next box (extent within affected area) blank.

10.4.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of pin-point corrosion within the affected area. If the overall extent of failure box above is marked with a “0” (zero), leave the extent within affected area box blank.

10.5 Galvanic Corrosion/Coating Undercutting—Galvanic corrosion/coating undercutting occurs most frequently in situations in which dissimilar metals are joined (that is, near posts, mounts, bolts, and especially when an aluminum superstructure is mounted on a steel hull). Galvanic corrosion/coating undercutting is characterized by corrosion that may begin beneath undamaged coating. The corrosion undercutts and lifts the coating as it progresses. If galvanic corrosion/coating undercutting is present, the inspector should circle the “Y.” Otherwise the “N” should be circled.

10.6 Rust Staining—Rust staining is a brownish, rust-colored discoloration that occurs when loose rust particles are carried by water across a painted surface and are absorbed into the paint giving a brownish stain. It is important to distinguish between rust staining that is simply a discoloration and corrosion that is a paint failure. If rust staining has occurred in the inspection area, circle the “Y.” If no rust staining has occurred, circle the “N.”

10.7 Corrosion Along Welds—Corrosion is prevalent along the welds in tanks and voids. Check all welds and circle “Y” if any weld or any area immediately adjacent to a weld is corroded. If all welds and adjacent areas are free of corrosion, circle the “N.”

10.8 Cavitation (P5, S5, A Only)—If you are not inspecting the P5 (port stern), S5 (starboard stern), or A (appendages—struts, rudder, etc.) inspection area, disregard this section. If you are inspecting the P5, S5, or A area, use the photographic example in Fig. 12 to determine if cavitation has occurred. If cavitation has occurred circle the “Y” next to P5, S5, A only. If cavitation has not occurred, circle the “N.”

PAINT CONDITION

11. Examination of Paint Conditions

11.1 Delamination—Delamination is characterized by detachment of the coating from the substrate or by a layer separation between the coats of paint.

11.1.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of delamination. If there is no delamination in this inspection area, enter the number “0” and proceed to 11.2.

11.1.2 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of delamination within the affected area. If the
overall extent of failure box as specified in 11.1.1 is marked with a "0" (zero), leave the extent within affected area box blank.

11.1.3 Topcoat—Mark an “X” in the box beside topcoat if topcoat delamination has occurred. Topcoat delamination has occurred if only the outermost coating has separated from all undercoats. A diagram of topcoat delamination is shown in Fig. 13.

11.1.4 Within Repair System—Mark an “X” in the box beside within repair system if delamination has occurred between layers of the repair system excluding delamination between the topcoat and the outermost undercoat. (This is topcoat delamination.) The repair system is defined as any coating system that is applied on top of the original coating system. If the original coating system has not been overcoated, delamination within the repair system is not possible. A diagram of delamination within the repair system is shown in Fig. 13.

11.1.5 Between Original/Repair—Mark an “X” in the box beside between original/repair if delamination has occurred between the outermost coat of the original coating system and the innermost coat of the repair system. A diagram of delamination between original/repair is shown in Fig. 13.

11.1.6 Within Original System—Mark an “X” in the box beside within original system if delamination has occurred between any layers of the original coating system.

11.1.7 To Primer Coat—Mark an “X” in the box beside to primer coat if delamination has occurred between the innermost coat of the original coating system and the shop primer. A diagram of delamination to primer coat is shown in Fig. 13.

11.1.8 To Steel Substrate—Mark an “X” in the box beside to steel substrate if all coatings have separated from the surface of the hull leaving the bare steel exposed. A diagram of delamination to steel substrate is shown in Fig. 13.

11.1.9 Organic Odor from Delamination Area—The inspector should determine if there is an organic odor emanating from the delaminated area. If there is an odor from an organic solvent (such as MEK or hi-flash naphtha), circle the “Y.” If there is no organic odor, circle the “N.”

11.1.10 Sample Taken—If samples are taken, circle the “Y” ; if not, circle the “N.” Samples may be taken by removing some of the delaminated paint chips and placing them into a small container. The container should be labelled with the area number, ship name and hull number, date, and inspector’s name.

11.2 Blistering:

11.2.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1) and Method D 714, enter the number of the diagram that most closely approximates the overall extent of blistering. If there is no blistering in this inspection area, enter the number “0” (zero), and proceed to 11.3.

11.2.2 Size—Using the method in accordance with Method D 714, enter the number that most closely approximates the size of the largest blister in the inspection area.

11.2.3 Density—Using the method in accordance with Method D 714, enter the number that most closely approximates the highest blister density in the inspection area.

11.2.4 Broken Blisters, Percent—Visually approximate the percentage of broken blisters and enter that number in the box to the right. If none of the blisters are broken, enter the number “0.” To complete 11.2.5, 11.2.6, and 11.2.7 of the inspection, the inspector must break open a few of the blisters using a knife or other sharp object.

11.2.5 Organic Odor in Blisters—When the blisters are broken, the inspector should note whether the blisters contain liquid. If the blisters do contain liquid, the inspector should smell the liquid to determine if the liquid has an organic odor (that is, ketone). If the liquid does have an organic odor, circle the “Y” next to organic odor in blisters. If there is no organic odor, or if the blisters do not contain liquid, circle the “N.”

11.2.6 Blisters Contain Water—If the blisters contain liquid and the liquid does not have an organic odor, circle the “Y” next to blisters contain water. If none of the blisters contain liquid, circle the “N.”

11.2.6.1 pH—If “Y” is circled in response to blisters contain water, then determine the pH of the water using pH paper or pH meter and enter the pH value in the box to the right of pH.

11.2.7 Corrosion Under Blisters—Look at the substrate beneath the blisters that have just been broken open. If any part of the substrate beneath these blisters is corroded, circle the “Y” next to corrosion under broken blisters. If none of the substrate beneath these broken blisters is corroded, circle the “N.”

11.3 Checking:

11.3.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of cracking. If there is no cracking in this inspection area, enter the number “0” (zero), and proceed to 11.4.

11.3.1.1 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of cracking within the affected area. If the overall extent box above is marked with a “0” (zero), leave the extent within affected area box blank.

11.4 Checking:

11.4.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1) and Test Method D 660, enter the number of the diagram that most closely approximates the overall extent of checking. If there is no checking in this inspection area, enter the number “0” (zero), and proceed to 11.5.

11.4.1.1 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1), enter the letter of the diagram that most closely approximates the extent of checking within the affected area. If
11.5 Flaking:

11.5.1 Overall Extent of Failure—Using the overall extent of failure diagrams (diagrams and instructions for use in 4.1), enter the number of the diagram that most closely approximates the overall extent of flaking. If there is no flaking in this inspection area, enter the number “0” (zero), and proceed to 11.6.

11.5.1.1 Extent Within Affected Area—Using the extent within affected area diagrams (diagrams and instructions for use in 4.1) and Test Method D 772, enter the letter of the diagram that most closely approximates the extent of flaking within the affected area. If the overall extent of failure box as specified in 11.5.1 is marked with a “0” (zero), leave the extent within affected area box blank.

11.5.2 Severity—Use the photographic reference standard in accordance with Test Method D 772 to determine the degree of flaking. Enter the number of the photographic reference standard (2, 4, 6, or 8) that most closely approximates the degree of flaking on the inspection surface.

11.6 Sags or Curtains—Sags or curtains can occur on a vertical surface when paint is applied too thickly. Gravity will cause the paint to move down the vertical surface to form either a continuous ridge across the surface (curtain) or a running stream down the surface (sag). If either sags or curtains have occurred, circle the “Y.” If there is no evidence of sags or curtains, circle the “N.”

11.7 Chalking—Chalking is characterized by the presence of loose removable powder, evolved from the paint film itself, at or just beneath the surface. Chalking may be detected by rubbing the fingertips across the film. If chalking is present, circle the “Y.” If there is no evidence of chalking, circle the “N.”

11.8 Presence of Oil/Grease/Smoke—The inspector should examine the inspection area for the presence of oil or grease marks (usually the result of spills) and for smoke stains (usually the result of smoke from exhaust stacks). If oil or grease marks or smoke stains are present in the inspection area, the inspector should circle “Y”; otherwise, the “N” should be circled.

11.9 Bleeding—Bleeding is said to occur when the color of an undercoat (usually a darker color) extends or bleeds through the surface of a topcoat (usually a lighter color). If bleeding has occurred in the inspection area, the inspector should circle the “Y.” If there is no evidence of bleeding, the “N” should be circled.

11.10 Fading—Fading is defined as the loss of brightness or vividness of color. Fading is usually more apparent with darker colors. If fading has occurred in the inspection area, the inspector should circle the “Y,” otherwise, the “N” should be circled.

11.11 Knife Test—Using a craftsman’s knife with a curved blade and holding the blade at a 30° angle to the substrate, cut a narrow ribbon of coating from an undamaged portion of the inspection area.

11.12 Erosion—Erosion is the wearing away of a paint film over a period of time to expose the substrate or undercoat. If erosion has occurred in the inspection area, circle the “Y.” If there is no evidence of erosion, circle the “N.”

11.13 Discoloration—Discoloration is characterized by a brown or black stain in the paint film that occurred because the tank was carrying fuel. Usually, there will be a line across the vertical surfaces of the tank below which discoloration has occurred and above which there is no discoloration. This line would be left by the level in the tank. If discoloration is present, circle the “Y.” If there is no discoloration, circle the “N.”

11.14 Softening—Softening can be the result of organic fuel cargo. Softening can be detected by pressing the edge of your fingernail into the paint film. If an impression is made, circle “Y.” If your fingernail does not penetrate the surface, softening has not occurred and the “N” should be circled.

11.15 Valves, Piping, and Heating Coils Present—If valves, piping, or heating coils are attached to or supported from the inspection area surface, circle “Y.” If no valves, piping, or heating coils are attached to or supported from the inspection area surface, circle “N” and proceed to 11.16.

11.15.1 Coating Damage in Adjacent Areas—If valves, piping, or heating coils are present, the inspector should examine the adjacent painted areas. If any damage (that is, delamination, blistering, corrosion, etc.) to the paint system has occurred, circle the “Y.” If there is no damage to the paint, circle the “N.”

11.16 Stiffeners Present—Horizontal and vertical stiffeners are structural supports that may be present in the tank to add strength and rigidity. If stiffeners are attached to the inspection area surface, circle the “Y.” If stiffeners are not present, circle the “N” and proceed to 11.17.

11.16.1 Coating Damage Behind Stiffeners—If stiffeners are present, the inspector should examine the adjacent painted area. If any damage (that is, delamination, blistering, corrosion, etc.) to the paint system has occurred, circle the “Y.” If there is no damage to the paint, circle the “N.”

11.17 Anodes Present—If the anodes are attached to the inspection area surface, circle the “Y.” If there are no anodes attached to the inspection area surface, circle the “N” and proceed to 11.18.

11.17.1 Coating Damage in Adjacent Areas—If anodes are present, the inspector should examine the adjacent painted area. If any damage (that is, delamination, blistering, corrosion, etc.) to the paint system has occurred, circle the “Y.” If there is no damage to the paint, circle the “N.”

11.17.2 Anodes Functioning—There are two situations when the anodes can be said to be functioning: (1) if the anode itself is corroded and has lost mass and shape, and (2) if both the anode itself and all surfaces in the tank are completely free of corrosion. If either of these situations exists, circle the “Y.” The anode is not functioning if corrosion is present on the tank surfaces but the anode itself is free of corrosion. In this latter situation, circle the “N.”

Note 3—Do not confuse superficial dirt on the anode with corrosion.

11.18 Excessive Wear/Mechanical Damage—The inspector should examine the inspection area for signs of excessive wear.
or mechanical damage. Excessive wear is characterized by a wear path through a coated area caused by heavy foot or vehicular traffic over the same path. Mechanical damage is characterized by scrapes or cuts through a coated area caused by dropping tools, dragging heavy equipment, etc.

11.18.1 Non-skid Areas—If excessive wear or mechanical damage has occurred on a non-skid surface in the inspection area, the inspector should circle the “Y;” otherwise, the “N” should be circled.

11.18.2 Other Areas—If excessive wear or mechanical damage has occurred on any surface that is not a non-skid surface, the inspector should circle the “Y;” otherwise, the “N” should be circled.

12. Acceptability

12.1 If the cut portion of the coating ribbons or delaminates between layers, circle the “Y.” If there is no evidence of ribboning or delamination between layers, circle the “N.” If “Y” is circled, identify the delamination layer by marking the appropriate delamination box (IIA, 2 to 7) in Fig. 4, Fig. 5, and Fig. 7 and IIIA, 2 to 7 in Fig. 6.

12.1.1 Topcoat—Mark an “X” in the box beside topcoat if topcoat delamination has occurred. Topcoat delamination has occurred if only the outermost coating has separated from all undercoats. A diagram of topcoat delamination is shown in Fig. 13.

12.1.2 Within Repair System—Mark an “X” in the box beside within repair system if delamination has occurred between layers of the repair system excluding delamination between the topcoat and the undercoat. (This is topcoat delamination.) The repair system is defined as any coating system that is applied on top of the original coating system. Therefore, if the original coating system has not been overcoated, delamination within the repair system is not possible. A diagram of delamination within the repair system is shown in Fig. 13.

12.1.3 Between Original/Repair—Mark an “X” in the box beside between original/repair if delamination has occurred between the outermost coat of the original coating system and the innermost coat of the repair system. A diagram of delamination between original/repair is shown in Fig. 13.

12.1.4 Within Original System—Mark an “X” in the box beside within original system if delamination has occurred between any layers of the original coating system. A diagram of delamination within original system is shown in Fig. 13.

12.1.5 To Primer Coat—Mark an “X” in the box beside to primer coat if delamination has occurred between the innermost coat of the original coating system and the primer coat. A diagram of delamination to primer coat is shown in Fig. 13.

12.1.6 To Steel Substrate—Mark an “X” in the box beside the steel substrate if all coatings have separated from the surface of the hull leaving bare steel exposed. A diagram of delamination to steel substrate is shown in Fig. 13.

13. Measured Properties

13.1 Dry Film Thickness—Make dry film thickness (DFT) measurements using a properly calibrated magnetic gage. Perform measurements and calibration in accordance with SSPC-PA-2. Record each measurement to include three individual measurements within each spot measurement. The separate spots where DFT measurements are taken must be clean and dry with an intact coating undamaged by fouling, corrosion, etc. If a separate spot is not suitable for DFT measurements, proceed to the nearest suitable location. If the entire inspection area is not suitable for DFT measurements leave all boxes blank.

13.1.1 Each line on the inspection form is intended to hold all of the readings to include three individual readings within a spot reading.

13.2 There are enough lines present on the inspection forms to hold readings for A: (1) 6000-ft² underwater hull inspection area, (2) 1800-ft² topside and superstructure inspection area, and (3) 1000-ft² tanks and voids inspection area.

13.3 If the inspection area is larger than that specified in the applicable area in 13.2, circle the “Y” next to Number 1, take more DFT readings. On a separate sheet of paper, enter all of the additional readings. Also include the area number (of the inspection area), date, ship name, hull number, and inspector’s name. If the inspection area is not larger than that specified in the applicable area in 13.2, circle the “N” next to Number 1.

13.4 Dielectric Shields—For underwater hull, the inspector should inspect both the primary and secondary dielectric shields and answer yes (“Y”) or no (“N”) to questions A to D, F, and G. Measure the dry film thickness (DFT) of both the primary and secondary dielectric shields and record the results in the boxes next to E, Film Thickness (mils). If only one dielectric shield is present, record answers under primary (PRIM). Leave the columns under secondary (SEC) blank.

13.4.1 Blistering—If blistering is present, circle “Y.” If there are no blisters, circle “N.”

13.4.2 Delamination—If delamination is present, circle “Y.” If there is no delamination, circle “N.”

13.4.3 Fouling—If any type of fouling is present, circle “Y.” If the dielectric shield is free of fouling, circle “N.”

13.4.4 Corrosion:

13.4.4.1 General—If general corrosion is present, circle “Y;” otherwise, circle “N.”

13.4.4.2 Pitting—If pitting corrosion is present, circle “Y;” otherwise, circle “N.”

13.4.5 Dry Film Thickness—Enter the DFT measurements in the appropriate box.

13.4.6 Calcareous Deposit—If any calcareous (white, calcium-like) deposits are present, circle “Y.” If none are present, circle “N.”

13.4.7 Erosion—If there is evidence of erosion, circle “Y.” If no evidence of erosion is present, circle “N.”

14. Recommendations

14.1 Any recommendations deemed by the inspector to apply to the conditions observed or reported on the form should be entered here. If the inspector has no recommendations, state “none” in the section.

14.2 The last line on the form provides the documentation whether an officer received a copy of the inspection form. The officer’s signature following “Acknowledged by” indicates the ship’s representative did receive a copy of the inspection results. It is not meant to indicate his agreement or disagreement of the information on the form.
15. Keywords

15.1 coating system; inspection; ships

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Specification for
Insulation Resistance Monitor for Shipboard Electrical
Motors and Generators

This standard is issued under the fixed designation F 1134; the number immediately following the designation indicates the year of
original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A
superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope
1.1 This specification covers monitoring devices (monitors) for the automatic detection and signaling of low insulation
resistance values in idle electrical motors or generators, or both.
1.2 Monitors are intended for permanent installation in both existing or new panels and controller enclosures designed for
marine application.
1.3 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information
only.
1.4 The following safety hazards caveat pertains only to the test method described in this specification: This standard does
not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this
standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior
to use.

2. Referenced Documents
2.1 UL Standard:
UL 94 Test for Flammability of Plastic Materials for Parts in Devices and Appliances
2.2 IEEE Standards:
IEEE 45 Recommended Practice for Electrical Installations on Shipboard
IEEE 100 Standard Dictionary of Electrical and Electronics Terms
2.3 Government Standard:
Title 46 Code of Federal Regulations Shipping

3. Terminology
3.1 Definitions—In general, definitions shall be in accordance with IEEE 100.
3.2 Definitions of Terms Specific to This Standard:
3.2.1 idle machine—rotary machine, when not rotating, owing to the absence of energy.
3.2.2 monitor—device, generally located in a motor starter, control panel, or main switchboard, that senses the leakage
resistance of electrical machine windings to ground, while the monitored machine stands idle.

4. Monitor Classification
4.1 Type—The insulation resistance monitors covered by this specification shall be of the following types:
4.1.1 Type I—Alternating current motor monitors.
4.1.2 Type II—Alternating current generator monitors.
4.1.3 Type III—Direct current motor monitors.
4.1.4 Type IV—Direct current generator monitors.
4.2 Duty Rating—All monitors shall be capable of continuous duty operations as defined in accordance with IEEE 100.

5. Ordering Information
5.1 Monitoring devices shall be ordered by including the following information:
5.1.1 Purpose or Use of Monitor(s)—Application as motor or generator monitor.
5.1.2 Line voltage and frequency.
5.1.3 Control voltage and frequency.
5.1.4 Type of starter (if motor monitor).
5.1.5 Winding configuration (if motor monitor).
5.1.6 Location of monitor.
5.1.7 Sensitivity—Set for 1 megohm (optional setting, if requested, from 0.1 to 5 MΩ).
5.1.8 Remote monitoring devices.
5.1.9 Special options requested (that is, test buttons, elevated ambient temperature usage, and so forth.).

6. Materials and Manufacture
6.1 General—Materials used in the construction of insulation resistance monitors are to be manufactured and tested in
accordance with IEEE 45. Materials conforming to other
recognized standards will be subject to approval by the
procuring agency, provided they are not less effective.
6.2 Flame-Retardant Materials—Enclosure materials used
in the construction of the monitors are to be flame-retardant in
accordance with UL94, and have a minimum flame rating of
94V-1 for monitors being installed within a motor controller
enclosure, or switchgear-type enclosure, or a minimum rating
of 94-SV for monitors not installed within such an enclosure.
6.3 Electrical Insulation—Electrical insulation materials
used and application thereof shall be in accordance with the
requirements of IEEE 45.
6.4 Current Carrying Terminals—All monitor current car-
yring terminals shall be made of corrosion resistant material in
accordance with CFR 46, Subchapter J.
6.5 Electrical Isolation—Monitors shall isolate their meas-
uring circuit from the line voltage, while the motor is
operating, by the use of an integral isolating relay.

7. General Design Requirements
7.1 Environment:
7.1.1 Temperature—The rating of the monitor shall be
based on an ambient temperature of 50°C (122°F).
7.1.1.1 Operating Temperature Range—Monitors shall op-
erate over the range from 0 to 50°C (32 to 122°F). (See 10.1.2
for operation range.)
7.1.2 Sealing—The monitor housing upon final assembly
shall protect the internal components against foreign matter
and shall be so constructed as to prevent tampering.
7.1.3 Inclination—Monitors shall operate when inclined at
any angle up to 60° in any direction from the normal operating
position.
7.1.4 Humidity—Monitors shall operate at a constant rela-
tive humidity of up to minimum 90 %.
7.1.5 Vibration—Monitors shall operate in the presence of
acceptable operational shipboard vibration, without mechani-
cal damage, control chatter, or other defects.
7.2 Operating Voltage/Accuracy:
7.2.1 Monitor Relays—Monitor relays shall pick up and
hold from 80 % rated line voltage upwards with the coil at its
maximum operating temperature and shall operate satisfac-
torily in the range from 80 to 120 % of rated line voltage.
7.2.2 Design Voltage Characteristics—Monitors shall be
designed for application on 60 Hz ac and dc current systems
and be designed to operate on electrical systems having
standard voltages acceptable to the U.S. Coast Guard. (See 46
CFR 111.)
7.2.3 Operating Accuracy—Monitors shall alarm within
± 10 % of the ordered set point indicated on the label plate,
when operated in accordance with 7.2.1.
7.3 Installation Instructions:
7.3.1 The monitor vendor shall submit complete installa-
tion instructions with each monitor shipped, including drawings as
necessary, denoting the following information:
7.3.1.1 Application as a motor or generator monitor.
7.3.1.2 Line voltage level to be applied to monitor.
7.3.1.3 Type designation of monitor supplied.
8. Construction Specifications
8.1 General:
8.1.1 Monitors shall be designed for ease of installation
requiring no special tools and shall be fitted with a fastening
device compatible with the vibration criteria established for
marine applications.
8.1.2 Indication of a condition representing a low insulation
value as detected by the monitor shall be displayed by means
of an illuminated device mounted on the body of the monitor.
8.1.3 The monitor shall include voltageless terminals to
which remotely located audible or visual indicators, or both,
can be connected through the use of control cabling. Relay
contacts for this function shall have contacts with a switching
power of 1000 W ac, 100 W dc for a resistive load.
8.1.4 Electrical interface with the monitor shall be through
the use of terminals (or terminal strips), screws and lugs
(solderless crimp or solder types). Splicing will not be used.
The size of terminals and conductors for interfacing the
monitoring shall be suitable to carry the maximum currents
expected during operation.
8.1.5 The monitor’s sensing circuit should be limited to the
following levels:
8.1.5.1 Voltage—not to exceed 24 V.
8.1.5.2 Current—not to exceed 100 µA.
8.1.6 Monitors shall be designed to provide a range of
insulation resistances to be monitored based on the type of
monitor ordered. However, each individual monitor shall be
designed for one or two specific resistance values, and these
values shall be marked on the label plate of the device.

9. Workmanship, Finish, and Appearance
9.1 All workmanship shall be of acceptable commercial
marine standard in all respects and all materials, components or
parts specified shall be new and unused, except for normal
testing, as required.

10. Test Methods
10.1 Routine Tests—Subject each monitor offered for deliv-
er to the following tests:
10.1.1 Visual and mechanical examination.
10.1.2 Operational performance test.
10.2 Visual and Mechanical Examination—Examine the
monitor devices to verify that the materials, design, construc-
tion, dimensions, weight, marking, and workmanship are in
conformance with the vendor’s drawings.
10.3 Operational Performance—Test the completely as-
sembled devices of all functions over the specified line voltage
range (rated line voltage ±20 %). Accuracy of alarm shall be
as stated in 7.2.3.

11. Product Marking
11.1 Each monitor device shall be identified with a perma-
nently applied and clearly marked labelplate indicating the
following information:
11.1.1 Manufacturer’s name and address.
11.1.2 Type designation.
11.1.3 Applicable specification number(s).
11.1.4 Serial number.
11.1.5 Monitor supply voltage.
11.1.6 Monitor control voltage.
11.1.7 Insulation resistance value below which the alarm should be activated.
11.1.8 Ratings and configurations of alarm relay contacts.
11.1.9 Temperature rating.
11.1.10 Date of final test.

12. Keywords

12.1 electrical generator; electrical motors; insulation; low insulation resistance values; marine controller enclosures; resistance monitor; shipboard generator; shipboard motors

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. 1. Scope

1.1 This specification describes the manufacturing requirements for spray shield stock and the fabrication and installation requirements for spray shields made from that stock.

1.1.1 Sections 2-14 address the manufacturing requirements for the spray shield stock. Annex A1 addresses the fabrication and installation requirements for the spray shields.

1.1.2 Fig. 1 shows the typical construction of a spray shield. Figs. 2-6 show methods of installation of a spray shield on various mechanical joints.

1.2 The shields are intended for use around mechanical joints (flanged, bolted unions, and so forth) in liquid piping systems to prevent the impingement of flammable liquid on hot surfaces or fluids onto electrical switchboards and components resulting from a leak in the mechanical joint.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

3. Ordering Information

3.1 ASTM designation and year of issue,
3.2 Length and width required (see 7.1), and
3.3 Type of stainless steel (see 4.1).

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.07 on General Requirements.

2 For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard’s Document Summary page on the ASTM website.

3 Withdrawn.

4 Available from American Association of Textile Chemists and Colorists (AA TCC), One Davis Dr., P.O. Box 12215, Research Triangle Park, NC 27709-2215.

3.4 Type of lacing hardware required (see 4.1.1).

4. Materials and Manufacture

4.1 Lacing hooks, lacing rings, and lacing washers (see Fig. 7) shall be constructed of stainless steel in accordance with Specifications A 176, A 276, or A 580.

4.1.1 Lacing rings may be used instead of lacing hooks where practicable or preferable (see 3.3).

4.1.2 Lacing washers for fastening hooks or rings shall be two-hole washers.

4.2 Stitch wire (Piece 5 in Table 1) shall be constructed of stainless steel in accordance with Specification A 580.

4.3 The aluminized glass cloth, thread, and the protective outer jacket shall be constructed of material as specified in Table 1 and Table 2.

5. Physical and Mechanical Properties

5.1 The physical and mechanical properties for the aluminized glass cloth, thread, and protective outer jacket shall be as specified in Table 1 and Table 2.

6. Requirements

6.1 If lacing hooks or rings are of the type that fasten by stitching, the hooks or rings shall be attached to the backup washers using a wire stitch machine and wire (Pieces 5 or 8 in Table 1).

6.2 Lacing anchor/self-locking washer-type systems shall not be used on spray shields.

7. Dimensions and Permissible Variations

7.1 The material for shields shall be standardized as given in Table 3 tolerances to be +1/4 in. (6 mm) and −0 in. for width.
8. Workmanship, Finish, and Appearance

8.1 The seam on both sides of the spray shield shall be intact.

8.1.1 On drawstring-type shields, there shall be ample overlap in the seam to allow wire to be run through the entire length of the shield.

8.2 There shall be no tears in the uncovered aluminum portion of the shield where contact is made with the mechanical joint (see Fig. 1).

8.3 There shall be no tears in the protective outer jacket such that the aluminized glass cloth underneath is exposed.

8.4 There shall be no holes or openings of any kind in the shields other than those made by sewing or the attachment of lacing hooks or rings.

9. Sampling, Selection, and Number of Specimens

9.1 Unless otherwise specified, the sampling of, selection of, and number of specimens for the aluminized glass cloth, thread, and protective outer jacket shall be as specified in the applicable test methods listed in Table 1 and Table 2.

10. Test Methods

10.1 The methods for testing the aluminized glass cloth, thread, and protective outer jacket shall be as specified in Table 1 and Table 2.

11. Inspection

11.1 Unless otherwise specified in the contract or purchase order, the contractor is responsible for performing inspections to determine conformance to the requirements specified in Section 8 of this specification.

12. Rejection and Rehearing

12.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the producer or supplier may make claim for a rehearing.

13. Product Marking

13.1 Indelible stamp denoting the width of the shield shall be placed at 24-in. (610-mm) intervals on the visible foil side of the shield so that it will be visible when the shield is rolled and packaged.

14. Packaging and Package Marking

14.1 The packaging, packing, and marking of containers shall be in accordance with Practice D 3951, with the exceptions noted in 14.1.1 and 14.1.2.

14.1.1 Each container used for spray shield packaging shall contain installation instructions as shown in Annex A2.

14.1.2 Metal strapping shall not be used for container closure and reinforcement.

14.2 Installed lacing hooks and aluminized cloth shall be so packaged that there shall be no damage to the cloth during shipment.

ANNEXES

(Mandatory Information)

The requirements of this section apply only to the fabrication and installation of the spray shields.

A1. FABRICATION OF SPRAY SHIELDS

A1.1 To determine spray shield length and width, the flange that is to be shielded shall be measured as follows:

A1.1.1 Shield length:
Measure the circumference of the flange. Add an overlap of \( \frac{1}{4} \) of the circumference measurement, with the maximum being 8 in. (203 mm) and the minimum being 1 in. (25 mm).
A1.1.1.1 To prevent dirt accumulation, the overlap shall be pointed downward (see Fig. A1.1).

A1.1.2 Shield width:
Measure from the inside edge of the bolt to the edge of the flange (A). Measure the combined flange thickness (B). In the following illustration, this would be “A + B + A” as a minimum requirement.

A1.1.2.1 If the measured width contains a fraction, the next wider shield stock shall be used (see 7.1). For example, if the measured width is 5\(\frac{1}{2}\) in. (140 mm), 6-in. (152-mm) wide shield stock shall be used.

<table>

NOTE 1—Maximum overlap is 8 in. (203 mm).
NOTE 2—Minimum overlap is 1 in. (25 mm).
A2. INSTALLATION OF SPRAY SHIELDS

A2.1 General Installation:
A2.1.1 The shield shall be centered on the joint, wrapped snugly around the sides of the joint, and laced tightly with wire.

A2.2 Standard Installation:
A2.2.1 Cut two lengths of lacing wire 6 in. (152 mm) longer than the length of the shield.
A2.2.2 Cut away seam material on each side of overlap and insert lengths of wire into seams on both sides of shield until the wire emerges at the other end.
A2.2.3 Wrap shield around flange with aluminized cloth on the inside.
A2.2.4 Fold shield edges down over flange bolts.
A2.2.5 Twist ends of wire together sufficiently to maintain tightness, cut excessive wire, and fold down to be flat on shield. If additional tightness is required, use the lacing hooks shown in Fig. 7.

A2.3 Optional Installation (Lacing Hooks or Rings):
A2.3.1 Cut away seam material on each side of overlap. There shall be a 5/8-in. (16-mm) space between the end of shield overlap and the first pair of lacing hooks.
A2.3.1.1 Remove lacing hooks that would be under the overlap.
A2.3.2 Wrap shield around flange with aluminized glass cloth on the inside.
A2.3.3 Fold shield edges down over flange bolts.
A2.3.4 String wire through hooks on both sides and pull tight to secure shield in place.
A2.3.5 Twist end of wire together sufficiently to maintain tightness, cut excessive wire, and fold down to be flat on shield.
Standard Specification for Steam Traps and Drains

This standard is issued under the fixed designation F 1139; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides the minimum requirements for the design, fabrication, pressure rating, marking, and testing of steam traps and drains.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 The following safety hazards caveat pertains only to the test method portion of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ANSI Standards:
B16.1 Cast Iron Pipe Flanges and Flanged Fittings
B16.3 Malleable-Iron Screwed Fittings
B16.4 Cast-Iron Screwed Fittings
B16.5 Steel Pipe Flanges and Flanged Fittings
B16.11 Forged Steel Fittings Socket-Welding and Threaded
B16.15 Cast Bronze Screwed Fittings
B16.18 Cast Bronze Solder-Joint Pressure Fittings
B16.22 Wrought Copper and Bronze Solder-Joint Pressure Fittings
B16.24 Bronze Flanges and Flanged Fittings
B16.34 Steel Valves, Flanged and Butt weld Ends
B31.1 Power Piping

2.2 MSS Standards:
SP-25 Standard Marking System for Valves, Fittings, Flanges, and Unions
SP-51 150 lb Corrosion Resisting Cast Flanges and Flanged Fittings

2.3 ASME Standards:
ANSI/ASME PTC 39.1 Condensate Removal Devices for Steam Systems
ASME Boiler and Pressure Vessel Code, Section VIII, Division I, Pressure Vessels
ASME Boiler and Pressure Vessel Code, Section IX, Welding and Brazing Qualifications

3. Definitions of Terms Specific to This Standard

3.1 cold condensate capacity (QC)—maximum mass of condensate that the steam trap/drain can discharge in 1 h at a given pressure and temperature, the trap/drain being fully open (lb/h (kg/h)).

3.2 drain—device having no moving parts permitting the discharge of fluids at a fixed or adjustable rate.

3.3 hot condensate capacity (QH)—maximum mass of condensate that a steam trap/drain can discharge in 1 h at a given pressure and temperature (lb/h (kg/h)).

3.4 hydrostatic proof test (PTHP)—test used in determining maximum allowable pressure (PMA) and maximum allowable temperature (TMA) (lb/in.² (kg/mm²)).

3.5 maximum allowable pressure (PMA)—maximum pressure that the shell of the steam trap/drain can withstand permanently at a given temperature (lb/in.² (kg/mm²)).

3.6 maximum allowable temperature (TMA)—maximum temperature to which the shell of the steam trap/drain can be raised permanently (°F (°C)).

3.7 maximum differential pressure (ΔPMX)—maximum difference between operating pressure and operating back pressure (lb/in.² (kg/mm²)).

3.8 maximum operating back pressure (PMOB)—maximum permissible pressure measured at the outlet of the steam trap/drain allowing correct functioning (lb/in.² (kg/mm²)).

3.9 maximum operating pressure (PMO)—pressure for which a steam trap/drain is rated by the manufacturer.

---

2 This specification was developed from Fluid Controls Institute Standards, 69-1 Pressure Rating Standards for Steam Traps and 85-1 Standard Production Test for Steam Traps.

3 Available from American National Standards Institute, 25 W. 43rd St., 4th Floor, New York, NY 10036.

4 Available from Manufacturer’s Standardization Society of the Valve and Fittings Industry, Inc., 1815 N. Fort Myers Dr., Arlington, VA 22209.

5 Available from American Society of Mechanical Engineers, Three Park Ave., New York, NY 10016-5990.
3.9.1 Discussion—This pressure is normally a function of the limitations related to the internal mechanism of the steam trap/drain (lb/in.² (kg/mm²)).

3.10 Maximum test pressure (PTMX)—maximum pressure applied to the steam trap/drain under test including its internal mechanism (lb/in.² (kg/mm²)).

3.11 Minimum differential pressure (ΔPMN)—minimum difference between operating pressure and operating back pressure (lb/in.² (kg/mm²)).

3.12 Operating back pressure (POB)—pressure measured at the outlet of the steam trap/drain under operating conditions (lb/in.² (kg/mm²)).

3.13 Operating differential pressure (ΔP)—difference between the operating pressure and the operating back pressure (lb/in.² (kg/mm²)).

3.14 Operating pressure (PO)—pressure measured at the inlet of the steam trap/drain under operating conditions (lb/in.² (kg/mm²)).

3.15 Operating temperature (TO)—temperature measured at the inlet of the steam trap/drain under operating conditions (°F (°C)).

3.16 Performance characteristics tests—tests carried out to determine the operational characteristics of a particular design of steam trap/drain.

3.17 Production tests—tests carried out by the manufacturer to confirm that the steam trap/drain functions correctly.

3.18 Steam trap—self-contained valve that automatically drains the condensate from a steam containing enclosure while remaining tight to live steam, or if necessary, allowing steam to flow at a controlled or adjusted rate.

3.18.1 Discussion—Most steam traps will also pass noncondensible gases while remaining tight to live steam.

4. Ordering Information

4.1 Orders for products under this specification shall include the following information as applicable:

4.1.1 Performance characteristics required—See Section 7.

4.1.2 Certification of performance characteristics if required. See Section 7.

4.1.3 Nominal pipe size.

4.1.4 Maximum operating pressure, psig (kPa). See 3.5.

4.1.5 Capacity, lb/h (kg/h) (QC or QH). See 3.17 and 3.18.

4.1.6 Connection type (that is, threaded, socket weld, flanged). See 5.2.1.

4.1.7 Materials—external and internal.

4.1.8 Type of trap/drain.

4.1.9 Maximum test pressure, psig (kPa). See 3.12.

4.1.11 Pressure differential (operating, maximum, or minimum, or combination thereof).

4.1.12 Notice for Acceptance Test—If the purchaser wishes to witness the production tests, this shall be specified in the order. See 8.2.

5. Materials and Manufacture

5.1 Materials:

5.1.1 The pressure ratings established under this specification are based upon materials of high quality produced under regular control of chemical and mechanical properties by a recognized process. The manufacturer shall be prepared to certify that his product has been so produced and that the mechanical and chemical properties thereof, as proved by test specimens and nondestructive testing or as documented by certifications from the producer or recognized distributor of these materials, are at least equal to the requirements of the appropriate specifications.

5.1.2 housings of traps/drains, and other parts or bolting, or combination thereof, used for pressure retention, shall be constructed of materials in accordance with ANSI/ASME B31.1 or Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

5.1.3 Seals and parts, in addition to pressure containing parts and bolting used for pressure retention, shall be of materials suitable for the service.

5.1.4 Users are cautioned against applications with fluids that may react chemically with any materials used in these products.

5.1.5 For materials not having values of allowable stress tabulated in Section VIII, Division 1, allowable stresses shall be determined in accordance with the procedures outlined in Subsection C and Appendix P of Section VIII of the ASME Boiler and Pressure Vessel Code. Where it can be shown that the values of allowable stress listed for a particular material in one product form (because of similar chemistry, mechanical properties, directional properties, heat treatment, and so forth) are applicable to the same material in an unlisted product form, the listed values of allowable stress may be used.

5.2 Manufacture:

5.2.1 Steam traps/drains with end fittings in compliance with the following standards may be used within the pressure-temperature ranges permitted by the applicable standard provided the trap/drain housing (less end fittings) is satisfactory for these conditions:

5.2.1.1 ANSI B16.1, 5.2.1.2 ANSI B16.3, 5.2.1.3 ANSI B16.4, 5.2.1.4 ANSI B16.5, 5.2.1.5 ANSI B16.11, 5.2.1.6 ANSI B16.15, 5.2.1.7 ANSI B16.18, 5.2.1.8 ANSI B16.22, 5.2.1.9 ANSI B16.24, 5.2.1.10 ANSI B16.34, and 5.2.1.11 MSS SP-51.

5.2.2 Weld design details, welding, and nondestructive testing shall be in accordance with Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code. Welders and weld procedures shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

6. Requirements

6.1 Pressure Rating and Design:
6.1.1 The maximum allowable pressure (PMA) and maximum allowable temperature (TMA) rating for steam traps/drains conforming to this specification shall be established by at least one of the following methods:

6.1.1.1 Proof test in accordance with the requirements prescribed in paragraph UG-101 of Section VIII of the ASME Boiler and Pressure Vessel Code. If burst-type tests as outlined in UG-101(m) are used, it is not necessary to rupture the component. In this case, the value of “B” to be used in determining the maximum allowable pressure shall be the maximum pressure to which the component was subjected without rupture. Safety of personnel shall be given serious consideration when conducting hydrostatic tests. Components that have been subjected to a hydrostatic proof test shall not be offered for sale.

6.1.1.2 Design calculations in accordance with the requirements prescribed in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

6.1.1.3 Hydrostatic proof test of a representative production sample to establish the maximum allowable pressure (PMA) and maximum allowable temperature (TMA) rating as described in 8.1.

6.1.1.4 Extensive and successful performance experience under comparable service conditions with similarly proportioned components of the same or similar material may be used as a basis for rating provided all other provisions of this specification are met.

6.2 Production Tests:
6.2.1 The manufacturer shall production test every steam trap/drain as described in Section 8 by one of the following test methods:

6.2.1.1 Hydrostatic—See 8.2.
6.2.1.2 Steam—See 8.3.
6.2.1.3 Air—See 8.4.

6.2.2 Samples of the traps/drains shall be visually examined and dimensionally checked to ensure that the traps/drains correspond to this specification and are marked in accordance with Section 9.

6.2.3 Sample steam traps/drains shall be given an operational check steam test to ensure that they open to discharge condensate and close satisfactorily in accordance with 8.5. This test does not apply to labyrinth (orifice) steam traps/drains.

7. Performance Characteristics

7.1 A manufacturer may describe the operation of a particular type of steam trap or drain by referring to one or more of the performance characteristics. When this is done, the associated tests described in 8.6 must be performed on a representative production sample. A brief explanation of the derivation of each characteristic is given as follows. Further details on test methods are specified in Section 8.

7.1.1 Certification of performance characteristics shall be available if required by the purchaser (see 4.1.2).

7.2 Minimum Operating Pressure—The steam trap shall be tested to determine the minimum pressure (atmospheric or above) at which correct opening and closing will occur.

7.3 Maximum Operating Pressure (PMO) —The steam trap shall be tested to determine the maximum pressure at which correct opening and closing will occur.

7.4 Maximum Operating Back Pressure (PMOB) —The steam trap shall be tested to determine the maximum pressure permissible at the outlet of the device that allows correct functioning.

7.5 Air Venting Capability —The steam trap/drain shall be tested to determine its ability to discharge air and other noncondensable gases.

7.6 Operating Temperature (TO) —The steam trap/drain shall be tested to determine the temperature at which the device operates and, in particular, the temperature at which it passes its specified capacity.

7.7 Condensate Capacity (QH or QC) —The steam trap/drain shall be flow tested to determine its condensate capacity throughout its operating pressure range.

7.8 Live Steam Loss —The steam trap shall be tested to determine the amount of live steam lost through the trap.

8. Test Methods

8.1 Hydrostatic Proof Test —Establish the maximum allowable pressure (PMA) and temperature (TMA) rating using a hydrostatic proof test of a representative production sample, chosen in accordance with 6.1.1.3 and perform as follows:

\[
\text{PMA} = \frac{\text{PTHP}(T)}{5} \times \frac{\text{average tensile of test specimens of pressure retaining components}}{\text{stress value at design temperature}} \times \frac{\text{stress value at test temperature}}{
\]

8.1.1 Determine stress values in accordance with Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code or ANSI B31.1.

8.1.2 Casting quality factor (f) shall be 1.0 for wrought materials and 0.8 for castings.

8.1.3 Gasket leakage during test does not constitute failure unless a result of rupture of a pressure containing part.

8.1.4 Do not exceed water temperature of 125°F (50°C) during the test.

8.1.5 Retain certification of the hydrostatic proof test by the manufacturer and make available upon request.

8.2 Hydrostatic Production Shell Test —Give steam traps/drains a hydrostatic shell test at a pressure of 1.5 times its maximum allowable pressure rating at 68°F (20°C).

8.2.1 Do not exceed water temperature of 125°F (50°C) during the hydrostatic test.

8.2.2 The minimum duration of the shell test shall be as follows:

<table>
<thead>
<tr>
<th>Nominal Pipe Size</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>¼ through 2 (6-50 mm)</td>
<td>15 s</td>
</tr>
<tr>
<td>2½ through 8 (65-200 mm)</td>
<td>1 min</td>
</tr>
<tr>
<td>10 and over (250 mm)</td>
<td>3 min</td>
</tr>
</tbody>
</table>

8.2.2.1 Because of the complexity of product shape and size, the duration of the hydrostatic test may vary, but in no case shall this duration be less than that given in 8.2.2.

8.2.3 No visible leakage through pressure boundary walls or structural damage shall be evident during the shell tests.
8.3 Steam Production Shell Test—Test steam traps and drains no larger than 2-in. (50-mm) pipe size on saturated steam at their maximum operating pressure but not to exceed 250 psig (1820 kPa).

8.3.1 The minimum duration of the shell test shall be 15 s.

8.3.2 If this option is exercised, the manufacturer shall be able to certify that a prototype from each production lot of the same size steam trap/drain tested in this manner was subjected to a hydrostatic shell test in accordance with 8.2.

8.3.3 Show no visible leakage or structural damage during the shell tests.

8.4 Air Production Shell Test—Test traps and drains no larger than 2-in. (50-mm) pipe size for shell leaks on air at ambient temperature and 80 psi (551 kPa).

8.4.1 The minimum duration of the shell test shall be 15 s.

8.4.2 If this option is exercised, the manufacturer shall be able to certify that a prototype from each production lot of the same size steam trap/drain tested in this manner was subjected to a hydrostatic shell test in accordance with 8.2.

8.4.3 Visually detectable leakage through the pressure retaing walls is not acceptable.

8.5 Operational Check Steam Test—Feed the steam trap with steam and introduce condensate intermittently. When only steam is present, the steam trap shall close. On the introduction of condensate, the steam trap shall open (the time taken will vary as a function of the steam trap type). When the condensate has been discharged, the steam trap shall close again when steam enters the trap. The test is satisfied when at least one complete cycle has been performed.

8.6 Performance Characteristics Tests:

8.6.1 Determination of Minimum Operating Pressure—Carry out operational checks, as described in 8.5, while successively reducing the test pressure until the steam trap fails to open and close correctly. The minimum operating pressure is the lowest test pressure at which correct operation is observed.

8.6.2 Determination of Maximum Operating Pressure—Verify the maximum operating pressure of the steam trap by carrying out operational checks, as described in 8.5, while successively increasing the test pressure up to the steam trap’s maximum operating pressure. The steam trap shall open and close correctly throughout the test.

8.6.3 Determination of Maximum Operating Back Pressure—Carry out operational checks, as described in 8.5, with the outlet from the steam trap connected to a vessel in which the pressure can be raised, independent of the test pressure upstream of the steam trap. While maintaining a reference pressure at the steam trap inlet, successively raise the pressure at its outlet until the steam trap fails to open and close correctly. The maximum operating back pressure is the highest pressure applied to the steam trap outlet at which correct operation is still observed.

8.6.4 Determination of Air Venting Capability—Introduce air at a specified temperature into the trap or upstream piping. Check the air venting capability by an air flow measurement carried out at minimum and maximum operating pressure. Record the temperature at the trap inlet.

8.6.5 Determination of Operating Temperature—Feed steam into the steam trap to effect closure. Introduce condensate, at saturation steam temperature, and, unless the steam trap opens immediately, allow to cool slowly at the steam trap’s inlet. The operating temperature is the temperature of the condensate, measured at the inlet to the trap, at which the trap opens sufficiently to pass its specified capacity.

8.6.6 Determination of Condensate Capacity—Determine the capacity of the steam trap/drain by measuring the amount of condensate that is discharged from the device under specified conditions of pressure, pressure differential, and condensate temperature. Carry out the test with condensate at different temperatures and at different pressure within the steam trap/drain’s operating range in accordance with ANSI/ASME PTC 39.1.

8.6.7 Determination of Live Steam Loss—Use several methods to determine the amount of live steam lost, if any, by the steam trap/drain in accordance with ANSI/ASME PTC 39.1.

9. Product Marking

9.1 Each steam trap/drain shall as a minimum be permanently marked with the following information:

9.1.1 Manufacturer’s name or trademark.

9.1.2 Maximum operating pressure (PMO) or maximum differential pressure (ΔPMX) rating.

9.1.3 Maximum allowable pressure (PMA).

9.1.4 Indication of flow direction (arrow or word “inlet'' or “outlet,’’ or both).

9.1.5 ASTM designation of this specification.

9.2 Flanges, butt welding, threaded, or other ends complying with a standard listed in 5.2.1 may be marked in accordance with the applicable requirements of MSS SP-25 for dimensional identification purpose if desired.

9.3 Omission of Markings on Trap/Drain Body—On traps/drains whose size or shape limit the markings, markings shall be applied on an identification plate securely attached to the body. In no case shall the markings be hidden by the fixing elements of the steam trap.

9.4 Additional Markings—A manufacturer having complied with the requirements of Section 9 may include the following:

9.4.1 Mark any of the above mentioned items in more than one place, for example, if any item is marked on the body, it may also be repeated on an identification plate; or

9.4.2 Add any other markings, for example, catalog item numbers, providing that there is no risk of confusion between these markings and those mentioned in Section 9.

10. Quality Control

10.1 The trap/drain manufacturer shall maintain the quality of the traps/drain that are designed, tested, and marked in accordance with this specification. At no time shall a trap/drain be sold with this specification designation that does not meet the requirements herein.

11. Keywords

11.1 fluid discharge; steam drains; steam traps; valve
Standard Specification for Manhole Cover Assembly, Bolted, Semi-Flush, Oiltight and Watertight

This standard is issued under the fixed designation F 1142; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides design and construction criteria for a semi-flush, oiltight, and watertight bolted manhole cover assembly.

1.2 The manhole cover assembly depicted in this specification is for use in decks or bulkheads requiring oiltight and watertight covers that are not required to be completely flush. Manhole cover assemblies shall be complete with covers, mounting rings, gaskets, welded studs, washers, and nuts.

1.3 Handles, if required, shall be as specified in the ordering information.

1.4 The values stated in inch pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 This specification is not applicable to certain hazardous cargos (see Section 46 CFR 153.254 and 46 CFR 154.340).

1.6 This specification provides design and construction for manhole cover assemblies subjected to lateral pressures such as resulting from vehicle loads or hydrostatic pressures. Where manhole cover assemblies are subjected to primary or cyclic loads, other reinforcement or construction criteria may be necessary to integrate the manhole assembly with the required structural reinforcement for openings in decks or bulkheads. Design of the manhole cover assembly for primary or cyclic loads is beyond the scope of this specification.

3. Terminology

3.1 Definitions:
   - manhole—an accessway located in a tank structure.
   - semi-flush—placement of the cover over the ringed opening (without coaming).

4. Classification

4.1 Type I—15-in. (381-mm) size of access opening. Type II—18-in. (457-mm) size of access opening.

4.2 Grade 1—1/2-in. (9.5-mm) thick cover plate. Grade 2—3/4-in. (12.7-mm) thick cover plate. Grade 3—1/2-in. (12.7-mm) thick cover plate.

4.3 Class A Manhole Cover Assemblies—Class A manhole cover assemblies shall be abrasive blasted to near white metal in accordance with SSPC SP-10, and a commercial marine quality, nonhazardous, corrosion-inhibiting, and oil-resistant
primer coating be applied for protection for a period of one year during shipping and in shipyard handling.

4.4 Class B Manhole Cover Assemblies—Class B manhole cover assemblies shall be galvanized in accordance with Specification A 153/A 153M.

5. Ordering Information

5.1 The purchasers ordering information shall include the following:

5.1.1 ASTM designation and year of issue,
5.1.2 Type (see 4.1),
5.1.3 Grade (see 4.2),
5.1.4 Class (see 4.3),
5.1.5 Quantity,
5.1.6 Remarks—Handles (are/are not) required,
5.1.7 Approval—Classification Society approval (is/is not) required, and
5.1.8 Gasket, if other than specified (see 6.6).

6. Materials and Manufacture

6.1 Plate for the cover and the ring shall be of Specifications A 36/A 36M or A 131/A 131M steel.
6.2 Round bar for the handle shall be in accordance with Specification F 783, Type A.
6.3 Welded studs shall be ¼-in. (19.05-mm) 10 UNC-2A by 1¼ in. (44.4 mm) long and manufactured of ordinary steel to commercial standards. Threads shall be the coarse thread series as specified in the latest issue of ANSI B1.1.
6.4 Washers shall be ANSI B18.2.1 Type A, ¼-in. (19.05-mm) washer, 2-in. (50.8-mm) by 0.148-in. (3.8-mm) thick standard flat manufactured of yellow brass, Specification B 36/B 36M.
6.5 Heavy hex nuts shall be ¼-in. (19.05-mm) 10 UNC-2B and manufactured of yellow brass, Specification B 36/B 36. Threads in nuts shall conform to the dimensions for coarse threads with tolerances prescribed in ANSI B1.1. The nuts shall conform to dimensions prescribed in ANSI B18.2.1.
6.6 Unless otherwise specified in ordering information, gasket shall be rubber, ⅛ in. (4.8 mm) thick, 50 ± 5 durometer prescribed per Classification D 2000 5BC507 A14 E034. Manhole cover assemblies for government application, see Annex A2 for type of gasket.
6.7 Welding shall conform to the latest issue of the American Bureau of Shipping rules or other classification society rules as may be applicable.
6.8 Details of bolted manhole cover assembly are shown in Fig. 1.

7. Dimensions

7.1 Dimensions of manhole cover assembly shall be as indicated in Table 1.
7.2 For plating up to and including ¼-in. (6.4-mm) thickness, use cover plate of ¼-in. (6.4-mm) thickness. Plating over ¼ in. (6.4 mm) up to, and including ⅛-in. (9.5-mm) thickness, use cover plate of ⅛-in. (9.5-mm) thickness. Plating over ⅛-in. (9.5-mm) thickness, use cover plate of ½-in. (12.7-mm) thickness.

8. Workmanship, Finish, and Appearance

8.1 Items produced under this specification shall be free of splinters, sharp edges, burrs, projections, and weld spatters.

9. Sampling

9.1 For orders for one or two manhole cover assemblies, each manhole cover assembly shall be inspected.
9.2 For orders for three to ten manhole cover assemblies, two manhole cover assemblies shall be selected at random. If any one of them fails to meet requirements, then all manholes in the order shall be inspected.
9.3 For orders for more than ten manhole cover assemblies, they shall be separated into groups of ten (or fraction thereof) for sampling purposes.

10. Inspection and Testing

10.1 Responsibility—Unless otherwise specified in the order, the manufacturer is responsible for the performance of all inspection and testing specified herein. The manufacturer may use his own facilities or any commercial facility acceptable to the purchaser. The purchaser reserves the right to perform any of the inspections and tests set forth where such are deemed necessary to assure that supplies conform to prescribed requirements. Nonconforming manhole cover assemblies shall not be offered for delivery.
10.2 Inspection—The dimensions of the manhole cover assembly and its components shall be checked to ensure that they are within specified tolerances.
10.3 Test Methods—Each manhole cover assembly shall be designed to the pressure listed in Table 1 and tested to a pressure equal to 1.5 times the design pressure. The test pressure shall be held for a minimum of 5 min. There shall be no visible sign of leakage, permanent deformation, or other indications of structural failure of the manhole cover assembly.
10.3.1 Before delivery, the manhole cover assemblies shall be certified as to their watertight and oiltight integrity. Groups of manhole cover assemblies whose representative samples pass the tightness test shall be certified for watertight and oiltight integrity to their design pressure.

11. Product Marking

11.1 Each manhole cover assembly shall be marked with the purchase order number, item number from purchase order, ASTM designation number, type, grade, class, and manufacturer’s name. Marking may be done by paint, stencil, or weatherproof tag.

12. Packaging and Package Marking

12.1 Unless otherwise specified, packaging shall conform to manufacturer’s normal commercial practice, and in such a manner that will ensure acceptance by common carrier and afford protection against physical damage during shipment. Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.
12.2 For government procurements for long-term storage or overseas shipment, the requirements of Annex A1 apply. In such case, the required level of packaging shall be specified.
FIG. 1 Manhole Cover Assembly, Bolted, Semi-Flush, Oiltight and Watertight

NOTE 1—1 in. = 25.4 mm.

a The letters in the headings designate the following:

- **A** = number of spaces on straight side,
- **B** = bolt spacing (straight side),
- **C** = total span,
- **D** = number of spaces on arc side,
- **E** = bolt spacing (arc side),
- **F** = arc span,
- **G** = accessway inner radius,
- **H** = seat and gasket inner radius,
- **I** = bolt circle arc radius,
- **J** = seat and gasket outer radius, and
- **K** = offset for radii from center of accessway and cover.

ANNEXES
(Mandatory Information)

A1. PACKING FOR DoD PROCUREMENTS (GOVERNMENT APPLICATIONS)

A1.1 Referenced Documents (for this annex only)

A1.1.1 Federal Standards:
- PPP-B-576 Box, Wood, Cleated, Veneer, Paper Overlaid
- PPP-B-585 Boxes, Wood, Wirebound
- PPP-B-591 Boxes, Fiberboard, Wood-Cleated
- PPP-B-601 Boxes, Wood, Cleated—Plywood
- PPP-B-621 Boxes, Wood, Nailed and Lock Corner
- PPP-B-636 Box, Fiberboard
- PPP-B-640 Boxes, Fiberboard, Corrugated, Triple, Wall

A1.1.2 Military Standard:
- MIL-STD-129 Marking for Shipment and Storage

A1.1.3 Official Classification Committee Standard:
- Uniform Freight Classification Rules

A1.2 Packing—The manhole cover assembly shall be cushioned, blocked, or braced within the container in a manner to prohibit movement. Unless otherwise specified in the order, one manhole cover assembly shall be packed per container.

When more than one manhole cover assembly is required to be packed in each container, the gross mass of the wood or wood-cleated boxes shall not exceed approximately 100 kg.

A1.2.1 Level A
Manhole cover assembly shall be packed in containers conforming to any one of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification:</th>
<th>Type or Class:</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>

</tbody>
</table>

A2. DoD MANHOLE COVER ASSEMBLY SPECIAL APPLICATION

A2.1 Referenced Documents (for this annex only)

A2.1.1 Military Standards:
- MIL-C-6183 Cork and Rubber Composition Sheet for Aromatic Fuel and Oil Resistant Gaskets
- MIL-G-1149 Gasket Materials, Synthetic Rubber 50 and 65 Durometer Hardness
- MIL-R-900 Rubber Gasket Material, 45 Durometer Hardness
- MIL-R-83248 Rubber Fluorocarbon Elastomer, High Temperature, Fluid and Compression Set Resistant

A2.2 Gasket materials used in DoD manhole cover assemblies shall be as follows:

<table>
<thead>
<tr>
<th>Manhole Cover Assembly Service</th>
<th>Required Gasket Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>General service</td>
<td>MIL-R-900</td>
</tr>
<tr>

<td>MIL-C-6183, Class 1</td>
</tr>
<tr>
<td>Hydraulic machinery spaces using phosphate ester-based hydraulic fluid</td>
<td>MIL-R-83248</td>
</tr>
</tbody>
</table>

A2.3 DoD manhole covers shall be Class B.
Standard Specification for Manhole Cover Assembly, Bolted, Raised, Oiltight and Watertight

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting and Deck Machinery.

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting and Deck Machinery.

1. Scope

1.1 This specification provides design and construction criteria for a raised, bolted, oiltight, and watertight manhole cover assembly.

1.2 The manhole cover assemblies depicted in this specification are for use in decks or bulkheads in which the manhole cover assemblies must be of the raised type. Manhole cover shall be complete with coaming, gasket, welded studs or bolts, washers, and nuts.

1.3 Determination of the use of handles will be as specified in the ordering information.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 This specification is not applicable to certain hazardous cargos (see Section 46 CFR 153.254 and 46 CFR 154.340).

1.6 This specification provides design and construction for manhole cover assemblies subjected to lateral pressures such as resulting from vehicle loads or hydrostatic pressures. Where manhole cover assemblies are subjected to primary or cyclic loads, other reinforcement or construction criteria may be necessary to integrate the manhole assembly with the required structural reinforcement for openings in decks or bulkheads. Design of the manhole cover assembly for primary or cyclic loads is beyond the scope of this specification.

2. Referenced Documents

2.1 ASTM Standards:

A 36/A 36M Specification for Structural Steel
A 131/A 131M Specification for Structural Steel for Ships
A 153/A 153M Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
B 36/B 36M Specification for Brass Plate, Sheet, Strip, and Rolled Bar

D 2000 Classification System for Rubber Products in Automotive Applications
F 783 Specification for Staple, Handgrab, Handle, and Stirrup Rung

2.2 ANSI Standards:

B1.1 Unified Inch Screw Threads
ANSI Y14.5M Dimensioning and Tolerancing
B18.2.1 Square and Hex Bolts and Screws, Inch Series

2.3 American Bureau of Shipping Standard:

Rules for Building and Classing Steel Vessels

2.4 Steel Structures Painting Council Standard:

SP-10 Surface Preparation Specification No. 10

2.5 Code of Federal Regulations Standard:

CFR 46 Code of Federal Regulations

3. Terminology

3.1 Definitions:

3.1.1 manhole—an accessway located in a tank structure.

3.1.2 raised—manhole cover seat is located on an angle or flat bar coaming which protrudes from the tank structure into the space from which it is accessed.

4. Classification

4.1 Type I—15- by 23-in. (381- by 584-mm) size of access opening. Type II—18- by 24-in. (457- by 610-mm) size of access opening.

4.2 Grade 1—1/4-in. (6.35-mm) thick cover plate. Grade 2—3/8-in. (9.5-mm) thick cover plate. Grade 3—1/2-in. (13-mm) thick cover plate.

4.3 Class A Manhole Cover Assemblies—Class A manhole cover assemblies shall be abrasive blasted to near white metal in accordance with SSPC SP-10 and a commercial marine quality nonhazardous corrosion-inhibiting and oil-resistant primer coating be applied for protection for a period of one year during shipping and in shipyard handling.

5 Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036.

4.4 Class B Manhole Cover Assemblies—Class B manhole cover assemblies shall be galvanized in accordance with Specification A 153/A 153M.

5. Ordering Information

5.1 The purchasers’ ordering information shall include the following information:

5.1.1 ASTM designation and year of issue,
5.1.2 Type (see 4.1),
5.1.3 Grade (see 4.2),
5.1.4 Class (see 4.3 and 4.4),
5.1.5 Shape (rectangular or oval) (see Fig. 1 and Fig. 2),
5.1.6 Quantity,
5.1.7 Remarks—Handles (are/are not) required, and
5.1.8 Approval—Classification society approval (is/is not) required.

5.1.9 Gasket, if other than specified (see 6.7).

6. Materials and Manufacture

6.1 Plate for the cover to be of Specifications A 36/A 36M or A 131/A 131M steel.

6.2 Coaming to be of Specifications A 36/A 36M or A 131/A 131M steel.

6.3 Round bar for the handle shall be in accordance with Specification F 783, Type A.

6.4 Bolts shall be ¼ in. (19.05 mm) by 2 ¾ in. (57 mm) long. Welded studs shall be ¼ in. (19.05 mm) by 1 ¾ in. (44.4 mm) long. Bolts or welded studs shall be manufactured of ordinary steel to commercial standards. Threads shall be the coarse thread series as specified in the latest issue of ANSI B1.1.

6.5 Washers shall be ANSI B18.2.1 Type A, ¾-in. (19.05-mm) washer, 2-in. (50.8-mm) by 0.148-in. (3.8-mm) thick standard flat manufactured of yellow brass, Specification B 36/B 36M.

6.6 Heavy hex nuts shall be ¾ in. (19.05 mm) and manufactured of yellow brass, Specification B 36/B 36M. Threads in nuts shall conform to the dimensions for coarse threads with tolerances prescribed in ANSI B1.1. The nut shall conform to dimensions prescribed in ANSI B18.2.1.

6.7 Unless otherwise specified in ordering information, gasket shall be rubber, ⅝ in. (4.8 mm) thick, 50 ± 5 durometer, or other such classification society rules as may be applicable. Manhole cover assemblies for government application see Annex A2 for type of gaskets.

6.8 Welding to conform to the latest issue of the American Bureau of Shipping Rules per Classification D 2000 5BC507 A14 E034.

6.9 Details of bolted manhole cover assembly is shown in Fig. 1 and Fig. 2.

7. Dimensions and Permissible Variations

7.1 Dimensions of manhole assembly shall be as indicated in Table 1 and Table 2.

7.2 For plating up to and including ¼-in. (6.4-mm) thickness, use cover plate of ¼-in. (6.4-mm) thickness. Plating over ¼-in. (6.4-mm) up to, and including ⅜-in. (9.5-mm) thickness, use cover plate of ⅜-in. (9.5-mm) thickness. Plating over ⅜-in. (9.5-mm) up to, and including ½-in. (12.7-mm) thickness.

8. Workmanship, Finish, and Appearance

8.1 Items produced under this specification shall be free of splinters, sharp edges, burrs, projections, and weld spatters.

9. Sampling

9.1 For orders for one or two manhole cover assemblies, each manhole cover assembly shall be inspected.

9.2 For orders for three to ten manhole cover assemblies, two manhole cover assemblies shall be selected at random. If any one of them fails to meet requirements, then all manhole cover assemblies in the order shall be inspected.

9.3 For orders for more than ten manhole cover assemblies, they shall be separated into groups of ten (or fraction thereof) for sampling purposes.

10. Inspection and Testing

10.1 Responsibility—Unless otherwise in the order, the manufacturer is responsible for the performance of all inspection and testing specified herein. The manufacturer may use his own facilities or any commercial facility acceptable to the purchaser. The purchaser reserves the right to perform any of the inspections and tests set forth where such are deemed necessary to assure that supplies conform to prescribed requirements. Nonconforming manhole cover assemblies shall not be offered for delivery.

10.2 Inspection—The dimensions of the manhole cover assembly and its components shall be checked to ensure that they are within specified tolerances.

10.3 Test Method—Each manhole cover assembly shall be designed to the pressure listed in Table 1 and Table 2 and tested to a pressure equal to 1.5 times the design pressure. The test pressure shall be held for a minimum of 5 min. There shall be no visible sign of leakage, permanent deformation, or other indications of structural failure of the manhole cover assembly.

10.3.1 Before delivery, the manhole cover assemblies shall be certified as to their watertight and oiltight integrity. Groups of manhole cover assemblies whose representative samples pass the tightness test shall be certified for watertight and oiltight integrity to their design pressure.

11. Product Marking

11.1 Each manhole cover assembly shall be marked with the purchase order number. Item number from purchase order, ASTM designation number, type, grade, class, and manufacturer’s name. Marking may be by paint, stencil, or weatherproof tag.

12. Packaging and Package Marking

12.1 Unless otherwise specified, packaging shall conform to the manufacturer’s normal commercial practice, and in such a manner that will ensure acceptance by common carrier and afford protection against physical damage during shipment. Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.
Note 1—See Table 1 for manhole cover assembly dimensions.
1 in. = 25.4 mm.

ANNEXES

(Mandatory Information)

A1. PACKING FOR DoD PROCUREMENTS (GOVERNMENT APPLICATION)

A1.1 Referenced Documents (for this annex only)

A1.1.1 Federal Standards:
- PPP-B-576 Box, Wood, Cleated, Veneer, Paper Overlaid\(^7\)
- PPP-B-585 Boxes, Wood, Wirebound\(^7\)
- PPP-B-591 Boxes, Fiberboard, Wood-Cleated\(^7\)
- PPP-B-601 Boxes, Wood, Cleated—Plywood\(^7\)
- PPP-B-621 Boxes, Wood, Nailed and Lock Corner\(^7\)
- PPP-B-636 Box, Fiberboard\(^7\)
- PPP-B-640 Boxes, Fiberboard, Corrugated, Triple, Wall\(^7\)

A1.1.2 Military Standards:
- MIL-STD-129 Marking for Shipment and Storage\(^4\)

A1.1.3 Official Classification Committee Standard:
- Uniform Freight Classification Rules\(^8\)

A1.2 Packing—The manhole cover assembly shall be cushioned, blocked, or braced within the container in a manner to prohibit movement. Unless otherwise specified in the order, one manhole cover assembly shall be packed per container. When more than one manhole cover assembly is required to be packed in each container, the gross mass of the wood or wood-cleated boxes shall not exceed approximately 100 kg.

A1.2.1 Level A—Manhole cover assembly shall be packed in containers conforming to any one of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification:</th>
<th>Type or Class:</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Overseas</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 3</td>
</tr>
</tbody>
</table>

A1.2.1.1 Boxes shall be closed and banded in accordance with the applicable box specification.

A1.2.2 Level B—Manhole cover assemblies shall be packed in boxes conforming to any of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification:</th>
<th>Type or Class:</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Domestic</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 1 or 2</td>
</tr>
<tr>
<td>PPP-B-591</td>
<td>Domestic</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Domestic</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 1</td>
</tr>
<tr>
<td>PPP-B-636</td>
<td>Domestic</td>
</tr>
<tr>
<td>PPP-B-640</td>
<td>Class 1</td>
</tr>
</tbody>
</table>

A1.2.2.1 Box closures shall be as specified in the applicable box specification. The gross mass of wood or wood-cleated boxes shall not exceed 100 kg.

A1.2.3 Level C—Packing shall be accomplished in a manner that will ensure acceptance by common carrier, at lowest rate, and will afford protection against physical or mechanical damage during direct shipment from the supply source to the using activity for early installation. The shipping containers or method of packing shall conform to the Uniform Freight Classification Rules and Regulations or other carrier regulations as applicable to the mode of transportation and may conform to the manufacturer’s commercial practice.

A1.3 Marking—In addition to any special marking required by the order, shipment shall be marked in accordance with MIL-STD-129.

A2. DoD MANHOLE COVER ASSEMBLY—SPECIAL APPLICATION

A2.1 Referenced Documents (for this annex only)

A2.1.1 Military Standards:
- MIL-C-6183 Cork and Rubber Composition Sheet for Aromatic Fuel and Oil Resistant Gaskets\(^7\)
- MIL-G-1149 Gasket Materials, Synthetic Rubber 50 and 65 Durometer Hardness\(^7\)
- MIL-R-900 Rubber Gasket Material as Durometer Hardness\(^7\)
- MIL-R-83248 Rubber Fluorocarbon Elastomer, High Temperature, Fluid and Compression Set Resistant\(^7\)

A2.2 Gasket materials used in DoD manhole cover assemblies shall be as follows:

<table>
<thead>
<tr>
<th>Manhole Cover Assembly Service:</th>
<th>Required Gasket Material:</th>
</tr>
</thead>
<tbody>
<tr>
<td>General service</td>
<td>MIL-R-900</td>
</tr>
<tr>
<td>Fresh water</td>
<td>MIL-G-1149, Class 2</td>
</tr>
<tr>
<td>Oil, gasoline, saltwater</td>
<td>MIL-C-6183, Class 1</td>
</tr>
<tr>
<td>Hydraulic machinery spaces using phosphate ester-based hydraulic fluid</td>
<td>MIL-R-83248</td>
</tr>
</tbody>
</table>

A2.3 DoD manhole covers shall be Class B.
1. Scope

1.1 This specification provides design and construction criteria for a semi-flush, oiltight and watertight bolted hinged manhole cover assembly.

1.2 The manhole cover assemblies depicted on this specification are for use in decks or bulkheads requiring oiltight and watertight covers that are not required to be completely flush. Manhole cover assemblies shall be complete with covers, mounting rings, gaskets, studs, washers, hinge assemblies, and nuts.

1.3 Handles, if required, shall be as specified in the ordering information.

1.4 Values stated in inch-pound units are to be regarded as standard.

1.5 This standard is not applicable to certain hazardous cargos. (See 46CFR 153.254 and 46CFR 154.340.)

1.6 This specification provides design and construction for manhole cover assemblies subjected to lateral pressures such as resulting from vehicle loads or hydrostatic pressures. Where manhole cover assemblies are subjected to primary or cyclic loads, other reinforcement or construction criteria may be necessary to integrate the manhole assembly with the required structural reinforcement for openings in decks or bulkheads. Design of the manhole cover assembly for primary or cyclic loads is beyond the scope of this specification.

2. Referenced Documents

2.1 ASTM Standards:
- A 36/A 36M Specification for Structural Steel
- A 131/A 131M Specification for Structural Steel for Ships
- A 153/A 153M Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware
- A 575 Specification for Steel Bars, Carbon, Merchant Quality, M-Grades
- B 36/B 36M Specification for Brass Plate, Sheet, Strip, and Rolled Bar
- D 2000 Classification System for Rubber Products in Automotive Applications
- F 783 Specification for Staple, Handgrab, Handle, and Stirrup Rung

2.2 ANSI Standards:
- B1.1 Unified Inch Screw Threads
- Y14.5M Dimensioning and Tolerancing
- B18.2.1 Square and Hex Bolts and Screws, Inch Series

2.3 ABS Standard:
- Rules for Building and Classing Steel Vessels

2.4 Steel Structures Painting Council Standard:
- SP-10 Surface Preparation Specification No. 10
- 2.5 Code of Federal Regulations Standard:
- CFR 46 Code of Federal Regulations

3. Terminology

3.1 Definitions:
3.1.1 manhole—accessway located in a tank structure.
3.1.2 semi-flush—refers to the placement of the hinged plate over the ringed opening (without coaming).

4. Classification

4.1 Type I—15- by 23-in. (381- by 584-mm) size of access opening
4.2 Type II—18- by 24-in. (457- by 610-mm) size of access opening
4.3 Grade 1—⅛-in. (6.4-mm) thick cover plate
4.4 Grade 2—⅜-in. (9.5-mm) thick cover plate

---

2 For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard’s Document Summary page on the ASTM website.

4 Available from American Bureau of Shipping (ABS), ABS Plaza, 16855 Northchase Dr., Houston, TX 77060.

5 Available from Steel Structures Painting Council (SSPC), 40 24th St., 6th Floor, Pittsburgh, PA 15222-4656.

4.5 Grade 3—½-in. (12.7-mm) thick cover plate
4.6 Class A Manhole Cover Assemblies—Shall be abrasive blasted to near white metal in accordance with SSPC SP-10 and a commercial marine quality nonhazardous corrosion-inhibiting and oil-resistant primer coating be applied for protection for a period of one year during shipping and in shipyard handling.

4.7 Class B Manhole Cover Assemblies—Shall be galvanized in accordance with Specification A 153.

5. Ordering Information

5.1 The purchasers ordering information shall include the following:

5.1.1 ASTM designation and date.
5.1.2 Type (see 4.1 and 4.2).
5.1.3 Grade (see 4.3, 4.4, and 4.5).
5.1.4 Class see (4.6 and 4.7).
5.1.5 Quantity.
5.1.6 Remarks—Handles (are/are not) required.
5.1.7 Approval—Classification society approval (is/is not) required.
5.1.8 Gasket, if other than specified (see 6.8).

6. Materials and Manufacture

6.1 Plate for the cover, ring, hinge pad and hinge blade shall be in accordance with Specification A 36/A 36M or A 131/A 131M steel.
6.2 Round bar for the handle shall be in accordance with Specification F 783, Type A.
6.3 Round bar for the hinge pin shall be of Specification A 575 steel.
6.4 Welded studs shall be ¾ in. (19.1 mm)—10 UNC-2A by 1¾ in. (44.5 mm) long and manufactured of ordinary steel to commercial standards. Threads shall be the coarse thread series in accordance with the latest issue of ANSI B1.1.
6.5 Washers shall be ANSI B18.2.1 Type A, ¾-in. (19.1-mm) washer, 2-in. (50.8-mm) by 0.148-in. (3.8-mm) thick standard flat manufactured of yellow brass, in accordance with Specification B 36/B 36M.
6.6 Heavy hex nuts shall be ¾ in. (19.1 mm)—10 UNC-2B and manufactured of yellow brass, in accordance with Specification B 36/B 36M. Threads in nuts shall conform to the dimensions for coarse threads with tolerances prescribed in accordance with ANSI B1.1. The nuts shall conform to dimensions prescribed in accordance with ANSI B18.2.1.
6.7 Cotter pin to be in accordance with Specification B 36/B 36M yellow brass, ½ by 1¾ in. (3.2 by 44.5 mm) long.

6.8 Unless otherwise specified in ordering information, gasket to be rubber, ¾ in. (4.8 mm) thick, 50 ± 5 durometers per Classification D 2000 5BC07 A14 E034. For manhole cover assemblies for government application, see Annex A2 for type of gasket.
6.9 Welding to conform to the latest issue of American Bureau of Shipping Rules or other such classification society rules as may be applicable.
6.10 Details of bolted manholes are shown in Fig. 1.

7. Dimensions

7.1 Dimensions of manhole shall be as indicated in Table 1.
manner that will ensure acceptance by common carrier and afford protection against physical damage during shipment.

Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.

**FIG. 1 Manhole Cover Assembly, Bolted, Hinged, Semi-Flush, Oiltight and Watertight.**
12.2 For government procurements for long-term storage or overseas shipment, the requirements of Annex A1 apply. In such case, the required level of packaging shall be specified.

13. Keywords

13.1 bulkhead; decks; manhole cover; manhole cover assembly; marine technology; ships
### TABLE 1 Dimensions for Bolted, Hinged, Semi-Flush, Oiltight and Watertight Manhole Cover Assembly

**NOTE 1—1 in. = 25.4 mm.**

| Type | Grade | Plate Thickness | Deck Cut Overall Size | A | B | C | D | E | F | G | H | I | J | K |
|------|-------|-----------------|-----------------------|---|---|---|---|---|---|---|---|---|---|---|---|

A The letters in the headings designate the following:

A = number of spaces on straight side,

B = bolt spacing (straight side),

C = total span,

D = number of spaces on arc side,

E = bolt spacing (arc side),

F = arc span,

G = accessway inner radius,

H = seat and gasket inner radius,

I = bolt circle arc radius,

J = seat and gasket outer radius,

K = offset for radii from center of accessway and cover,

L = distance from centerline of cover to centerline of hinge blade, and

M = distance from centerline of cover to centerline of hinge pad.
A1. PACKING FOR DoD PROCUREMENTS

A1.1 Referenced Documents

A1.1.1 Federal Specifications:
- PPP-B-576—Box, wood, cleated, veneer, paper overlaid.
- PPP-B-585—Boxes, wood, wirebound.
- PPP-B-591—Boxes, fiberboard, wood-cleated.
- PPP-B-601—Boxes, wood, cleated-plywood.
- PPP-B-621—Boxes, wood, nailed and lock corner.
- PPP-B-636—Box, fiberboard.
- PPP-B-640—Boxes, fiberboard, corrugated, triple, wall.

A1.1.2 Military Standard:
- MIL-STD-129—Marking for shipment and storage

A1.1.3 Official Classification Committee Rules:
- Uniform Freight Classification Rules

A1.2 Preservation

A1.2.1 None required.

A1.3 Packing

A1.3.1 The manhole cover assembly shall be cushioned, blocked, or braced within the container in a manner to prohibit movement. Unless otherwise specified in the order, one manhole cover assembly shall be packed per container. When more than one manhole cover assembly is required to be packed in each container, the gross mass of the wood or wood-cleated boxes shall not exceed approximately 100 kg.

A1.3.2 Level A

Manhole cover assembly shall be packed in containers conforming to any of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>
<td>Overseas</td>
</tr>
<tr>
<td>PPP-B-585</td>
<td>Class 3</td>
</tr>
<tr>
<td>PPP-B-591</td>
<td>Overseas</td>
</tr>
<tr>
<td>PPP-B-601</td>
<td>Overseas</td>
</tr>
<tr>
<td>PPP-B-621</td>
<td>Class 2</td>
</tr>
</tbody>
</table>

Box closures shall be as specified in the applicable box specification. The gross mass of wood or wood-cleated boxes shall not exceed 100 kg.

A1.3.3 Level B

Manhole cover assemblies shall be packed in boxes conforming to any of the following specifications at the option of the manufacturer:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Type or Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP-B-576</td>

<td>Class 1</td>
</tr>
</tbody>
</table>

A1.3.4 Level C

Packing shall be accomplished in a manner that will ensure acceptance by common carrier, at lowest rate, and will afford protection against physical or mechanical damage during direct shipment from the supply source to the using activity for early installation. The shipping containers or method of packing shall conform to the uniform freight classification rules and regulations or other carrier regulations as applicable to the mode of transportation and may conform to the manufacturer’s commercial practice.

A1.4 Marking

A1.4.1 In addition to any special marking required by the order, shipment shall be marked in accordance with MIL-STD-129.

A2. DoD MANHOLE COVER ASSEMBLY SPECIAL APPLICATION

A2.1 Referenced Documents (for this annex only)

A2.1.1 Military Standards:
- MIL-C-6183 Cork and Rubber Composition Sheet for Aromatic Fuel and Oil Resistant Gaskets

MIL-G-1149 Gasket Materials, Synthetic Rubber 50 and 65 Durometer Hardness
MIL-R-900 Rubber Gasket Material 45 Durometer Hardness
MIL-R-83248 Rubber Fluorocarbon Elastomer, High Temperature, Fluid and Compression Set Resistant

7 Available from Standardization Documents, Order Desk, Bldg. 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, Attn: NPODS.
A2.2 Gasket materials used in DoD manhole cover assemblies shall be as follows:

<table>

</table>

Manhole Cover Assembly Service:
- Hydraulic machinery spaces using phosphate ester-based hydraulic fluid
- MIL-R-83248

A2.2 DoD manhole covers shall be Class B.
Designation: F 1145 – 92 (Reapproved 2001)

An American National Standard

Standard Specification for
Turnbuckles, Swaged, Welded, Forged

This standard is issued under the fixed designation F 1145; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers swaged welded, cast, or forged turnbuckles with and without jam nuts.

1.2 A turnbuckle is an internally threaded loop or sleeve intended for assembly with a threaded stud, eye, hook, or jaw at each end, used for applying tension to rods, wire rope, etc.

1.3 The values stated in inch-pound units are to be regarded as standard. The SI units given in parentheses are for information purposes only and may be approximate.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
A 29 Specification for Steel Bars, Carbon and Alloy, Hot-Wrought and Cold-Finished, General Requirements for
A 153/A 153M Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
B 633 Specification for Electrodeposited Coatings of Zinc on Iron and Steel
D 3951 Practice for Commercial Packaging
2.2 AWS Standards:
A5.1 Covered Carbon Steel Arc Welding Electrodes
A5.2 Iron and Steel Oxyfuel Gas Welding Rods
A5.5 Low Alloy Steel Covered Arc Welding Electrodes
2.3 ANSI Standards:
B1.1 Unified Inch Screw Threads (UN and UNR Thread Form)

B18.2.2 Square and Hex Nuts
2.4 Military Standards:
MIL-STD-1186 Cushioning, Anchoring, Bracing, Blocking, and Waterproofing; with Appropriate Test Methods
MIL-STD-2073-1 DoD Material Procedures for Development and Application of Packaging Requirements
2.5 Military Specification:
MIL-P-116 Preservation, Methods of
MIL-L-19140 Lumber and Plywood, Fire-Retardant Treated
2.6 Federal Specifications:
PPP-B-636 Boxes, Shipping, Fiberboard
PPP-F-320 Fiberboard: Corrugated and Solid Sheet Stock (Container Grade) and Cut Shapes
2.7 Federal Standard:
FED-STD-123 Marking for Shipment (Civil Agencies)

3. Classification

3.1 Turnbuckles covered under this specification shall be of the following types and grades, as specified (see 4.1.3 and 4.1.7):

3.1.1 Type I—Open turnbuckle bodies (see 5.2.4–5.2.7)
Grade
1 Forged
2 Spread
3 Resistance welded
4 Arc or gas welded
3.1.2 Type II—Pipe turnbuckle bodies (see 5.2.8).
3.1.3 Type III—Rigging turnbuckle bodies (see 5.2.9).
3.2 Turnbuckles covered under this specification shall be of the following classes and sizes, as specified (see 4.1.3):

3.2.1 Classes:
A—turnbuckle, body only without end pulls, heads not drilled.
B—turnbuckle, body only without end pulls, heads threaded right and left hand.
C—turnbuckle with stub and stub end pulls, complete.
D—turnbuckle with eye and eye end pulls, complete.
E—turnbuckle with hook and hook end pulls, complete.
F—turnbuckle with hook and eye end pulls, complete.
G—turnbuckle with jaw and jaw end pulls, complete.

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Shipbuilding and is the direct responsibility of Subcommittee F25.07 on General Requirements.
2 Annual Book of ASTM Standards, Vol 01.05.
3 Annual Book of ASTM Standards, Vol 01.06.
4 Annual Book of ASTM Standards, Vol 02.05.
6 Available from American Welding Society, 550 NW LeJeune Road, Miami, FL 33126.
7 Available from American National Standards Institute, 25 W. 43rd St., 4th Floor, New York, NY 10036.
8 Available from Standardization Documents Order Desk, Bldg. 4 Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, Attn: NPODS.
H—turnbuckle with jaw and eye end pulls, complete.

3.2.1.1 The arrangement of turnbuckle bodies and end pulls for Classes C, D, E, F, G, and H shall be similar to Fig. 1.

3.2.2 Sizes—Shall be as listed in Table 1 and Table 2.

4. Ordering Information

4.1 Orders for material under this specification shall include the following information:

4.1.1 ASTM designation and year of issue,
4.1.2 Quantity required,
4.1.3 Type, class, and size (see 3.1, 3.2, and 8.1),
4.1.4 Material, if different (see 5.1.1),
4.1.5 Type thread required (see 7.3),
4.1.6 Type finish required (see 9.3),
4.1.7 Grade required, if Type I is specified (see 3.1.1),
4.1.8 Optional requirements, if any (see S1 and S2).

5. Materials and Manufacture

5.1 Materials:

5.1.1 Unless otherwise specified (see 4.1.4), turnbuckle and end pulls shall be made from steel of a grade which will meet the requirements of Table 3.

5.1.2 For materials used for welded turnbuckle bodies, eye and jaw end pulls, the carbon shall be 0.25 % maximum, sulfur 0.05 % maximum, and phosphorus 0.05 % maximum.

5.2 Manufacture:

5.2.1 Eye End Pulls—Eye end pulls shall be forged, resistance welded, or arc or gas welded, at the option of the
producer, except that when forged bodies are specified, forged-eye end pulls shall be required.

5.2.1.1 Each forged-eye end pull shall be forged at elevated temperature to final shape and size and shall be similar to Fig. 2. The shape of the eye may be either oval or round.

5.2.1.2 Resistance-welded eye end pulls shall be similar to Fig. 3. They shall be fabricated from one piece of material by bending the material to form the eye and joined by resistance welding process.

5.2.1.3 Arc- or gas-welded eye end pulls shall be similar to Fig. 4. They shall be fabricated from one piece of material by bending the material to form the eye and joined by welding. The cross-sectional area through the weld shall be not less than the cross-sectional area of the bar.

5.2.2 Jaw End Pulls—Jaw end pulls shall be forged, arc or gas welded, or upset, at the option of the producer, except that if forged bodies are specified, forged-jaw end pulls shall be provided.
5.2.2.1 Forged-jaw end pulls shall be similar to Fig. 5.

5.2.2.2 Arc- or gas-welded end pulls shall be similar to Fig. 6.

5.2.2.3 Upset jaw end pulls shall be similar to Fig. 7.

5.2.3 Hook End Pulls—Hook end pulls shall be forged and be similar to Fig. 8.

5.2.4 Type I, Grade 1 Turnbuckles—Each forged turnbuckle body shall be forged at elevated temperature to final shape and size and shall be similar to Fig. 9. The shape of the head of the turnbuckle shall be either round or hexagonal.

5.2.5 Type I, Grade 2 Turnbuckles—For each spread turnbuckle body, one piece of material shall be cut lengthwise from near one end to the other end by any suitable means, such as an oxyacetylene cutting torch; the resulting reins shall then be spread apart at elevated temperatures to final shape and size. The bodies shall be similar to Fig. 10. The shape of the cross section of the material shall be at the option of the producer.

5.2.6 Type I, Grade 3 Turnbuckles—Each resistance-welded turnbuckle body shall be fabricated by joining two formed pieces of material by either the flash or upset welding process. The welds shall be parallel to the long axis of the piece. The surfaces to be joined shall be held in intimate contact by external forces, an electric current passed through the surfaces, and the weld consolidated by the forces. The bodies shall be similar to Fig. 11. The shape of the cross section of the pieces shall be at the option of the producer.

5.2.7 Type I, Grade 4 Turnbuckles—The welds shall be either electric arc or oxyacetylene (gas) at the option of the producer. Arc- or gas-welded turnbuckle bodies shall be fabricated by joining four pieces of material by welds similar to Fig. 12. The faces of the welds shall not be concave but may be somewhat convex.

5.2.8 Type II, Pipe—Pipe turnbuckle bodies shall be forged, swaged, spun, drawn, or upset in way of the threaded ends, and shall be similar to Fig. 13.

5.2.9 Type III, Rigging—Rigging turnbuckle bodies shall be forged, similar to Fig. 14, and shall be provided with a heavy jam nut (see 5.1.3) of a type which does not depend upon deformation of the threads for security.

6. Mechanical Properties

6.1 The breaking strength of turnbuckles, equipped with end pulls, shall be not less than the value given in Table 3 for the required size, type, and grade of end pull specified.

6.2 End pulls shall be capable of bending through an angle of 90° around a pin twice the nominal major diameter of the end pull without either crack or rupture.
6.3 End pulls for Classes D, E, F, G, and H shall be capable of supporting a load equal to one half of the specified breaking strength without permanent deformation.

7. Other Requirements

7.1 All arc-welded bodies, eyes, and jaws shall be welded with Type 7015, 7016, 8015, or 8016 electrodes of AWS A 5.1 or AWS A 5.5, as applicable.

7.2 All gas-welded bodies, eyes, and jaws shall be welded with welding rods in accordance with AWS A 5.2.

7.3 Turnbuckle bodies and end pulls shall be threaded after fabrication to final size and shape. The threads in the heads of the turnbuckle bodies and on the end pulls shall comply with ANSI B 1.1 (see 4.1.5). Unified threads in the coarse (UNC) and fine (UNF) standard series should be used. If neither is specified, the threads will be in the UNC series. If the standard diameter-pitch combinations are not suitable, the UNS threads with dimensions in accordance with ANSI B 1.1 should be used.

7.3.1 Threads on the finished turnbuckle shall not be looser than class 1A/1B fit. If coated turnbuckles are specified, the male threads on the end pulls may be undercut, as necessary, so that after coating they will properly mate (not looser than 1A/1B fit) with the standard size female threads of the turnbuckle bodies.

7.3.2 The thread in one head of each turnbuckle body shall be right-hand and in the other head, left-hand.

7.3.3 The threads on the end pulls shall be right-hand on one end pull and left-hand on the other. The length of the thread on the two end pulls shall be great enough so that the ends of the end pull can be brought into contact with each other at the middle of the body length when jam nuts are not used.

8. Dimensions and Tolerances

8.1 Turnbuckles covered by this specification shall be furnished in the sizes shown in Table 1 and Table 2, as specified (see 4.1.3).
8.1.1 The size of turnbuckle bodies and turnbuckles shall be the nominal major diameter of the threads in the heads and the clear opening between heads (which is approximately equal to the take up); thus, for a ¾ by 6-in. (19 by 152-mm) turnbuckle body, the heads shall be threaded for a ¾-in. (19-mm) nominal major diameter end pull, and the clear opening between heads shall be 6 in. (152 mm). The difference between the actual clear opening in the turnbuckle body and the nominal value given in Table 1 or 2 for the size specified shall not exceed 5 % of the nominal value.

8.1.2 The lengths of the heads of the turnbuckle bodies shall not be less than 1 ½ times the nominal outside diameter of the end pull for sizes up to 1 ¼ in. (32 mm), and 1 ¼ times for sizes 1 ½ in. (32 mm) and above.

8.2 Type I, Grade 4 turnbuckle bodies shall comply with the dimensional requirements given in Table 4 for the size specified.

8.3 For Types II and III turnbuckle bodies, holes in body shall be ¼ in. (6 mm) in diameter for sizes up to and including ½ in. (16 mm); holes in body for sizes larger than ½ in. (16 mm) shall be ½ in. (13 mm) in diameter (see Fig. 13 and Fig. 14, respectively).

8.4 Minimum dimensions for forged-eye end pulls are as shown in Table 5.

8.5 For arc- or gas-welded and resistance-welded eye end pulls, the outside diameter of the eye shall not be less than 3 ½ times the nominal diameter of the end pull. Nominal dimensions “D” and “B” (see Fig. 3 and Fig. 4) shall be in accordance with Table 5.

8.6 Forged-jaw end pulls shall comply with the dimensional requirements of Table 6.

8.6.1 In Fig. 5, the area of the cross section X-X shall be not less than 0.75 of the area corresponding to the nominal diameter. The area of the cross section Y-Y shall be not less than 0.40 of the area corresponding to the nominal diameter.

8.7 Arc- or gas-welded jaw end pulls shall comply with the dimensional requirements of Table 7.

8.7.1 In Fig. 6, the area of the cross section X-X shall be not less than 0.75 of the area corresponding to the nominal diameter. The area of the cross section Y-Y shall be not less than 0.40 of the area corresponding to the nominal diameter.

8.8 Upset jaw ends shall comply with the dimensional requirements of Table 8.

8.8.1 In Fig. 7, the area of the cross section X-X shall be not less than 0.75 of the area corresponding to the nominal diameter. The area of the cross section Y-Y shall be not less than 0.40 of the area corresponding to the nominal diameter.

8.9 Hook end pulls shall comply with the dimensional requirements of Table 9.

8.10 Heavy jam nuts (see 5.1.3) shall conform to the dimensional requirements in accordance with ANSI B 18.2.2.

9. Workmanship, Finish, and Appearance

9.1 Turnbuckles and end pulls shall be finished in a workmanlike manner. All parts shall be properly shaped and shall be free from fins, cracks, flaws, seams, and other injurious defects.

9.1.1 Screw threads shall be true to form, clean cut, and free from injurious defects.

9.2 Turnbuckles and end pulls shall be finished by grinding the flash and excess weld metal smooth, where required, and the loose scale removed.

9.3 Turnbuckles shall be furnished self-colored, black, or zinc-coated, as specified (see 4.1.6).

9.3.1 If zinc-coated turnbuckles are specified, the coating may be applied by the hot-dip (galvanizing) process or the electrodeposition process at the manufacturer’s option.

9.3.1.1 If the hot-dip process is used, the coating shall be applied in accordance with Specification A 153 and shall be adherent, smooth, and free from injurious lumps, blisters, dross, or flux.

9.3.1.2 If the electrodeposition process is used, it shall conform to Type II finish, Class Fe/Zn 12 in accordance with Specification B 633.

9.3.2 Coating shall be done on the end pulls after threading; coating for turnbuckle bodies shall be done after tapping.
10. Sampling

10.1 All turnbuckles of the same type, grade, class, and size, not exceeding 1000 and presented at one time, shall be considered a lot.

10.2 A random sample of turnbuckles shall be selected from each lot in accordance with Table 10 for the examination specified in 12.2.

10.3 A random sample of turnbuckles shall be selected from each lot in accordance with Table 11 for the breaking strength, proof, bending, and galvanizing tests specified in Section 11.

10.3.1 End pull samples for bending tests shall be selected prior to threading.

10.3.2 Failure of any sample in any test shall be cause for rejection of the lot represented by the sample.

10.3.3 Specimens used for the breaking strength and bend tests may also be used for the galvanizing tests.

11. Test Methods

11.1 Proof Test—Each sample selected in accordance with 10.3 shall be subjected to a proof test of one half the specified breaking strength (see Table 1) for the end pull. Test loads shall be applied at end pulls.

11.2 Breaking Strength Test—Each sample turnbuckle selected in accordance with 10.3 shall be tested to failure. Loads shall be applied at end pulls.

11.3 Bending Test—Each end pull sample selected in accordance with 10.3 shall be bent cold through an angle of 90° around a pin twice the nominal diameter of the end pull.

11.4 Galvanizing Test—If the hot-dip zinc-coating method is used, no thickness test will be required. If the electrodeposition method is used, the thickness shall be determined as specified in Specification B 633.

11.5 Possible test failures are defined as follows:

11.5.1 Proof Test—Evidence of deformation or signs of incipient cracks in turnbuckle body or end pull as a result of specified proof test.

11.5.2 Breaking Strength Test—Breaking strength or turnbuckles equipped with end pulls less than the required minimum value.

11.5.3 Bending Test—Evidence of cracks or rupture when the unthreaded end pull is bent cold as required.

11.5.4 Galvanizing Test—Coating nonconformant; nonadherent, evidence of coat flaking off, or separating from basic metal; thickness less than the allowable minimum.

12. Inspection

12.1 The purchaser reserves the right to perform any of the inspections set forth in the specification where such inspections are deemed necessary to ensure that supplies and services conform to prescribed requirements.

12.2 Each sample turnbuckle selected in accordance with Table 10 shall be examined to verify compliance with the requirements of this specification. Examination shall be conducted as specified in Table 12.

12.2.1 Any turnbuckle in the sample containing one or more defects shall be rejected. If any defects are noted in the original sample units, an additional sample quantity, in accordance with Table 10, shall be randomly selected; and if any defects are noted as specified in Table 12, this shall be cause for rejection of the lot represented by that sample.

13. Rejection and Rehearing

13.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the producer or supplier may make claim for a rehearing.

14. Packaging and Package Marking

14.1 Unless otherwise specified (see 4.1.8), packaging shall conform to the manufacturer’s normal commercial practice, and in such a manner that will ensure acceptance by common carrier and afford protection against physical and mechanical damage during shipment. Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only for direct government acquisition, when specified in the contract or order (see 4.1.8).

S1. General

S1.1 Navy Fire-Retardant Requirements:

S1.1.1 Treated Lumber and Plywood—When specified, all lumber and plywood including laminated veneer material used in shipping container and pallet construction, members, blocking, bracing, and reinforcing shall be fire-retardant treated material conforming to MIL-L-19140 as follows:

<table>
<thead>
<tr>
<th>Levels</th>
<th>Weather Resistant: Category I—General Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>A and B</td>
<td>Type II</td>
</tr>
<tr>
<td>C</td>
<td>Type I</td>
</tr>
<tr>
<td></td>
<td>Non-Weather Resistant: Category I—General Use</td>
</tr>
</tbody>
</table>

S1.1.2 Fiberboard—Fiberboard used in the construction of interior (unit and intermediate) and exterior fiberboard boxes, including interior packaging forms shall conform to the class domestic/fire retaradant or class weather resistant/fire retardant materials requirements as specified in PPP-F-320 and amendments thereto.

S1.1.3 Cushioning and Wrapping Materials—The use of excelsior, newspaper, shredded paper (all types), and similar hydroscopic or non-neutral materials and all types of loose fill materials for packaging applications such as cushioning, fill, stuffing, and dunnage is prohibited. Material selected for cushioning and wrapping shall have properties (characteristics) for resistance to fire. Cushioning or wrapping materials, as applicable, shall be provided to prevent item and package damage and to prevent free movement of the container contents.

S2. Preservation

S2.1 Preservation shall be Level A or commercial as specified.

S2.1.1 Level A—Turnbuckles except black coated and zinc coated, shall be preserved in accordance with Method I of MIL-P-116, using type P-1 or P-19 preservative. Black coated or zinc coated turnbuckles shall be preserved in accordance with Method III of MIL-P-116.

S2.1.1.1 Turnbuckles with a mass less than 5 lb (2.5 kg) each shall be packed in fiberboard boxes conforming to PPP-B-636, class weather resistant. Box closure shall conform to Method V as specified in the applicable box specification appendix. The gross mass of the boxes shall not exceed the limitations of the applicable box specification.

S2.1.1.2 Turnbuckles with a mass over 5 lb (2.5 kg) each shall be bulk packed in containers specified in Section S3.

S2.2 Commercial—Turnbuckles shall be preserved in accordance with Practice D 3951.

S3. Packing

S3.1 Packing shall be level A, B, or commercial as specified.

S3.1.1 General Requirements for Levels A, B, and C—Containers selected (see S3.1.2) shall be of minimum mass and cube consistent with the protection required, of uniform size, and contain identical quantities.

S3.1.2 Levels A, B, and C—Turnbuckles preserved as specified, shall be packed in exterior shipping containers in accordance with MIL-STD-2073-1, Table VII of Appendix C, for the level of packing specified. Unless otherwise specified container selection including container options shall be the contractor’s option.

S3.1.2.1 Closure, Gross Mass, and Waterproofing:

1. Closure—Container closure, reinforcing, or banding shall be in accordance with container specification or appendix thereto except that weather resistant fiberboard boxes shall be closed in accordance with Method V and reinforced with non-metallic or tape banding and domestic nonweather-resistant fiberboard boxes shall be closed in accordance with Method I using pressure-sensitive tape.

2. Mass—Wood, plywood, and wood cleated type containers whose mass exceeds 200 lb (90 kg) shall be modified by the addition of skids in accordance with MIL-STD-2073-1, Appendix F or the applicable container specification or appendix thereto.

3. Waterproofing—Unless otherwise specified, Level A and when specified Level B shipping containers shall be provided with case liners, linings, wraps, or shrouds in accordance with MIL-STD-1186.

S3.1.3 Commercial—Turnbuckles preserved as specified shall be packed for shipment in accordance with Practice D 3951 and herein.

S3.1.3.1 Container Modification—Shipping containers with mass exceeding 200 lb (90 kg) shall be provided with a minimum of two 3 by 4 in. (75 by100 mm) nominal wood skids laid flat, or a skid or sill-type base which will support the material and facilitate handling by mechanical handling equipment during shipment, stowage and storage.

S4. Palletized Unit Loads

S4.1 When specified, containers shall be palletized in accordance with MIL-STD 2073-1, Appendix F.
S5. Marking

S5.1 Levels A, B, C, and Commercial—In addition to any special marking required, interior (unit) packs, shipping containers, and palletized unit loads shall be marked in accordance with MIL-STD 2073-1, Appendix F for military agencies and FED-STD 123 for civil agencies and shall include bar codes and applicable packaging acquisition options herein as specified.
Standard Practice for Selection and Application of Piping System Materials\textsuperscript{1}

This standard is issued under the fixed designation F 1155; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (\(\varepsilon\)) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice is intended as a guide to shipbuilders, shipowners, and design agents for use in the preparation of piping system material schedules for commercial ship design and construction.

1.2 The materials and limitations listed in Tables 1-28 meet the minimum requirements of the U.S. Coast Guard and the American Bureau of Shipping and should be considered to be the minimum acceptable materials in regard to material, design, and testing. This document is not intended to limit the selection of material strictly to those listed. Other equal or superior materials may be used provided that they are acceptable to the regulatory bodies and classification societies.

2. Referenced Documents

B 18.2.2 Square and Hex Nuts (Inch Series)
B 31.1 Power Piping
B 36.10 Welded and Seamless Wrought Steel Pipe
B 36.19 Stainless Steel Pipe

2.3 Manufacturer’s Standardization Society of the Valve and Fitting Industry Standards:
SP-67 Butterfly Valves
SP-72 Ball Valves with Flanged or Butt-Welding Ends for General Service
SP-80 Bronze Gate, Globe, Angle and Check Valves

F 1155 – 98

3. General Requirements

3.1 Shipboard piping systems shall be in accordance with ANSI B31.1 except as modified by 46 CFR Part 56 of the U.S. Coast Guard regulations and Sections 36 and 44 of the ABS’ Rules.

3.2 Piping systems shall be classed in accordance with 46 CFR 56.04.

3.3 Valves shall be in accordance with 46 CFR 56.20.

3.4 Valves for Class I systems shall be in accordance with 46 CFR 56.20-9(b) and if larger than 2-in. NPS shall not have socket weld ends.

3.5 Resilient seated valves shall be in accordance with 46 CFR 56.20-15.

3.6 Dimensions of ductile iron gate, globe, angle, and check valves shall be in accordance with ANSI B16.34 and shall use the adjusted pressure temperature ratings of ANSI B31.1, Appendix E.

3.7 Flanges for flanged valves and fittings and their companion flanges shall be in accordance with 46 CFR 56.25 and 56.30-10.

3.8 Bolting shall be in accordance with 46 CFR 56.25-20. Practice F 704 shall be used as a guide for determining flange bolting lengths.

3.9 Socket weld joints shall be in accordance with 46 CFR 56.30-5(c) and 56.30-10(b), Method 4, and shall not exceed 3-in. NPS for Class I and II-L service.

3.10 Threaded joints shall be in accordance with 46 CFR 56.30-20 and shall not exceed 2-in. NPS for Class I systems.

3.11 Flared, flareless, and compression tube fittings shall be limited to 2-in. OD or below and shall be in accordance with 46 CFR 56.30-25.3.12

3.12 Brazed socket type joints shall be in accordance with 46 CFR 56.30-30 and 56.75.

3.13 Gasketed mechanical couplings and fittings for use with gasketed mechanical couplings shall be in accordance with 46 CFR 56.30-35.

3.14 Flexible pipe couplings of the compression or slip-on types shall be in accordance with 46 CFR 56.30-40.

3.15 For restrictions on the use of welded tube and pipe, see 46 CFR 56.60-2(b).

10 Available from Manufacturer’s Standardization Society of the Valve and Fittings Industry, 127 Park St., N.E. Vienna, VA 22180.
11 Available from American Society of Mechanical Engineers, 345 E. 47th St., New York, NY 10017.
12 Available from American Bureau of Shipping, Book Order, 45 Eisenhower Dr., Paramus, NJ 07652.
3.16 Ferrous pipe used for saltwater service shall be protected against corrosion in accordance with 46 CFR 56.60-3(a).
3.17 All welding of Class I and II piping shall be in accordance with 46 CFR 56.70 and Specification F 722.
3.18 Thermal insulation for piping systems shall be in accordance with Practice F 683.
3.19 Fiberglass reinforced thermosetting epoxy resin pipe and fittings shall be in accordance with 46 CFR 56.60-25 and U.S. Coast Guard Navigation and Vessel Inspection Circular (NVIC) 11-86.
3.20 Fiberglass pipe shall not be used outboard of skin valves.

---

**Footnotes**:
- When combining dissimilar materials, galvanic corrosion can occur, especially in seawater systems, and should be considered.
- CNA—copper nickel alloy.
- FGP—fiberglass pipe.
- GRP—grade.
- Specific Coast Guard and ABS approval required.
- For U.S. flag vessels in addition to classification society requirements.
- GRP—glass reinforced plastic.
- Acceptable when gasket isolates coupling housings from fluid.
- Not permitted with CNA piping.
- Trim group definition, refer to Table 28.
- MSS-SP-80 valves limited to 75 % of valve design pressure.

<sup>D</sup>Gr—grade.

<sup>E</sup>CrMo—chromium-molybdenum.

<sup>F</sup>NCA—nickel copper alloy.

<sup>G</sup>Discontinued.
1. Scope

1.1 This practice establishes general human engineering design criteria for marine vessels, and systems, subsystems, and equipment contained therein. It provides a useful tool for the designer to incorporate human capabilities into a design.

1.2 The purpose of this practice is to present human engineering design criteria, principles, and practices to achieve mission success through integration of the human into the vessel system, subsystem, and equipment with the goals of effectiveness, simplicity, efficiency, reliability, and safety for operation, training, and maintenance.

1.3 This practice applies to the design of vessels, systems, subsystems, and equipment. Nothing in this practice shall be construed as limiting the selection of hardware, materials, or processes to the specific items described herein. Unless otherwise stated in specific provisions, this practice is applicable to design of vessel systems, subsystems, and equipment for use by both men and women.

1.4 Copies of specifications, standards, drawings, and publications required by contractors in connection with specific procurement functions should be obtained from the procuring activity or as directed by the contracting officer.

1.5 This practice is not intended to be a criterion for limiting use of material already in the field in areas such as lift repetition or temperature exposure time.

1.6 Force Limits—If it is known that an item is to be used by an already established occupational specialty, for which physical qualification requirements for entry into that specialty are also established, any discrepancy between the force criteria of this practice and the physical qualification requirements shall be resolved in favor of the latter. In this event, the least stringent physical qualification requirement of all specialties which may operate, maintain, transport, supply, move, lift, or otherwise manipulate the item, in the manner being considered, is selected as a maximum design force limit.

1.7 Manufacturing Tolerances—When manufacturing tolerances are not perceptible to the user, this practice shall not be construed as preventing the use of components whose dimensions are within a normal manufacturing upper or lower limit tolerance of the dimensions specified herein.

1.8 This practice is divided into the following sections:

### 3. Terminology

#### 3.1 Definitions of Terms Specific to This Standard:

##### 3.1.1 abort—a capability that cancels all user entries in a defined transaction sequence.

##### 3.1.2 accessible—unless otherwise specified herein or where specific design values are given, an item is considered accessible only where it can be operated, manipulated, removed, or replaced by the suitably clothed and equipped user with applicable fifth and ninety-fifth percentile body dimensions. Applicable body dimensions are those dimensions that are design critical to the operation, manipulation, removal, or replacement task. For example, an adjustment control behind an access opening should be located sufficiently close to the aperture to enable a suitably clothed and equipped user with a fifth percentile depth of reach to grasp and manipulate the adjustment control, while the opening should be sufficiently large to enable passage of a similarly clothed and equipped ninety-fifth percentile hand and arm.

##### 3.1.3 advisory signal—a signal that indicates safe or normal configuration, condition of performance, operation of essential equipment, or that attracts attention and imparts information for routine action purposes.

##### 3.1.4 angle of incidence—the angle between the line of direction of anything (such as a ray of light or line of sight) striking a surface and a line perpendicular to that surface drawn to the point of contact as shown in Fig. 1.

---

---

3.1.5 **backup**—a capability that returns a user to the last previous display in a defined transaction sequence. Also refers to the practice of preserving a second copy of files for data protection purposes.

3.1.6 **brightness**—the amount of emitted or reflected light visible to the eye.

3.1.7 **cancel**—a capability that regenerates or reinitializes the current display without processing or retaining any changes made by the user.

3.1.8 **caution signal**—a signal that alerts the operator to an impending hazardous condition requiring attention, but not necessarily immediate action.

3.1.9 **command and control system equipment**—the main mission element equipment and related ground equipment used in collecting, transmitting, processing, and displaying information for command and control.

3.1.10 **command language**—a type of dialogue in which a user composes control entries with minimal prompting by the computer.

3.1.11 **common hand tools**—items of tools found in common usage or applicable to a variety of operations or to a single operation on a variety of material. Screwdrivers, hammers, and wrenches are examples of common hand tools.

3.1.12 **control entry**—user input for sequence control, such as function key actuation, menu selection, command entry, and so forth.

3.1.13 **data**—the raw materials from which a user extracts information. Data may include numbers, words, pictures, and so forth.

3.1.14 **data display**—output of data from a computer to its users. Generally, the phrase denotes visual output, but it may be qualified to indicate a different modality, such as “auditory display.”

3.1.15 **data entry**—user input of data for computer processing and computer responses to such inputs.

3.1.16 **data field**—an area of the display screen reserved for user entry of a data item.

3.1.17 **data item**—a set of characters of fixed or variable length that forms a single unit of data. Examples of a data item might be a person’s name or a zip code. Data items may be entered by a user or may be supplied by the computer.

3.1.18 **data protection**—functional capabilities that guard against unauthorized data access and tampering, user errors, and computer failure.

3.1.19 **4a decibel (dB)**—sound level, measured between acoustic signals, equal to ten times the common logarithm of the ratio of the two levels.

3.1.20 **4a dBA**—the sound level measured through the A-weighing network of a sound level meter.

3.1.21 **de-emphasis**—the inverse of preemphasis, used for the purpose of restoring original vowel-consonant amplitude relationships in preemphasized speech; primarily useful in maintaining the “natural” sound quality. (See 3.1.56)

3.1.22 **default value**—a predetermined, frequently used value for a data field or control entry, intended to reduce required user entry actions.

3.1.23 **dialogue**—a structured series of interchanges between a user and a computer terminal. Dialogues can be computer initiated, for example, question and answer, or user initiated, for example, command languages.

3.1.24 **dichotic**—the condition in which the sound stimulus presented at one ear differs from the sound stimulus presented at the other ear. The stimulus may differ in sound pressure, frequency, phase, time, duration, or bandwidth.

3.1.25 **display format**—the organization of different types of data in a display, including information about the data such as labels, and other user guidance such as prompts, error messages, and so forth.

3.1.26 **effective temperature (ET)**—a single value combining the effect of temperature, humidity, and air movement on the sensation of warmth or cold felt by the human body. The numerical value is that of the temperature of still, saturated air, that would induce an identical sensation.

3.1.27 **emergency**—a condition of danger that requires immediate action.

3.1.28 **emergency alarm**—an alarm that indicates that danger exists and that immediate action must be taken. They include the general emergency alarm, fire alarms, those alarms giving warning of personnel hazard; including fire-extinguishing medium alarm, power-operated sliding watertight door closure alarm, and fire detection alarm.

3.1.29 **enter**—an explicit user action that effects computer processing of user entries. For example, after typing a series of numbers, a user might press an ENTER key that will add them to a database, subject to data validation.

3.1.30 **equipment**—general term designating any item or group of items.

3.1.31 **equipment failure**—the cessation of the ability to meet the minimum performance requirements of the equipment specifications. Further, equipment failure shall imply that the minimum specified performance cannot be restored through permissible readjustment of operator controls.

3.1.32 **facilities**—a physical plant, such as real estate and improvements thereto, including building and equipment, which provides the means for assisting or making easier the performance of a system function. The facilities to which this practice apply are those in which personnel perform system operational or maintenance duties.

3.1.33 **fail-safe design**—a design that, upon failure or malfunction of a component, subsystem, or system, automatically reverts to a predetermined design state of least critical consequence.

3.1.34 **field**—see 3.1.16.

3.1.35 **file**—a collection of data, treated as a single unit, that is stored in a computer.

3.1.36 **function key**—a key whose actuation will effect a control entry.

3.1.37 **help**—a capability that displays information upon user request for on-line guidance. HELP may inform a user generally about system capabilities or may provide more specific guidance in information-handling transactions.

3.1.38 **highlighting**—emphasizing displayed data or format features in some way, for example, through the use of underlining, bolding, or inverse video.
3.1.39 human engineering design criteria—the summation of available knowledge that defines the nature and limits of human capabilities as they relate to the checkout, operation, maintenance, or control of systems or equipment, to achieve optimum compatibility between equipment and human performance.

3.1.40 information—organized data that users need to perform their tasks successfully. Information serves as an answer to a user’s questions about data. It is used here to refer to the effective assimilation of data by a user.

3.1.41 interrupt—stopping an ongoing transaction to redirect the course of the processing. Examples of interrupt options are ABORT, BACKUP, CANCEL, and RESTART.

3.1.42 legibility—the ability to see and identify the alphanumeric characters, symbols, or other visual information on a display.

3.1.43 luminance contrast—the contrast between background and a figure equals the absolute difference between the higher luminance, \( L_1 \), and the lower luminance, \( L_2 \), divided by the higher luminance; that is, \( C = (L_1 - L_2)/L_1 \). Conversions to the other contrast formulae are as follows:

\[
\begin{align*}
L_1 & \quad L_2 & \quad L_1L_2 & \quad L_1-L_2 & \quad L_1+L_2 & \quad L_1/L_2 \\
100 & \quad 150 & \quad 1.0 & \quad 0.50 & \quad 0.33 & \quad 2.0 \\
100 & \quad 25 & \quad 3.0 & \quad 0.75 & \quad 0.60 & \quad 4.0 \\
100 & \quad 10 & \quad 9.0 & \quad 0.90 & \quad 0.82 & \quad 10.0 \\
\end{align*}
\]

where:

\( L_1 \) = image or subject luminance and

\( L_n \) = non-image or background luminance.

3.1.44 luminance ratio (LR)—the difference in luminance between the target subject and the surrounding field or background. For projection systems, the luminance ratio is equal to the light output of a projector (measured with no film in the projector) reflected off the screen (image luminance) divided by all the light falling on the screen (measured from the greatest viewing angle) other than that actually forming the image (non-image or background); as follows:

\[
LR = \frac{L_1}{L_n}
\]

3.1.45 macro—the capability to allow the user to assign a single name or function key to a defined series of commands for use with subsequent command entry. Sometimes called “smartkey.” Examples of use are storage of addresses or a single name or function key to a defined series of commands.

3.1.46 maintainability design—design considerations directed toward achieving those combined characteristics of the equipment and human beings that will enable the accomplishment of necessary maintenance quickly, safely, accurately, and effectively with minimum requirements for personnel, skills, special tools, and cost.

3.1.47 master caution (warning) signal—a signal that indicates that one or more caution (warning) lights has been actuated.

3.1.48 menu selection—a type of dialogue in which the user selects one item out of a list of displayed alternatives, whether the selection is by pointing, by entry of an associated option code, or by actuation of an assigned function key.

3.1.49 metric equivalents, abbreviations, and prefixes—Table 1 has been used herein to reflect the International System of Units (SI).

3.1.50 noise-cancelling (microphone)—a feature that reduces the masking effect of ambient noise upon speech impressed on a microphone, usually by providing equal access of the ambient noise to both surfaces of a diaphragm to achieve approximate equilibrium, effectively causing the noise to cancel itself out. Since the talker’s own voice output impinges on only one side of the microphone diaphragm, the talker’s signals are not subject to this cancellation, and are transmitted more favorably than if both ambient noise and speech fell simultaneously upon one face of the diaphragm.

3.1.51 nuclear, biological, chemical (NBC), and other contaminated environment survivability—NBC survivability includes both the instantaneous, cumulative, and residual effects of NBC weapons or environmental contamination upon a system, including its personnel. NBC or other environmental survivability describes the capability of a system to withstand the NBC environment, including decontamination, without losing the ability to accomplish its mission. For any system to be considered survivable in a contaminated environment, it must have at least three essential characteristics: decontaminability, hardness, and compatibility.

decontaminability—the ability of a system to be rapidly decontaminated to reduce the hazard to personnel operating.

### TABLE 1 Metric Equivalents, Abbreviations, and Prefixes

</table>

A more complete listing and discussion may be found in IEEE/ASTM.
maintaining, and resupplying it. 

hardness—the ability of a system to withstand the material damaging effects of NBC contamination and any decontamination agents and procedures required to remove it. compatibility—the ability of a system to be effectively operated, maintained, and resupplied by persons wearing the full NBC or other protective ensemble.

3.1.52 page—for this standard, the data appearing at one time on a single display screen.

3.1.53 panel—the front face of an assembly, normally used for mounting controls and displays.

3.1.54 panning—an orientation for display framing in which a user conceives of the display as moving over a fixed array of data. The opposite of scrolling.

3.1.55 peak-clipping (of speech signals)—a technique for controlling amplitude relationships in speech by limiting the instantaneous peak amplitudes to improve intelligibility of speech, usually followed by amplification of the signal to increase the amplitude of the clipped peaks to their original level, with proportional increase of the weaker speech sounds.

3.1.56 preemphasis—systematic distortion of the speech spectrum to improve intelligibility of speech sound by attenuating the low-frequency components of vowels (relatively unimportant for intelligibility) and proportionately increasing the amplitude of high-frequency vowel components and consonants (highly important for intelligible speech transmission).

3.1.57 primary alarm (essential alarm)—an alarm that indicates a condition that requires prompt attention to prevent an emergency condition. They include machinery alarms, control fault alarms, alarms indicating faults in emergency or primary (essential) alarm(s) or detection systems or failure of their normal power supplies, steering gear alarms, bilge alarms, engineer’s alarms, and personnel alarms.

3.1.58 prompt—an indicator provided by the computer that alerts the user that the computer is ready, data should be entered, and so forth.

3.1.59 query language—a language that allows users to compose control entries for displaying specified data from a database.

3.1.60 question and answer—a type of dialogue in which the computer displays questions, one at a time, for a user to answer.

3.1.61 readability—the ability to understand the message imparted by printed material, characters, numbers, or other visual information from a visual display.

3.1.62 remote-handling system—the equipment (for example, manipulators, viewing devices, and other aids) that permits personnel to extend their capabilities into remote environments.

3.1.63 scrolling—an orientation for display framing in which the user conceives of data as moving behind a fixed display frame. The opposite of panning.

3.1.64 seat reference point (SRP)—the point at which the center line of the seat back surface (depressed) and seat bottom surface (depressed) intersect. When the seat is positioned at the midpoint of the adjustment range(s), this intersection point is called the neutral seat reference point.

3.1.65 signals—a secondary, nonessential, advisory, or call indication. (Call is a request for contact, assistance, or action from one location to another.)

3.1.66 sound pressure level (SPL)—the pressure of an acoustic wave; usually expressed in decibels (dB), equal to 20 times the logarithm to the base 10 of the ratio of the effective root-mean-square (rms) pressure of this sound to the reference pressure, as follows:

$$\text{SPL} = 20 \log_{10} \frac{P}{20 \mu \text{Pa}}$$

where:

$$P = \text{the effective (rms) sound pressure in micropascals (µPa) or micronewtons per square metre (µN/M}^2\text{).} (20 \mu \text{Pa} = 20 \mu\text{N/M}^2 = 0.0002 \text{ microbar} = 0.0002 \text{ dynes/cm}^2\text{.)}$$

3.1.67 source documents—user’s documents, which are a source of data eventually processed by the computer program, such as target lists, supply codes, parts lists, maintenance forms, bills of lading, and so forth.

3.1.68 spatial relationship—the placement of controls, displays, and their related equipment so that it is visually obvious to an operator or maintainer that all components of a particular system are related. Further, when controls and displays are used for identical equipments or systems located in different parts of the same compartment, or in different compartments, the controls and displays shall be placed in the same location in respect to the equipments or systems at each installation. Consoles and overall work stations shall be designed and placed so the individual controls and displays on the consoles or work stations are arranged, as viewed by the operator facing the console or work station, in the same spatial arrangement as is the actual equipment being controlled or monitored at the console or work station.

3.1.69 special tools—tools not listed in the Federal Supply Catalog or meet the requirements of 3.1.75.

3.1.70 speech intelligibility—a measure of the percent of words, phrases, or sentences correctly understood over a given speech communication system in a given noise situation. It may be measured, when complying with this practice, by using either the phonetically balanced Monosyllabic Word Intelligibility Test or the Modified Rhyme Test (MRT), or may be calculated by the Articulation Index (AI).

3.1.71 speech interference level (SIL)—a measure of the effectiveness of noise in masking speech, defined as the arithmetic average of the same pressure levels of the interfering noise (in decibels re 20 µPa) in the four-octave bands centered on the frequencies 500, 1000, 2000, and 4000 Hz, respectively. The unit of speech interference is the decibel.

3.1.72 speech signal processing—the modification of the electrical signal representing speech to enhance the capability of a speech communications channel. Some examples are simple analog processing, Automatic Gain Control (AGC), frequency shaping, peak clipping, and syllabic compression.

3.1.73 speech spectrum—a segment of the range of audible frequencies containing the sounds of speech; defined as approximately the range from 80 to 8000 Hz.
3.1.74 **speech-to-noise ratio (peak speech to rms noise)**—
the ratio between the arithmetic mean of peak amplitudes of speech and the root-mean-square (rms) amplitude of background noise.

3.1.75 **standard tools**—standard tools (normally hand tools) used for the assembly, disassembly, inspection, servicing, repair, and maintenance of the equipment, and which are manufactured by two or more recognized tool manufacturing companies and are listed in those companies’ catalogs.

3.1.76 **string**—in the user’s context, a word, phrase, or number (string of characters) in the text or file. Normally used in the context of causing the computer to search for, find, or replace a desired “string.”

3.1.77 **text entry**—initial entry and subsequent editing of textual material, typified by messages.

3.1.78 **transaction**—an action by a user followed by a response from the computer. The term is used here to represent the smallest functional “molecule” of user-computer interaction.

3.1.79 **transillumination**—light passed through, rather than reflected off, an element to be viewed, for example, illumination used on console panels or indicators using edge or backlighting techniques on clear, translucent, fluorescent, or sandwich-type plastic materials.

3.1.80 **visibility**—the ability to see a visual display from its surrounding background.

3.1.81 **warning signal**—a signal that alerts the operator to a dangerous condition requiring immediate action.

3.1.82 **wet bulb globe temperature (WBGT)**—an index of the stress incorporating, as a major element, the evaporative cooling available to a natural wet bulb thermometer and calculated as follows:

\[
WBGT = 0.7TWB_{np} + 0.2T_g + 0.1T_a
\]  

where:

- \(TWB_{np}\) = nonpsychometric (np) wet-bulb (WB) temperature,
- \(T_g\) = temperature at interior center of a 15.2-cm (6-in.) black globe, and
- \(T_a\) = nonpsychometric, but shaded, dry bulb (air) temperature.

—In the absence of a radiant heat source (solar, engine, furnace, and so forth), a modified wet-dry (WD85) index shall be used where:

\[
WD85 = 0.85TWB_{np} + 0.15T_a
\]

4. **Significance and Use**

4.1 **Objectives**—Vessels, systems, and equipment shall provide work environments that foster effective procedures, work patterns, and personnel safety and health, and that minimize factors which degrade human performance or increase error. Design shall be such that operator workload, accuracy, time constraint, mental processing, and communication requirements do not exceed the operator’s physical or mental capacities. Design shall also minimize personnel and training requirements within the limits of time, cost, and performance trade-offs.

4.2 **Standardization**—Controls, displays, marking, coding, labeling, and arrangement schemes (equipment and panel layout) shall be uniform for common functions of all equipment. One criterion for selecting off-the-shelf commercial or government equipment shall be the degree to which the equipment conforms to this practice. Where off-the-shelf equipment requires modification to interface with other equipment, the modification shall be designed to comply with the criteria herein. Redesign of off-the-shelf equipment shall have the approval of the procuring activity.

4.3 **Function Allocation**—The design shall reflect allocation of functions to personnel, equipment, and personnel-equipment combinations to achieve the following:

4.3.1 **Required sensitivity, precision, time, and safety.**

4.3.2 **Required reliability of system performance.**

4.3.3 **Minimum number and level of skills of personnel required to operate and maintain the system.**

4.3.4 **Required performance in a cost-effective manner.**

4.4 **Human Engineering Design**—The design of vessels, systems, and equipment shall include the human engineering, life support, and biomedical design criteria, when applicable, contained in this practice to provide the following:

4.4.1 **Satisfactory atmospheric conditions including composition, pressure, temperature, and humidity, and also safeguards against uncontrolled variability beyond the limits contained herein.**

4.4.2 **Acceptable limits of acoustic noise, vibration, acceleration, shock, blast, impact forces, and safeguards against uncontrolled variability beyond the safe limits defined in this practice.**

4.4.3 **Protection from thermal, toxicological, radiological, mechanical, electrical, electromagnetic, pyrotechnic, visual, and other hazards.**

4.4.4 **Space for personnel, their equipment, and free volume for the movements and activities they are required to perform during operation and maintenance tasks under both normal and emergency conditions.**

4.4.5 **Physical, visual, auditory, and other communication links between personnel, and between personnel and their equipment, under both normal and emergency conditions.**

4.4.6 **Efficient arrangement of operation and maintenance workplaces, equipment, controls, and displays.**

4.4.7 **Natural or artificial illumination for the performance of operation, control, training, and maintenance.**

4.4.8 **Safe and adequate passageways, hatches, ladders, stairways, platforms, inclines, and other provisions for ingress, egress, and passage under normal, adverse, and emergency conditions.**

4.4.9 **Provision of acceptable personnel accommodations including body support and restraint, seating, rest, and sustenance, that is, food, water, and waste management.**

4.4.10 **Provision of nonrestrictive personal life support and protective equipment and clothing.**

4.4.11 **Provisions for minimizing psychophysiological stress effects of mission duration and fatigue.**

4.4.12 **Design features to ensure rapidity, safety, ease, and economy of operation and maintenance in normal, adverse, and emergency maintenance environments.**
4.4.13 Satisfactory remote handling provisions and tools.
4.4.14 Emergency systems for contingency management, escape, survival, and rescue.
4.4.15 Compatibility of the design, location, and layout of controls, displays, workspaces, maintenance accesses, storage provisions, and passenger compartments with the clothing and personal equipment (C/PE) to be worn by personnel operating, riding in, or maintaining all systems or equipment. Task allocation and control movements shall be compatible with restrictions imposed on human performance by C/PE.
4.4.16 Compatibility of control/display interfaces and procedures with human information processing capability, decision-making effectiveness, and the limits of short-term memory, long-term memory, and computation skill.
4.4.17 Immediate, accurate, and pertinent feedback to the operator of equipment or system performance after each control movement or other action taken by the operator.
4.5 Fail-Safe Design—A fail-safe design shall be provided in those areas in which failure can disable a vital system or cause catastrophe through damage to equipment, injury to personnel, or inadvertent operation of critical equipment.
4.6 Simplicity of Design—The equipment shall represent the simplest design consistent with functional requirements and expected service conditions. Where practical, it shall be capable of operation, maintenance, and repair in its operational environment by personnel with a minimum of training.
4.7 Interaction—The design of the system shall reflect the interaction requirements of crew-served equipment.
4.8 Safety—Design shall reflect applicable system and personnel safety factors, including minimization of potential human error in the operation and maintenance of the system, particularly under the conditions of stress.
4.9 Ruggedness—Systems and equipment shall be sufficiently rugged to withstand handling during operation, maintenance, supply, and transport within the environmental limits specified for those conditions in the applicable hardware or system specification.
4.10 Design for NBC and Other Contaminated Environment Survivability—As applicable, equipment design shall be compatible with NBC and other contaminated environment protection and shall permit performance of mission-essential operations, communications, maintenance, resupply, and decontamination tasks by suitably clothed, trained, and acclimatized personnel for the survival periods and NBC or other environments required by the system. Equipment design shall also facilitate contaminated environment hardness surveillance and shall minimize susceptibility to reduction of inherent contaminated environment hardness as a result of errors or damage induced by maintenance or operator personnel.
4.10.1 NBC or other contaminated environments hardness shall be easily verifiable by maintenance personnel before and after maintenance actions (hardness surveillance).
4.10.2 NBC or other contaminated environments hardness shall not be degraded when routine (scheduled) and corrective (unscheduled) maintenance are performed.
4.10.3 Maintenance of the equipment’s inherent NBC or other contaminated environments hardness shall not be depen- dent on maintenance personnel expertise and critical alignments/maintenance actions.
4.11 Design for Electromagnetic Pulse (EMP) Hardening—As applicable, equipment design shall be compatible with EMP-hardening requirements, including personal accommodations such as EMP-hardened electrical power outlets and antenna lead-ins within EMP-hardened facilities or spaces. Access shall be provided to EMP-hardened facilities or spaces without the need to open doors or hatches which form part of an electromagnetic barrier protecting the space. Items such as surge arrestors, terminal protection devices, and filters, which form part of an electromagnetic barrier for protection against EMP effects, shall be accessible.

5. Control/Display Integration

5.1 Control/Display Relationship—The relationships of a control to its associated display and the display to the control shall be immediately apparent and unambiguous to the operator. Controls shall be located adjacent to (normally under or to the right of) their associated displays and positioned so that neither the control nor the hand normally used for setting the control will obscure the display.
5.2 Control/Display/Equipment Relationships—Where controls and displays (such as a motor controller and gage board) are associated with a specific piece of equipment (for example, a pump, filter, heater, and so forth) and the controls or displays are located for local operation of the equipment, they shall be located above, or immediately adjacent to, the equipment so that it is visually obvious that all of the components are functionally related. Where other design considerations or where a deliberate choice is made to place the controls and displays remote from the equipment which precludes this preferred location, the controls and displays shall be mounted in such a manner that the relationship of location of the controls and displays matches the arrangement of the equipment to which they belong. Controls and displays used on identical systems located in different locations in the same compartment, or in different compartments, shall be located in the same spatial relationship to the equipment in each compartment. Figs. 2-5 illustrate these principles.
5.3 Design—Control-display relationships shall be apparent through proximity, similarity of groupings, coding, framing, labeling, and similar techniques.
5.4 Complexity and Precision—The complexity and precision required of control manipulation and display monitoring shall be consistent with the precision required of the system.
Control/display complexity and precision shall not exceed the capability of the operator (in terms of discrimination of display detail) or exceed the operator's manipulative capability under the dynamic conditions and environment (in terms of manual dexterity, coordination, or reaction time) in which human performance is expected to occur.

5.5 Feedback—Feedback on control response adequacy shall be provided as rapidly as possible. For keyboards, feedback shall be provided to the operator before entry to ensure that the keyed entry is, in fact, errorless and the one that the operator desires to enter.

5.6 Illumination—Adjustable illumination shall be provided for visual displays, including display, control, and panel labels and critical markings, that must be read at night or under darkened conditions.

5.7 Simultaneous Access—If more than one crew member must have simultaneous access to a particular group of controls or displays to ensure proper functioning of a system or subsystem, the operator assigned to control and monitor a particular function or group of related functions shall have physical and visual access to all controls, displays, and communication capability necessary to perform assigned tasks adequately.

5.8 Position Relationships:

5.8.1 Functional Grouping—Functionally related controls and displays shall be located in proximity to one another and arranged in functional groups, for example, power, status, test.

5.8.2 Functional Group Arrangement:

5.8.2.1 Sequence—Functional groups of controls and displays shall be located to provide for left-to-right (preferred) or top-to-bottom order of use, or both.

5.8.2.2 Access—Providing that the integrity of grouping by function and sequence is not compromised, the more frequently used groups and the most important groups shall be located in areas of easiest access. Control-display groups required solely for maintenance purposes may be located in positions providing a lesser degree of access relative to operating groups.

5.8.2.3 Functional Group Marking—Functional groups may be set apart by outlining with contrasting lines that completely encompass the groups. Color numbers in this paragraph are in accordance with FED-STD-595. Where such coding is specified by the procuring activity, and where gray panels are used, noncritical functional groups (those not associated with emergency operations) shall be outlined with a
1.5-mm (1/16-in.) black border (27038), and those involving emergency or extremely critical operations shall be outlined with a 5-mm (3/16-in.) red border (21136). As an alternate method, contrasting color pads or patches may be used to designate both critical and noncritical functional areas, subject to prior approval by the procuring activity. When red compartment lighting is used, an orange-yellow (23538) and black (27038) striped border shall be used to outline functional groups involving emergency (hazardous or potentially hazardous) conditions requiring immediate attention) or extremely critical operations.

5.8.4.4 Consistency—Location of recurring functional groups and individual items shall be similar from panel to panel. Mirror image arrangements shall be used only with the approval of the procuring activity.

5.8.3 Location and Arrangement—Whenever an operator must use a large number of controls and displays, their location and arrangement shall be designed to aid in determining which controls are used with which displays, which equipment component each control affects, and which equipment component each display describes.

5.8.4 Arrangement Within Groups—Controls and displays within functional groups shall be located according to operational sequence or function, or both.

5.8.4.1 Left-to-Right Arrangement—If there is more than one row of displays, and their corresponding controls cannot be located under each display, or placed in the same row arrangement under the displays as the displays are arranged, then the controls shall be located as shown in Fig. 6.

5.8.4.2 Vertical and Horizontal Arrays—If a horizontal row of displays must be associated with a vertical column of controls or vice versa, the farthest left item in the horizontal array shall correspond to the top item in the vertical array, and so forth. However, this type of arrangement shall be avoided whenever possible.

5.8.4.3 Simultaneous Use—A visual display that must be monitored concurrently with manipulation of a related control shall be located so that the operator is not required to observe the display from an extreme visual angle and thus introduce the possibility of parallax error.

5.8.4.4 Multiple Displays—When the manipulation of one control requires the reading of several displays, the control shall be placed as near as possible to the related displays and preferably beneath the middle of the displays, but not to obscure displays when manipulating the control.

5.8.4.5 Combined Control—When separate displays are affected by a combined control (for example, concentrically ganged knobs), the display shall be arranged from left to right with the combined control underneath the center of the displays, but not to obscure displays when manipulating controls.

5.8.4.6 Separate Panels—When related controls and displays must be located on separate panels and both panels are mounted at approximately the same angle relative to the operator, the control positions on one panel shall correspond to the associated display positions on the other panel. The two panels shall not be mounted facing each other.

5.8.4.7 Component Groups—When a group of equipment components has the same function, the related control and display positions shall be oriented to correspond to those of the controlled and monitored components. (For example, the position of propulsion engine controls shall be oriented as if the operator faces the normal direction of vessel movement.)

5.8.4.8 Emergency Use—Emergency displays and controls are those associated with a hazardous or potentially hazardous condition that requires immediate action to prevent injury to the crew or damage to the ship. They shall be located where they can be seen and reached with minimum delay (for example, warning lights within a 30° cone about the operator’s normal line of sight; emergency control close to its related warning display or the nearest available hand in its nominal operating position).

5.9 Movement Relationships:

5.9.1 Lack of Ambiguity—Display indicators shall clearly and unambiguously direct and guide the appropriate control response. The response of a display to control movements shall be consistent, predictable, and compatible with the operator’s expectations.

5.9.2 Time Lag—The time lag between the response of a system to a control input and the display presentation of the response shall be minimized, consistent with safe and efficient system operation.

5.9.3 Moving Pointer Circular Scales—Clockwise movement of a rotary control or movement of a linear control forward, up, or to the right shall produce a clockwise movement of circular scale pointers and an increase in the magnitude of the reading.

5.9.4 Moving Pointer Linear Scales—Clockwise movement of a rotary control or movement of a linear control forward, up, or to the right shall produce a movement up or to the right for horizontal and vertical scale pointers and an increase in the magnitude of the reading.

5.9.5 Fixed Pointer Circular Scale—Displays with moving scales and fixed pointers or cursers shall be avoided. When circular fixed-pointer, moving-scale indicators are necessary, clockwise movement of a rotary control or movement of a linear control forward, up, or to the right shall normally produce a counterclockwise movement of the scale and an increase in the magnitude of the reading.

5.9.6 Fixed Pointer Linear Scale—When use of vertical or horizontal fixed pointer, moving-scale indicators is necessary, clockwise movement of an associated rotary control or movement of a linear control forward, up, or to the right shall normally produce a movement of the scale down or to the left and an increase in the magnitude of the reading.

5.9.7 Direct Linkage—When there is a direct linkage between control and display (for example, radio frequency selector and station pointer), a rotary control shall be used if the indicator moves through an arc of more than 180°. If the indicator moves through an arc of less than 180° a linear control may be used, provided that the path of control movement parallels the average path of the indicator movement and that the indicator and control move in the same relative direction.

5.9.8 Common Plane—Controls shall be selected so that the direction of movement of the control will be consistent with the related movement of an associated display, equipment component, or vessel.

5.9.9 Parallel Movement—Direction-of-motion relationships shall be adhered to when control and display are parallel in line of movement.

5.9.10 Labeling—When control-display relationships specified herein cannot be adhered to, controls shall be clearly labeled (in accordance with Section 27) to indicate the direction of control movement required.

5.9.11 Movement Direction—When a rotary control and a linear display are in the same plane, the part of the control adjacent to the display shall move in the same direction as the moving part of the display.

5.10 Control Display Movement Ratio:

5.10.1 Minimization of Time—Control display ratios for continuous adjustment controls shall minimize the total time required to make the desired control movement (slowing time plus fine adjusting time), consistent with display size, tolerance requirements, viewing distance, and time required.

5.10.2 Range of Display Movement—When a wide range of display element movement is required, small movement of the control shall yield a large movement of the display element. When a small range of display movement is required, a large movement of the control shall result in small movement of the display, consistent with final accuracy required.

5.10.3 Knob, Coarse Setting—When a knob is provided for making coarse display element settings on linear scales (0.4- to 2.5-mm (0.016- to 0.100-in.) tolerance), an 2.5-mm (0.016- to 0.100-in.) tolerance), an approximately 25 to 50 mm (1 to 2 in.) of display element movement shall be provided for one complete turn of the knob.

5.10.4 Knob, Fine Setting—For fine setting on linear scales (0.2- to 0.4-mm (0.008- to 0.016-in.) tolerance), a 25 to 50 mm (1 to 2 in.) of display element movement shall be provided for one complete turn of the knob.

5.10.5 Bracketing—When bracketing is used to locate a maximum or minimum rather than a specific value (for example, as in tuning a transmitter), the control knob shall swing through an arc of not less than 175 mrad (10°) nor more than 525 mrad (30°) either side of the target value to make the peak or dip associated with that value clearly noticeable.

5.10.6 Lever, Coarse Setting—When a lever is provided for coarse settings (0.4- to 2.5-mm (0.016- to 0.100-in.) tolerance), one unit of display element movement shall be used to three units of lever movement.

5.10.7 Lever, Two-Dimensional Setting—When a lever is provided to make settings in two dimensions to coarse tolerances (2.5 mm (0.100 in.), one unit of display element movement shall be used to two and one-half units of lever movement.

5.10.8 Counters—When counters are provided, the control-display ratio shall be such that one revolution of the knob produces approximately 50 counts (that is, the right hand drum rotates 5 times).

6. Visual Displays, General Information

6.1 General—Visual displays shall be used to provide the operator with a clear indication of equipment or system conditions for operation under any condition commensurate with the operational and maintenance philosophy of the system under design.

6.2 Alerting/Warning—An alerting/warning display shall provide the operator with a greater probability of detecting the triggering condition than normal observation would provide in the absence of the display.

6.3 Display Illumination and Light Distribution:

6.3.1 Display Illumination:

6.3.1.1 Normal—When maximum dark adaptation is not required, low-brightness white light (preferably integral and adjustable as appropriate) shall be used; however, when complete dark adaptation is required, low-level illumination shall be accomplished by use of gray filter sleeves over the lamps. The white light transmittance through the sleeves shall be either 5.0, 2.5, or 1.0 %.

6.3.1.2 Night Vision Device Compatibility—When night vision devices will be worn or used by the operator(s), display illumination color shall be low-density blue-green light (incandescent filament through a high-pass filter with a 600-nm cutoff). The color selected shall provide the operator(s) with the capability to obtain required display information rapidly and accurately with unaided eye vision or via viewing with the night vision device. The color selected shall also provide the operator(s) with the ability to obtain required display information rapidly and accurately during any daylight condition. The lighting shall be continuously variable to the full OFF position. In the OFF position, no current shall flow through the lamps.

6.3.1.3 Field Use Panel Dimming—When control or annunciator panels will be viewed by personnel out of doors at night, maximum panel illumination shall be provided when a dimming rotary control is at its extreme clockwise rotation. Maximum illumination is that in accordance with 32.9. No current shall be provided to luminaries at extreme counter-clockwise orientation of a dimming control. Panel light levels shall be continuously variable from 0.1 cd/m² (0.03 fl) near OFF to 3.5 cd/m² (1 fl) at 50 % of clockwise rotation.

6.3.2 Light Distribution—Where multiple displays are grouped together, lighting shall be balanced across the instrument panel such that the mean indicator luminances of any two instruments shall not differ by more than 33 % across the range of full ON to full OFF. Light distribution shall be sufficiently
uniform within an integrally illuminated instrument such that
the ratio of standard deviation of indicator element luminances
to mean indicator luminance shall not be more than 0.25, using
eight or more equally spaced test measurements.

6.3.3 Contrast—Sufficient contrast shall be provided be-
tween all displayed information and the display background to
ensure that the required information can be perceived by the
operator under all expected lighting conditions.

6.4 Information:

6.4.1 Content—The information displayed to an operator
shall allow the operator to perform the intended mission, but
shall be limited to that which is necessary to perform specific
actions or to make decisions.

6.4.2 Precision—Information shall be displayed only within
the limits and precision required for specified operator actions
or decisions.

6.4.3 Format—Information shall be presented to the opera-
tor in a directly usable form. Requirements for transposing,
computing, interpolating, or mentally translating into other
units shall be prohibited.

6.4.4 Redundancy—Redundancy in the display of informa-
tion to a single operator shall be avoided unless it is required
to achieve specified reliability.

6.4.5 Combining Operator/Maintainer Information—
Operator and maintainer information shall not be combined in
a single display unless the information content and format are
well suited to, and time is compatible for, both users.

6.4.6 Display Failure Clarity—A method shall be provided
to determine if a display or circuit has failed.

6.4.7 Display Circuit Failure—Failure of the display circuit
shall not cause a failure in the equipment associated with the
display.

6.4.8 Unrelated Markings—Trademarks and company
names or other similar markings not related to the panel
function shall not be displayed on the panel face or on the
displays.

6.4.9 Duration—For signals or displays that frequently or
consistently change their outputs, the information displayed
shall have durations of sufficient length to be reliably detected
under expected operator workload and operational environ-
ment.

6.4.10 Timeliness—Displays, such as cathode ray tube dis-
plays, requiring refreshed information shall be updated in a
synchronous manner, and be refreshed to a degree of timeliness
required by personnel in the normal operating or servicing
mode.

6.4.11 Advisory and Alerting—Displays such as multifunc-
tion displays, cathode ray tube displays, and other visual
display devices displaying simultaneous and integrated informa-
tion shall advise or alert operating personnel to information
that becomes critical within the display.

6.4.12 NBC Contamination—As applicable, display charac-
teristics (for example, clarity, legibility) shall be compatible
with viewing while wearing an NBC or other protective mask.
Displays or indicators that show the presence of NBC or other
environmental contamination agents shall also show when such
agent concentrations decrease to safe levels.

6.4.13 Numeric Digital Displays—Numeric digital displays
shall not be used as the only display of information when
trends in display change or perception of a display pattern is
required of the operator. Numeric digital displays shall not be
used when rapid or slow digital display rates inhibit perception
of the display.

7. Location and Arrangement of Visual Displays

7.1 Location—Displays, including sight fill tubes on tanks,
shall be located and designed so that they may be read to the
degree of accuracy required by personnel in the normal
operating or servicing positions without requiring the operator
to assume an uncomfortable, awkward, or unsafe position.
Dual gages providing an IN and OUT reading (that is, suction
and discharge, voltage in and out, and so forth) shall be
arranged so that the gage with the IN reading is on the left
(preferred) or top, and the gage with the OUT reading is on the
right (preferred) or bottom, unless the IN and OUT displays are
a part of a system mimic that does not permit this arrangement.

7.2 Access—Visual displays shall be visually accessible
from the normal work position without requiring the operator
to stand on equipment components, handrails, wireways or
wireway supports, or nearby pipes (especially if they are
insulated). Flashlights or other special equipment shall not be
required to read the display. No display shall require the
removal of a cover (that is, sheathing, deck plate, and so forth)
or any other component to be visible, unless the display is
noncritical and a clearly marked quick access door is provided.
Where possible, the access door shall be of transparent
material. Light-emitting diodes (LEDs) used on PC boards
inside consoles for calibration or troubleshooting shall be
visible from the maintainer’s normal work position once the
console doors or maintenance access openings are open.

7.3 Orientation—Displays, such as thermometers, pressure
gages, and so forth, that are attached directly to a pipe shall be
mounted so they are read upright, or turned no more than 90°,
from the upright position. Displays located immediately adja-
cent to walkways shall not be located lower than 460 mm (18
in.) above the deck to prevent them from being kicked and
broken, unless the display face is protected by a nonbreakable
transparent material. Armored sight gages shall be oriented so
the sight gage is directly visible from the normal work position.

7.4 Reflection—Displays shall be constructed, arranged, and
mounted to prevent reduction of information transfer as a result
of the reflection of the ambient illumination from the display
cover. Reflection of instruments and consoles in windows and
other reflective enclosures shall be avoided. If necessary,
techniques (such as shields and filters) shall be used to ensure
that the system performance will not be degraded. Sight gages
that contain clear liquid shall have a color backing so as to
provide a color contrast between the liquid and the color
backing to make the liquid more visible in the gage.

7.5 Vibration—Vibration of visual display shall not degrade
user performance below the level required for mission accom-
plishment (see 32.13).

7.6 Grouping—All displays necessary to support an opera-
tor activity or sequence of activities shall be grouped together.

7.7 Function and Sequence—Displays shall be arranged in
relation to one another according to their sequence of use or the
7.8 Frequency of Use—Displays used most frequently shall be grouped together and placed in the primary visual zone in accordance with Fig. 7 and Fig. 8.

7.9 Importance—Important or critical displays shall be located in the primary visual zone or otherwise highlighted.

7.10 Consistency—The arrangement of displays within a system shall be consistent from application to application.

7.11 Maximum Viewing Distance—The viewing distance from the eye reference point of the seated operator to displays located close to their associated controls shall not exceed 635
mm (25 in.). Otherwise, there is no maximum limit other than that imposed by legibility limitations, which shall be compensated for by proper design.

7.12 Minimum Viewing Distance—The viewing distance from the operator’s eye to the face of the displays, with the exception of cathode ray tube displays and collimated displays, shall never be less than 330 mm (13 in.) and preferably not less than 510 mm (20 in.).

8. Coding of Visual Displays

8.1 Objectives—Coding techniques shall be used to facilitate discrimination between individual displays, identification of functionally related displays, indication of relationship between displays, and identification of critical information within a display.

8.2 Techniques—Displays shall be coded by color, size, location, shape, or flash coding, as applicable.

8.3 Standardization—All coding within the system shall be uniform and shall be established by agreement with the procuring activity.

9. Transilluminated Displays

9.1 Three general types of transilluminated displays that may be used include the following: single- and multiple-legend lights, which present information in the form of meaningful words, numbers, symbols, and abbreviations; simple indicator lights; and, transilluminated panel assemblies, which present qualitative status or system readiness information.

9.2 Use—Transilluminated indicators shall be used to display qualitative information to the operator requiring either an immediate reaction by the operator or to draw attention to an important system status. Such indicators may also be used occasionally for maintenance and adjustment function.

9.3 Equipment Response—Lights, including those used in illuminated push buttons, shall display equipment response and not control position (that is, a lighted ON push button for a pump means that the pump is running, not that the control has been pushed).

9.4 Information—Lights and related indicators shall be used sparingly and shall display only that information necessary for effective system operation.

9.5 Positive Feedback—Changes in display status shall signify changes in functional status rather than simply indicate that a control has been activated (for example, a lighted VALVE CLOSED indicator shall signify that the valve is actually closed, not that the VALVE CLOSED control has been activated). The absence or extinguishment of a signal or visual indication shall not be exclusively used to denote a malfunction, no go, or out-of-tolerance condition; however, the absence of a power on signal or visual indication shall be acceptable to indicate a power-off condition for operational displays only—not for maintenance displays. The absence or extinguishment of a signal or visual indication shall not be used to indicate a ready or in tolerance condition, unless the status or caution light filament and its associated circuitry can be easily tested by the operator and operator perception of such events is not time critical.

9.6 Grouping—Master caution, master warning, master advisory, and summation lights used to indicate the condition of an entire subsystem shall be discriminable from the lights which show the status of the subsystem components, except as required under 9.9.

9.7 Location—When a transilluminated indicator is associated with control, the indicator light shall be so located that it can be associated with the control without error and shall be visible to the operator during control operation. When a transilluminated indicator is used in conjunction with a meter or readout as an indication of an out-of-tolerance condition (such as, a LOW PRESSURE lighted annunciator associated with a pressure meter), it shall be placed directly above the meter. Other arrangements are permissible with the approval of the procuring activity.

9.8 Location, Critical Functions—For critical functions, indicators shall be located within 265 mrad (15°) of the operator’s normal line of sight (as shown in Fig. 8). Warning lights shall be an integral part of, or located adjacent to, the lever, switch, or other control device by which the operator is to take action, or placed as defined in 9.7.

9.9 Maintenance Displays—Indicator lights used solely for maintenance and adjustment shall be covered or nonvisible during normal equipment operation, but shall be readily accessible when required.

9.10 Luminance—The luminance of transilluminated displays shall be compatible with the expected ambient luminance level, and shall be at least 10% greater than the surrounding luminance. Where glare must be reduced, the luminance of transilluminated displays shall not exceed 300% of the surrounding luminance.

9.11 Luminance Control—When displays will be used under varied ambient illuminance, a dimming control shall be provided. The range of the control shall permit the displays to be legible under all expected ambient illuminance. The control shall be capable of providing multiple-step or continuously variable illumination. Dimming to full OFF may be provided in noncritical operations, but shall not be used if inadvertent
failure to turn on an indicator could lead to critical operator failures, such as failure to detect or to perform a critical step in an operation.

9.12 False Indication or Obscuration—Provision shall be made to prevent direct or reflected light from making indicators appear illuminated when they are not, or to appear extinguished when they are illuminated. Self-reflection shall be minimized by proper orientation of the display with respect to the observer.

9.13 Contrast Within the Indicator—The luminance contrast (see 3.1.43) within the indicator shall be at least 50 %. This 50 % luminance contrast requirement does not apply to special displays specifically designed for legibility in sunlight or where legibility is obtained through color contrast (and other techniques) rather than luminance contrast. For low ambient illumination applications, this ratio shall be at least 90 %, with the background luminance less than the figure luminance.

9.14 Lamp Redundancy—Meters, counters, and other displays that use incandescent bulbs to illuminate the display face may incorporate filament redundancy or dual bulbs. When one filament or bulb fails, the intensity of the light shall decrease sufficiently to indicate the need for lamp replacement, but not so much as to degrade operator performance. Lighted annunciators need not have this capability provided a lamp test button is provided.

9.15 Lamp Testing—When indicator lights using incandescent bulbs are installed on a control panel or console, a master light test control shall be incorporated. Panels containing three or fewer lights may be designed for individual press-to-test bulb testing. Circuity shall be designed to test the operation of the total indicator circuit. If dark adaptation is a factor, a means for reducing total indicator light brightness during test operation shall be provided.

9.16 Lamp Removal, Method—Where possible, lamps shall be removable and replaceable from the front of the display panel. The procedure for lamp removal and replacement shall not require the use of tools and shall be easily and rapidly accomplished. If a tool is required, special stowage for it will be provided on the panel.

9.17 Lamp Removal, Safety—Display circuit design shall permit lamp removal and replacement while power is applied without causing failure of indicator circuit components or imposing personnel safety hazards.

9.18 Indicator Covers—If design of legend screen or indicator covers does not prevent inadvertent interchange, a means shall be provided for checking the covers after installation to ensure that they are properly installed.

9.19 Color Coding—Transilluminated displays shall conform to the following color coding scheme.

9.19.1 Flashing Red—Flashing red shall be used to denote emergency conditions that require immediate operator action to avert impending personnel injury, equipment damage, or both. Flash rates shall be in accordance with 9.20. Flashing red lights not installed on consoles shall be limited to general alarm signals only in accordance with U.S. Coast Guard Reg. 113.25-9.

9.19.2 Yellow—Yellow shall be used to advise an operator that a condition exists that is marginal or beyond operational limits, but does not require immediate operator action. Yellow shall also be used to alert the operator to situations in which caution, recheck, or unexpected delay is necessary.

9.19.3 Green—Green shall be used to indicate that the monitored equipment is operating satisfactorily or that a condition is satisfactory and it is all right to proceed.

9.19.4 White—White shall be used to indicate system conditions that do not have right or wrong implications, such as alternative functions (for example, Missile No. 1 selected for launch, and so forth) or transitory conditions (for example, action or test in progress, function available), provided such indication does not imply success or failure of operations.

9.19.5 Blue—Blue may be used for an advisory light, but use of blue shall be avoided whenever possible.

9.19.6 Ship specifications shall not mandate the use of any transilluminated display (such as LEDs) that cannot meet the color codes described.

9.20 Flashing Lights—The use of flashing lights shall be minimized. Flashing lights shall be used only when it is necessary to notify the operator of some condition that is out of tolerance and requires attention. The flash rate shall be within three to five flashes per second with approximately equal amounts of ON and OFF time. Flashing lights shall become steady beaming once the operator acknowledges the flashing light by activating a control that deactivates the flasher circuit. Flashing lights that could be simultaneously active shall have synchronized flashes. If the indicator is energized and the flasher device fails, the light shall illuminate and burn steadily (see 15.2) or a separate indicator showing flashing circuit failure, shall be provided.

9.20.1 Red—Shall be used to alert an operator that the system or any portion of the system is inoperative or that a successful mission is not possible until appropriate corrective or override action is taken. Examples of indicators that shall be coded red are those which display such information as “no-go,” “error,” “failure,” “malfunction,” and so forth.

9.21 Legend Lights—Legend lights (also called annunciators) shall be used in preference to simple indicator lights except where design considerations demand that simple indicators be used. The number of legend lights shall be kept to a minimum. Legend lights shall be used to provide qualitative information, not to give commands.

9.21.1 Color Coding—Legend lights shall be color coded in conformance with 9.19.

9.21.2 Positive Versus Negative Legend—When the operator’s dark adaptation must be maintained, or where legibility in high ambient illumination is critical, the illuminated label/opaque background format shall be used and the illuminated background/opaque label format shall be used only for critical alerting indicators (for example, master warning lights). Where operator dark adaptation is not required, the illuminated background/opaque label format shall be used. Contrast reversal may be used under these conditions to designate displays that have physical appearance similar to legend switches on the same panel.

9.21.3 Lettering—The size and other characteristics of lettering shall conform to Section 27 herein or as otherwise specified by the procuring activity.
9.21.4 Visibility and Legibility—With the exception of danger and caution indicators, the lettering on single-legend indicators shall be visible and legible whether or not the indicator is energized.

9.21.5 Multifunction Legends—Indicators designed to provide alternately presented legends shall present only one legend at a time, that is, only the legend in use shall be visible. If the indicator device uses stacked legends, it shall be designed so that:

9.21.5.1 When the rear legend is energized, it shall not be obscured by the front legend.

9.21.5.2 Parallax is minimized.

9.21.5.3 Rear legends have approximately equal brightness to front legends, and the contrast between rear legends and background is equal to that of the front legend and its background.

9.22 Simple Indicator Lights—Simple indicator lights shall be used only when design considerations preclude the use of legend lights.

9.22.1 Spacing—The spacing between adjacent edges of simple round indicator light fixtures shall be sufficient to permit unambiguous labeling, signal interpretation, and convenient bulb removal.

9.22.2 Coding—Simple indicator lights shall be coded in conformance with Table 2.

9.23 Transilluminated Panel Assemblies—Transilluminated (integrally lighted) panel assemblies may be used to perform the following:

9.23.1 Provide illuminated labels for a control panel.

9.23.2 Provide a light source for illuminating transilluminated control knobs.

9.23.3 Provide illuminated association markings on a control panel, such as connecting lines between controls, outlines around a functionally related group of controls or displays, or both.

9.23.4 Create a pictorialized representation of a system process, communication network, or other information/component organization.

9.24 Large, Single Pictorial Graphic Panels—Large, single pictorial graphic panels, used to display system processing, communications networks, or similar applications, shall comply with requirements for visibility, legibility, color, and illumination as specified herein.

9.25 Relamping—When replaceable incandescent lamps are used as the illuminant source for integral lighting of panel assemblies, lamps shall be accessible without disconnecting the panel(s). A sufficient number of lamps shall be provided so that failure of one lamp will not cause any part of the display to be unreadable.

9.26 Brightness—Brightness of illuminated markings and transilluminated controls shall be compatible with the ambient environment and operating conditions (for example, dark adaptation requirements). Brightness control (dimming) by the operator shall be provided where applicable to control/maintain appropriate visibility and operator dark adaptation level.

### 10. Scale Indicators

10.1 Types of Scale Indicators—The types of scale indicators that may be used include the following:

10.1.1 Moving pointer, fixed scale, circular, curved (arc), horizontal straight, and vertical straight.

10.1.2 Fixed pointer, moving scale, circular, curved (arc), horizontal straight, and vertical straight.

10.2 Use—The use of scale indicators shall conform to the criteria in Table 3 as well as the specific criteria contained in this section. Moving-pointer, fixed-scale indicators are preferred to fixed-pointer, moving-scale indicators. The latter should be used only when necessitated by operational requirements or other conditions, and when approved by the procuring activity.

10.3 Type of Information—Scale indicators shall be used to display quantitative information in combination with qualitative information (such as trend and direction of motion) and where only quantitative information is to be displayed and there is no requirement (such as speed and accuracy of response) which demands the use of printers or counters.

10.4 Linear Scales—Linear scales shall be used except where system requirements and the scale clearly dictate non-linearity to satisfy operator information requirements. Nonlinear scales shall be used only with the approval of the procuring activity.

10.5 Scale Marking and Numbering:

10.5.1 Graduation Markings—Scale graduations shall be in increments of one, two, or five units or decimal multiples thereof (except as noted in 10.5.2). No more than three sizes of marks shall be used on any scale. The scales that require three sizes of marks include those which have numbered values in multiples of ten but are graduated in 5 and 10° intervals.

10.5.1.1 Intermediate Marks—The number of intermediate marks between numbered scale pointers shall not exceed nine as shown in Fig. 9 and illustrations of scales graduated in various ways are provided in Fig. 10.

10.5.1.2 Major Marks—Except for measurements that are normally expressed in decimals, whose numbers shall be used for major graduation marks.

10.5.2 Scale Numerals—Intermediate marks shall ordinarily not be numbered. On fixed scales, numerals shall be
vertically oriented, and on rotating scales, numerals shall be radially oriented and positioned so as to be upright when read against the pointer. Bearing dials shall have numerals (and major graduation marks) at either 10 or 30° as shown in Fig. 11.

10.5.3 Scale Length—Scales shall start and end on a major graduation mark even if this puts either or both ends beyond the usable range of the scale (for example, if the maximum voltage which can be read on an instrument is 23 V, the scale shall go at least to 25 V where there could be a major graduation mark). The tips shall never be more than 1.5 mm (⅛ in.) from the scale graduations. The tip shall be equal in width to the minor scale graduations.

10.7.2 Normal Pointer Position—The normal (or zero) pointer position of a scalar indicator shall be at 12 o’clock for right-left directional information, and at 9 o’clock for up-down directional information. For purely quantitative information, either position may be used.

10.7.3 Pivot Point—Pointers shall be pivoted at the right for vertical scales and at the bottom for horizontal scales.

10.7.4 Mounting—The pointer shall be mounted as close as possible to the face of the dial to minimize parallax.

10.7.5 Luminance Contrast—Luminance contrast of at least 75 % shall be provided between the scale face, the markings, and the pointer.

10.7.6 Color—Pointers shall be the same color as the numbers and scale divisions.

10.7.7 Pointers per Shaft—There shall not be more than two pointers on a single shaft.

10.7.8 Reciprocal Pointers—With reciprocal (double-ended) pointers, it shall be easy to distinguish the end that indicates the reading.
10.7.9 Edgewise Indicators—In edgewise indicators such as rectangular meters with straight scales, only the tip of the pointer may be visible. If so, it shall be distinctive and obvious: a flag, spade, or target pointer.

10.7.10 Dial Faces—If the display is used for making a setting, such as tuning in a desired wavelength, it is usually advisable to cover the unused portion of the dial face. The open window shall be large enough to show at least one numbered graduation on each side of any setting. If the display is used in tracking, for example, a heading indicator, the whole dial face shall be exposed.

10.7.11 Coding—When certain operating conditions (such as normal operating temperature or dangerous pressure level) always fall within a limited range of the total scale, these ranges shall be made readily identifiable by means of pattern, color, or shape coding applied to the face of the instrument. Use of red color coding shall be limited to critical situations. Operating zones may be shape coded when the indicator must be viewed in very low-light-level work environments, for example, 0.07 to 0.7 cd/m² (0.02 to 0.2 ft·L), or where the illuminant color will cause difficulty in discrimination of colors. See Fig. 12.

10.7.11.1 Use—Coding on the face of scale indicators may be used to convey such information as desirable operating range, dangerous operating level, caution, undesirable, and inefficient.

10.7.11.2 Pattern or Color Coding—When certain operating conditions always fall within a given range on the scale,
these areas shall be made readily identifiable by means of pattern or color coding applied to the face of the instrument. Color or pattern coding shall be applied to the face of the instrument, not outside the face on the panel or bezel around the instrument. No lines, labels, or any other marks shall be between the instrument pointer and the color or pattern coding.

10.7.11.3 Choice of Colors—Red, yellow, and green may be applied, provided they conform to the meanings specified in 9.19 and are distinguishable under all expected lighting conditions.

10.7.11.4 Pattern Coding—Zone scales may be shape coded when the indicator must be viewed in blackout stations or where the illuminant color will cause difficulty in color band discrimination.

10.8 Moving-Pointer, Fixed-Scale Indicators:

10.8.1 Numerical Progression—Numbered scales shown increase clockwise, from left to right, or from bottom to top, depending on scale layout (circumferential or linear in horizontal or vertical axis).

10.8.2 Orientation of Numerals—Numbers on fixed scales shall appear vertical (upright) to the observer.

10.9 Circular Scales:

10.9.1 Scale Reading and Pointer Movement—To display values ranging from negative through zero to positive, consistently locate the zero point at the 9 or 12 o’clock position. Positive values shall increase when the pointer moves clockwise (to the right), and negative values shall increase when the pointer moves counterclockwise (to the left).

10.9.2 Zero Position and Pointer Movement—When positive and negative values are displayed around a zero point, the magnitude of positive values shall increase with movement of the pointer up or to the right, and the magnitude of negative values shall increase with movement of the pointer down or to
10.9.3 Scale Break—There shall be an obvious break of at least 10° of arc between the two ends of the scale, except on multirevolution instruments such as clocks.

10.9.4 Number of Pointers—Except for clocks or watches (which often have three hands), not more than two coaxial pointers shall be used on a single-dial indicator without approval from the procuring activity.

10.9.5 Aligned Pointers for Check Reading—When a stable value exists for given operating conditions in a group of circular-scale indicators, they shall be arranged either in rows so that all pointers line up horizontally on the 9 o’clock position under normal operating conditions or in columns so that all pointers line up vertically in the 12 o’clock position under normal operating conditions in accordance with Fig. 14. If a matrix of indicators is needed, preference shall be given to the 9 o’clock position.

10.9.6 Relative Position of Scale Marks and Numbers—When reading time and accuracy are critical, circular scale markings and location of associated numbers shall be arranged to prevent pointers from covering any portion of scale marks or numerals, and scale marks/numbers shall be on, or close to, the plane of the pointer tip (that is, to avoid visual parallax) in accordance with Fig. 15. If readout accuracy is not critical (the gross relationship between the pointer and the numeral is all that is required), then arrangement of numerals inside the scale annulus is acceptable. (See examples in Fig. 16.)

10.10 Curved (Arc), Horizontal, or Vertical Straight Scales:

10.10.1 Scale Reading and Pointer Movement—The magnitude of the scale reading shall increase with movement of the pointer up or to the right.

10.10.2 Zero Position and Pointer Movement—The position of the zero value on curved or straight scales shall conform to criteria in Fig. 13.

10.10.3 Relative Position of Pointers, Scales, and Numerals—The numbers shall be located on the side of the graduation marks opposite the pointer. The graduation marks shall be aligned on the side of the pointer and stepped on the side of the numbers. The relative position of pointers, scales, and numerals shall conform to criteria in Fig. 16.

10.11 Fixed-Pointer, Moving-Scale Indicators:

10.11.1 Open Window Display—When the display will be used primarily for setting in a value (for example, tuning to a desired wavelength), only the portion of the scale of interest shall be exposed, that is, the rest of the scale is covered to reduce visual clutter and confusion. The open window shall be of sufficient size to permit view of at least one numbered graduation either side of the desired setting, that is, at least two number values shall appear within the window at all times unless the scale is finite and the dial cannot be rotated continuously through successive rotations in the same direction. If the display will be used for tracking (as in the case of a directional indicator), the entire face of the dial shall be exposed.

10.11.2 Circular Scales—There are ambiguities in associating moving circular scales with control movements; thus moving-scale fixed-pointer indicators are not recommended. Moving circular scales necessarily violates one of these principles of human engineering:
When a dial scale is of finite length, it should be numbered so that value increase is clockwise. The zero starting point should be approximately at the 7 o'clock position. There should be an obvious "break" between the two ends of the scale of at least 10° of arc.

When multirevolution pointer movement is involved, the zero reference should be at the top of the dial, and there should be no break between scale ends. No more than two pointers shall be used except for special cases, e.g., clock (with second hand).

Azimuth dial scales shall be laid out with the zero (or north) reference at the top of the dial, and scale values shall increase clockwise at least every 30° reference should be numbered.

Positive/negative dial formats shall be laid out with the zero (or "null" position) located at the 9-, 12-, or 3-o'clock position. Scale values shall increase right or left, or up or down as appropriate to provide positive/negative pointer movement relationships.

FIG. 13 Zero Position and Pointer Movement for Circular Dial Displays
10.11.2.1 Principle 1—Scale numbers shall increase in a clockwise direction. Values on moving circular scales shall therefore increase with counterclockwise rotation of the dial face.

10.11.2.2 Principle 2—The direction of movement of the associated control shall be compatible with the direction of movement of the dial, for example, clockwise movement of the control shall result in clockwise movement of the dial.

10.11.2.3 Principle 3—Clockwise movement of a control shall result in an increase.

10.11.2.4 If Principle 2 is compromised, for example, clockwise movement of the control results in counterclockwise movement of the dial, operators err in the initial direction of turn. If Principle 3 is compromised, a standard control movement-system relationship is violated.

10.11.3 The following practices are recommended for designing circular moving scales to minimize the effects of incompatibilities:

10.11.3.1 The numbers shall increase clockwise around the face for controls without dial face masks. Therefore, the dial face moves counterclockwise to increase readings.

10.11.3.2 If the associated control has no direct effect on the performance of the equipment (such as tuning in radio stations, and so forth), the scale shall rotate counterclockwise (increase) when the associated knob or crank is turned counterclockwise.

10.11.3.3 If the associated control has a direct effect on the performance of the equipment (such as speed, direction, and so forth), the scale shall rotate counterclockwise (increase) with a clockwise, upward, or rightward movement of the associated control.

10.11.4 Straight Scales Moving Vertically and Horizontally—Straight scales that move vertically and horizontally exhibit the same direction-of-motion ambiguities as circular-moving scales. The numbers shall be printed so they increase from bottom to top or from left to right on the scale plate itself. Then the scale shall increase (move downward or
to the left) when the associated knob or crank is moved clockwise or when the associated lever is moved upward or to the right.

10.11.5 Accepted Deviations—Deviations from the previously listed scale-design principles may be made when other considerations have prime importance. Certain unique applications of scales require other design features and compromises may be required. For example, an azimuth indicator with the numerical progression of 30, 60, 90, and so forth, is less satisfactory than those previously recommended. However, this arrangement represents a compromise between the best numbering progression and a manageable size of the dial. Where the azimuth indicator is a small dial, the numbered cardinal points, north, east, south, west, serve as anchoring points in interpreting this indication, and a progression by 30’s is a good solution. Where the dial can be made large enough, the major intervals shall be marked by 10’s.

10.12 Nonlinear Scales—Nonlinear scales condense a large range into a relatively small space, yet permit sensitive readings at certain critical ranges of the scale. When error tolerances are a constant percentage of the indication, a logarithmic scale is very suitable. However, logarithmic scales shall show enough numbered graduation marks to prevent operators from reading the scale as if it were linear.

10.13 Moving Tape Displays—When the scale length required for acceptable readout accuracy exceeds the limits of the capacity of the display package, that is, compaction of scale markings would make the display legible or subject to readout error, moving-tape scale format shall be considered.

10.14 Composite Scalar/Pictorial Displays—Combination of scales, pointer, or pictorialized symbols may be used to combine functionally related information into a single instrument or display (for example, artificial horizon/command heading, true/relative bearing, and other similar combinations). Design of significant reference features (or ship symbols, or pitch scales, and so forth) shall conform to the general criteria herein relative to direction-of-motion, scale-pointer relationships, legibility, and so forth. Color contrast shall be used to aid the operator in differentiating between various elements of the combined or composite display (such as dark land versus light sky, and so forth).

10.15 Head-Up Display—The head-up display (a positional/command type of display) typically projected on the windshield or window in front of an operator to provide information without the operator having to look at instrument panel or the console displays) may be considered only with the express approval of the procuring agency.
11. Cathode Ray Tube (CRT) Displays

11.1 Signal Size—When a target of complex shape is to be distinguished from a nontarget shape that is also complex, the target signal shall subtend not less than 6 mrad (20 min) of visual angle and shall subtend not less than ten lines or resolution elements. Image quality shall be consistent with the operator’s needs.

11.2 Viewing Distance—A 400-mm (16-in.) viewing distance shall be provided whenever practicable. When periods of scope observation will be short, or when dim signals must be detected, the viewing distance may be reduced to 250 mm (10 in.). Design shall permit the observer to view the scope from as close as desired. Displays that must be placed at viewing distances greater than 400 mm (16 in.) as a result of other considerations shall be appropriately modified in aspects such as display size, symbol size, brightness ranges, line-pair spacing, and resolution.

11.3 Screen Luminance—The ambient illuminance shall not contribute more than 25% of screen brightness through diffuse reflection and phosphor excitation. A control shall be provided to vary the CRT luminance from 10% of minimum ambient luminance to full CRT luminance. A control shall be provided to vary the luminous symbol/dark background or dark symbol/luminous background contrast ratio. CRTs shall comply with 13.11.

11.4 Faint Signals—When the detection of faint signals is required and when the ambient illuminance may be above 0.25 fc (2.7 lx), scopes shall be hooded, shielded, or recessed. (In some instances, a suitable filter system may be used, subject to approval by the procuring activity.)

11.5 Luminance Range of Adjacent Surfaces—The luminance range of surfaces immediately adjacent to scopes shall be between 10 and 100% of screen background luminance. With the exception of emergency indicators, no light source in the immediate surrounding area shall be of a greater luminance than the CRT signal.

11.6 Ambient Illuminance—The ambient illuminance in the CRT area shall be appropriate for other visual functions (setting controls, reading instruments, maintenance) but shall not degrade the visibility of signals on the CRT display. When a CRT display is used in variable ambient illuminance, illuminance controls shall be provided to dim all light sources, including illuminated panels, indicators, and switches in the immediate area. Automatic adjustment of CRT brightness may be used if the CRT brightness is automatically adjusted as a
function of ambient illuminance, and the range of automatic adjustment is adequate for the full range of ambient illuminance.

11.7 Reflected Glare—Reflected glare shall be minimized by proper placement of the scope relative to the light source, use of a hood or shield, or optical coatings or filter control over the light source.

11.8 Adjacent Surfaces—Surfaces adjacent to the scope shall have a dull matte finish. 

11.9 Pictorial/Graphic Situation Formats—Pictorial or situation data such as plan position indicator data, shall be presented as luminous symbols/dark background.

11.10 Font Legibility—Where alphanumeric characters appear on CRT-like displays, the font style shall allow discrimination of similar characters, such as Letter 1 and Number 1; Letter Z and Number 2.

12. Large-Screen Displays

12.1 Use—Large-scale displays may be used when:

12.1.1 A group of operators frequently refer to the same information and are required to interact as a team based on the same information.

12.1.2 One or more members of a team of operators must move about, yet require frequent referral to information required to make decisions, and which they cannot carry with them, or do not have displayed at their assigned position(s).

12.1.3 Space or other constraints preclude the use of individual displays for each team member to call up commonly used information.

12.1.4 It may be desirable to have general information available to persons who shall not interrupt ongoing group operations by looking over the shoulder(s) of individual operator(s) to see their individual displays.

12.2 Avoidance—Large-screen displays shall not be used when the environmental conditions do not allow satisfactory observational geometry to ensure that all critical operators have appropriate visual access in terms of viewing distance, angle, and lack of interference from intervening objects, personnel, or ambient lighting. If the display is optically projected, see 13.8.

12.3 Viewing Distance—The display shall not be placed further from an observer than will provide appropriate resolution of critical detail presented on the display (see legibility requirements of Section 27). The display shall not be closer to any observer than one half the display width or height, whichever is greater.

12.4 Physical Interruption of View—Large-screen displays shall not be located with respect to critical observers so that the view of the display is obscured regularly by persons moving about by normal traffic patterns.

12.5 Control of Displayed Information—Large-screen group display systems shall be designed so that critical information cannot be modified or deleted inadvertently or arbitrarily, and therefore:

12.5.1 Control of changes in the group display shall be under the control of designed operators who operate according to preestablished procedures, upon command of a person in charge, or both.

12.5.2 When an individual must make changes that are of interest only to him or her, a separate, remote display shall be provided.

12.6 Content of Displayed Information—The content of displayed information shall be evident to a trained observer without requiring reference to display control settings.

12.7 Mounting Height—Large-screen displays, such as status boards in CIC rooms, which are mounted vertically, shall be no lower than 457.2 mm (18 in.) (preferred), 304.8 mm (12 in.) absolute, above the deck, or no higher than 1981.2 mm (78 in.) above the deck.

13. Other Displays

13.1 Types—Where applicable, direct-reading counters, printers, plotters, flags, optical projection, LED, gas discharge, liquid crystal, and electroluminescent displays may be used providing the color codes of 9.19 are not violated.

13.2 Applications—The selection of the above types of displays for various applications shall be based on the following specific criteria as well as the criteria in Table 2. Plotters, printers, and recorders shall not be used as the primary display for systems.

13.3 Counters:

13.3.1 Use—Counters shall be used for presenting quantitative data when a continuous trend indication is not required and when a quick, precise indication is required.

13.3.2 Mounting—Counters shall be mounted as close as possible to the panel surface so as to minimize parallax and shadows and maximize the viewing angle. When counters are used in equipment that is mounted on a vertical surface, the mounting height shall provide for full view of the counter wheel.

13.3.3 Spacing Between Numerals—The horizontal separation between numerals shall be between one quarter and one half the numeral width. Commas shall not be used.

13.3.4 Movement:

13.3.4.1 Snap Action—Numbers shall change by snap action in preference to continuous movement.

13.3.4.2 Rate—Numbers shall follow each other not faster than two per second when the observer is expected to read the numbers consecutively.

13.3.4.3 Direction—The rotation of the counter reset knob shall be clockwise to increase the counter indication or to reset the counter.

13.3.4.4 Reset—Counters used to indicate the sequencing of equipment shall be designed to be reset automatically upon completion of the sequence. Provision shall also be made for manual resetting. Where push buttons are used to reset mechanical counters manually, actuating force required shall not exceed 16.7 N (60 oz).

13.3.5 Display Design—Numerical design, movement (rate and direction), and arrangement shall be as shown in Fig. 17 and Table 4.

13.3.6 Illumination—Counters shall be self-illuminated when used in areas in which ambient illumination will provide display luminance below 3.5 cd/m (1 ft-L).

13.3.7 Finish—The surface of the counter drums and surrounding areas shall have a dull finish to minimize glare.
13.3.8 Contrast—Color of the numerals and background shall provide high contrast (black on white or converse, as appropriate).

13.4 Printers:

13.4.1 Use—Printers shall be used when a visual record of data is necessary or desirable. Use of printers shall conform to Table 3.
13.4.2 Visibility—The printed matter shall not be hidden, masked, or obscured in a manner that impairs direct reading.

13.4.3 Contrast—A minimum of 75% luminance contrast shall be provided between the printed material and the background on which it is printed.

13.4.4 Illumination—The printer shall be provided with internal illumination if the printed matter is not legible in the planned operational ambient illumination.

13.4.5 Take-up Provision—A take-up device for printed material shall be provided.

13.4.6 Annotation—Where applicable, printers shall be mounted so that the printed matter (for example, paper, metallized paper) may be easily annotated while still in the printer.

13.4.7 Legibility—The print output shall be free from character line misregistration, character tilt, or smear.

13.4.8 Printed Tapes—The information on the tapes shall be printed in such a manner that it can be read as it is received from the machine without requiring the cutting and pasting of tape sections.

13.4.9 Control, Replenishment, and Service—Printers shall conform to the criteria of 13.5.8 for plotters and recorders.

13.5 Plotters and Recorders:

13.5.1 Use—Plotters and recorders may be used when a visual record of continuous graphic data is necessary or desirable.

13.5.2 Visibility—Critical graphics (those points, curves, and grids that must be observed when the recording is being made) shall not be obscured by pen assembly, arm, or other hardware elements.

13.5.3 Contrast—A minimum of 50% luminance contrast (see 3.1.43) shall be provided between the plotted function and the background on which it is drawn.

13.5.4 Take-Up Device—A take-up device for extruded plotting materials shall be provided when necessary or desirable.

13.5.5 Job Aids—Graphic overlays should be provided where they may be critical to proper interpretation of graphic data as it is being generated. Such aids shall not obscure or distort the data.

13.5.6 Smudging/Smearing—The plot shall be resistant to smudging or smearing under operational use.

13.5.7 Annotation—Where applicable, plotters and recorders shall be designed or mounted so that the operator can write on or mark the paper while it is still in the plotter/recorder.

13.5.8 Control, Replenishment, and Service—Plotters and recorders shall conform to criteria herein with regard to the following:

13.5.8.1 Controls and displays used to start, stop, or adjust the machine and critical operating elements.

13.5.8.2 Positive indication of the remaining supply of plotting materials (paper, ink, ribbon).

13.5.8.3 Insertion, adjustment for operation, and removal of paper, replenishment of ink supply, replacement of pen, or other items determined to be operator tasks, without requiring disassembly, special equipment, or tools.

13.5.8.4 Minor servicing on site by a technician, such as the adjustment of the drive system, cleaning, or replacement of operating items that ordinarily would not be available to an operator.

13.6 Flags:

13.6.1 Use—Flags shall be used to display qualitative, nonemergency conditions. Use of flags shall conform to Table 3.

13.6.2 Mounting—Flags shall be mounted as close to the surface of the panel as possible without restricting their movement or obscuring necessary information.

13.6.3 Snap Action—Flags shall operate by snap action.

13.6.4 Contrast—A minimum of 75% luminance contrast (see 3.1.43) shall be provided between flags and their backgrounds under all expected lighting conditions.

13.6.5 Malfunction Indication—When flags are used to indicate the malfunction of a visual display, the malfunction position of the flag shall obscure part of the operator’s view of the malfunctioning display and shall be readily apparent to the operator under all expected levels of illumination.

13.6.6 Legend—When a legend is provided on the flag, the lettering shall appear upright when the flag assumes the active or no-go position.

13.6.7 Test Provision—A convenient means shall be provided for testing the operation of flags.

13.7 Large-Screen Optical Projection Displays:

13.7.1 Use—Providing ambient light can be properly controlled, optical projection displays are suitable for applications requiring group presentation, pictorial and spatial information, past history versus real-time presentation, synthetically generated pictures, simulation of the external world, and superposition of data from more than one source. Rear projection shall be used where physical obstructions to front projection result in poor visibility or where work areas require high ambient illumination for other activities.

13.7.2 Seating Area—Viewing distance/image width relationship and off-centering viewing of optical projection displays for group viewing shall conform to the preferred limits of Table 5 and shall not exceed the acceptable limits indicated. For individual viewing from a fixed location, off-centerline viewing shall not exceed 175 mrad (10°).

13.7.3 Image Luminance and Light Distribution—Image luminance and light distribution shall conform to the preferred limits and shall not exceed the acceptable limits of Table 5.
any case, the luminance of the screen center at maximum viewing angle shall be at least half its maximum luminance.

13.7.4 Legibility of Projected Data:

13.7.4.1 Style—A simple style of numerals and letters shall be used. Capital letters shall be used, rather than lowercase, except for extended copy or lengthy messages. Stroke width shall be ⅛ to ⅜ of numeral or letter height, but may be narrower for light markings on a dark background. Stroke width shall be the same for all letters and numerals of equal height. Letter and numeral widths, character spacing, and word spacing shall conform to 28.10.

13.7.4.2 Size—The height of letters and numerals (except single-stroke characters, such as the Number 1) shall not be less than 4.5 mrad (15 min) of visual angle and, in no instance, shall be less than 3 mrad (10 min) as measured from the longest anticipated viewing distance.

13.7.5 Contrast:

13.7.5.1 Luminance Ratio—Under optimal ambient lighting conditions, the luminance ratio (see 3.1.44) for optically projected displays shall be 500:1. The minimum luminance ratio for viewing charts, printed text, and other line work via slides or opaque projectors shall be 5:1. For projections that are limited in shadows and detail, such as animation and photographs with limited luminance range, the minimum luminance ratio shall be 25:1. For images that show a full range of colors in black-and-white photographs), the minimum luminance ratio shall be 100:1.

13.7.5.2 Direction of Contrast—Contrast may be either light on a dark background or vice versa, except where superposition is used. For subtractive superposition (at the source), data shall be presented as dark markings on a transparent background. For additive superposition (at the screen), data shall be presented as light markings on an opaque background. Colored markings against colored backgrounds of comparable brightness shall be avoided.

13.7.6 Alignment—Misregistration of superimposed alphanumeric data or other symbols shall be minimized.

13.7.7 Keystone Effects—Projector-screen arrangement shall minimize the keystone effect, that is, the distortion of projected data proportions caused by nonperpendicularity between projector and screen.

13.8 Light-Emitting Diodes (LEDs):

13.8.1 General—The standard for LEDs will be the same as the requirements for transilluminated displays, Section 9 of this practice, unless otherwise specified herein.

13.8.2 Use—LEDs may be used for transilluminated displays, including legend and simple indicator lights, and for matrix (alphanumeric) displays, only if the display is bright enough to be readable in the environment of intended use enclosure, bright sunlight, low temperature.

13.8.3 Intensity Control—The dimming of LEDs shall be compatible with the dimming of incandescent lamps.

13.8.4 Color Coding—LED color coding shall conform to 9.19 herein, with the exception that red alphanumeric displays and red bar segments for vertical, horizontal, and circular meters may be used with approval from the procuring activity. However, red LEDs shall not be located in the proximity of emergency red lights used as outlined in 9.19.1.

13.8.5 Lamp Testing—LED indicator lights with 100 000 h or longer MTBF (Mean Time Between Failure) shall not require the lamp test capability specified in 9.15.

13.9 Dot Matrix/Segmented Displays:

13.9.1 General—The design criteria below shall be applied to those displays (LED, CRT, gas discharge, liquid crystal, and incandescent) used for presentation of alphanumeric and symbolic information.

13.9.2 Use—Dot matrix, 14-segment, and 16-segment displays may be used for applications involving interactive computer systems, instruments, navigation, and communication equipment, where the presentation of alphanumeric, vector-graphic, symbolic or real-time information is required. Seven-segment displays shall only be used for applications requiring numeric information.

13.9.3 Symbol Definition—The smallest definition for a dot matrix shall be 5 by 7 dots, with 7 by 9 preferred. If system requirements call for symbol rotation, a minimum of 8 by 11 is required, with 15 by 21 preferred.

13.9.4 Alphanumeric Character and Symbol Sizes—Alphanumeric and symbolic characters shall not subtend less than 4.7 mrad (16 min) of visual angle.

13.9.5 Use of Uppercase—Alphanumeric characters shall be uppercase.

13.9.6 Viewing Angle—The optimum viewing angle is perpendicular to the display. Dot matrix or segmented displays shall not be presented for viewing at an angle larger than 61° off axis.

13.9.7 Emitter Color—Monochromatic displays shall use the following colors in order of preference: green (555 nm), yellow (575 nm), orange (585 nm), and red (660 nm). Blue emitters shall not be used.

13.9.8 Intensity Control—Dimming controls shall be provided where applicable to maintain appropriate legibility and operator dark adaptation level.

13.9.9 Lamp Testing—See 9.15.

13.9.10 Location of Red Alphanumeric LEDs/Segmented Displays—Red LEDs/segmented displays shall not be grouped with or located adjacent to red warning lights.
13.10 Electroluminescent Displays:
13.10.1 Use—Electroluminescent displays may be used wherever system requirements dictate the use of transilluminated displays provided they comply with 9.19. In addition, they may replace existing mechanical instrumentation while offering advantages of lighter weight, conservation of panel space, lower power requirements, lack of heat production, uniform distribution of illumination, longer life, elimination of parallax, and flexibility of display. Electroluminescent displays may also be used where sudden lamp failure could result in catastrophic consequences.

13.10.2 Alphanumeric Character and Symbol Sizes—The height of alphanumeric characters and geometric and pictorial symbols shall not sub tend less than 4.5 mrad (15 min) of visual angle. Alphanumeric characters shall be composed of uppercase letters.

13.11 Special Requirements for TV Display:
13.11.1 Resolution—Resolution shall be 400 lines or greater both horizontally and vertically except that for low-resolution applications, line spacing need not be closer than needed to subtend 1 min of arc from the normal viewing position.

13.11.2 Rate and Interlacing—Except for slow-scan systems for reproduction of static images, the frame rate for sampling of video material shall be a minimum of 30/s. There shall be two display scan fields per frame period (or a minimum of 60/s) with the lines of the second scan in the frame period interlaced with the lines of the first scan.

13.11.3 Phosphors—The phosphors for TV screens shall have short or medium persistence and high output such as the P-4 or P-23 for black-and-white monitors and the P-22 or P-27 for color monitors.

13.11.4 Distortion—Spot diameter shall not vary by more than a ratio of 1.5 to 1.0 at any two points on the screen. Distortion shall not be sufficient to cause obvious nonlinearity anywhere on the screen when viewing alphanumeric formats or picture images.

13.11.5 Gray Scale—There shall be a minimum of at least five distinguishable gray scale levels. When the requirements include interpretation of handwriting, resolution of fine detail, or complex image interpretation, up to eight gray scale levels shall be provided.

13.12 Special Requirements for Radar/Sonar Displays:
13.12.1 Types of Scans—The type of scan selected shall be appropriate to the operator’s task in using the radar/sonar data. Commonly used scan types shall be selected in preference to novel or experimental scan types except as approved by the procuring activity.

13.12.2 Display Scale Sizes and Range Ring Values—Display scale shall be selected on the basis of the following criteria.

13.12.2.1 If rings are to be used, the display scales selected shall be compatible with the use of a constant number of range rings regardless of the scale, as given in Table 6.

13.12.2.2 Display systems capable of presenting alphanumerics shall present range ring values on the CRT.

13.12.3 Appropriate scale limits considering radar/sonar characteristics such as maximum range, range resolution, bearing resolution, and maximum range of detection. For example, the display scales for use with a shipboard surface search radar having a minimum range of 200 m (656.2 ft) and a maximum range of 60 km (57.3 miles) might be as follows:

13.12.3.1 Minimum—2 km (1.24 miles) not more than ten times the minimum range value, to capitalize on range determination at close-in ranges as in station keeping.

13.12.3.2 Maximum—75 km (46.6 miles) accommodates maximum range of the radar and is a good scale for estimation and interpolation.

13.12.4 Area and scaling limits suggested by representative operational situations including warfare operations, search patterns, maneuvers, flight operations, and so forth. For example, an aircraft carrier that may have a number of missions involving close-in aircraft operations at ranges from 15 to 30 km (9.3 to 18.6 miles) shall have a 30-km (18.6-miles) display scale for monitoring and control of aircraft on such missions.

14. Audio Displays, General Information
14.1 Use—Audio displays shall be provided when:

14.1.1 The information to be processed is short, simple, and transitory, requiring immediate or time-based response.

14.1.2 The common mode of visual display is restricted by overburdening; ambient light variability or limitation; operator mobility; degradation of vision by vibration, hypoxia, or other environmental considerations; or anticipated operator inattention.

14.1.3 The criticality of transmission response makes supplementary or redundant transmission desirable.

14.1.4 It is desirable to warn, alert, or cue the operator to subsequent additional response.

14.1.5 Custom or usage has created anticipation of an audio display.

14.1.6 Voice communication is necessary or desirable.

14.1.7 Signal Type—When an audio presentation is required, the optimum type shall be presented in accordance with Table 7.

14.2 False Alarms—The design of audio display devices and circuits shall preclude false alarms.

14.3 Failure—The audio display device and circuit shall be designed to preclude warning signal failure in the event of system or equipment failure and vice versa.

14.4 Circuit Test—All audio displays shall be equipped with circuit test devices or other means of operability test.

14.5 Use with Several Visual Displays—One audio signal may be used in conjunction with several visual displays, provided that immediate discrimination is not critical to personnel safety or system performance.

15. Audio Warnings
15.1 Audible Alarms—Audible alarms shall be provided, as necessary, to warn personnel of impending danger, to alert an
operator to a critical change in system or equipment status, and to remind the operator of a critical action, or actions, that must be taken. An alerting/warning system or signal shall provide the operator with a greater probability of detecting the triggering condition than his normal observation would provide in the absence of the alerting/warning system or signal.

15.2 Audible Alarms and Visual Displays at Consoles and Other Work Stations—Audible alarms shall be used as a supplement to visual alarms at operator consoles and other work stations to notify an operator that a serious malfunction has occurred, the nature of which is discernible through some visual display(s). When a supplemental audible alarm is used at a console or work station, it shall be a siren (used in conjunction with a flashing red light) for a danger situation or a horn (used with a yellow light) for a caution situation. Caution signals shall be readily distinguishable from danger signals and shall be used to indicate conditions requiring awareness, but not necessarily immediate action. The audible alarm shall be silenced when the operator acknowledges the visual alarm display. If a second malfunction occurs in the same equipment or system before the first malfunction has been corrected, both the audible and visual alarms shall operate again. Other types of audible alarms may be used in lieu of the two listed here with the written approval of the procuring agency. Whichever signals are selected, the danger and caution alarms must be readily distinguishable from each other and used consistently throughout the ship. Acceptable alarm types for emergency and primary alarms are shown in Fig. 18.

15.3 General Use Audible Alarms—Audible alarms shall be used throughout the ship to notify crew (and passengers for commercial ships) of hazardous situations such as fire and smoke detection, release of fire-extinguishing material in a closed space, impending collision, and ship exposure to biological, chemical, or radiological agents. In addition, audible alarms may be placed in certain crew accommodation spaces (for example, the engineer’s berthing compartment) to notify them of a malfunction or problem in a part of the ship for which they are responsible. Audible alarms may also be used to notify an operator of an incoming telephone call or a change in the engine room telegraph (EOT) when the possibility exists that the operator would be in an area where such supplemental alarms would be needed. When general audible alarms are used, they shall comply with the following requirements.

15.4 Visual Alarms Used with General Audible Alarms—Visual alarms (that is, rotating or flashing lights) shall be used
in conjunction with general audible alarms in spaces with high ambient noise levels or under other circumstances where the audio alarms may not be discernible. When used the visual alarms shall comply with the following:

15.4.1 Be clearly visible and distinguishable, either directly or by reflection, in all parts of the space in which they are used;
15.4.2 Be of a color in accordance with 9.19, color coding (for Navy ships) or IMO standards for commercial ships;
15.4.3 Flash in accordance with 9.20; and
15.4.4 Flash as long as the audible alarm is activated, and for those audible alarms which are cancelled by activation of an alarm acknowledge switch the visual alarm shall be cancelled by the same alarm acknowledge switch that is used to silence the audible alarm.

16. Characteristics of Audible Alarms

16.1 Frequency:

16.1.1 Range—The range shall be between 200 and 5000 Hz and, if possible, between 500 and 1500 Hz. When signals must travel over 300 m (985 ft), frequencies below 1000 Hz shall be used. Frequencies below 500 Hz shall be used when signals must bend around obstacles or pass through partitions.

16.1.2 Different Characteristics—When several different audible alarms are to be used concurrently, discernible differences in the spectral composition or the temporal pattern, or both, shall be provided. When specific recognition of individual alarms is important (for example, the differences between a general alarm and fire detected alarm), their differences shall be coded (that is, the waveforms altered) to ensure that each alarm is quickly and easily distinguished.

16.1.3 Spurious Signals—The frequency of a warning tone shall be different from that of the electric power used in the system to preclude the possibility that a minor equipment failure may generate a spurious signal.

16.2 Intensity:

16.2.1 Compatibility with Acoustical Environment—The intensity, duration, and source location of audio alarms and signals shall be compatible with the acoustical environment of the intended receiver as well as the requirements of other personnel in the signal areas. See 17.1.

16.2.2 Compatibility with Clothing and Equipment—As applicable, audio signals shall be loud enough to be heard and understood through equipment or garments (for example, parka hood, NBC protective hood, hearing protective devices) covering both ears of the listener.

16.2.3 Discomfort—Audio warning signals shall not be of such intensity as to cause discomfort or “ringing” in the ears as an aftereffect.

17. Signal Characteristics in Relation to Operational Conditions and Objectives

17.1 Audibility—A signal-to-noise ratio of at least 20 dB shall be provided in at least one-octave band between 200 and 5000 Hz at the operating position of the intended receiver. However, in no case shall an audible alarm exceed 120 dB (A) except in extremely noisy compartments in which case the alarm shall exceed the maximum ambient noise level by 10 dB (A) up to a maximum of 140 dB (A).

17.2 Alerting Capability:

17.2.1 Attention—Signals shall not be so startling as to preclude appropriate responses or interfere with other functions by holding attention away from other critical signals.

17.2.2 Onset and Sound Pressure Level—The onset of critical alerting signals shall be sudden, and high sound pressure level shall be provided as specified in 17.1.

17.2.3 Dichotic Presentation—When earphones will be worn in the operational situation, a dichotic presentation shall be used whenever feasible, alternating the signal from one ear to the other by means of a dual-channel headset.

17.2.4 Headsets—Operators who normally wear earphones covering both ears shall have the audible alarms presented in the headset as well as in the work area. A dichotic presentation shall be used so as to provide the audible alarm to one ear and the normal auditory signals to the other on an alternating basis. Binaural headsets shall not be used in an operational environment below 85 dB (A) when that environment may contain sounds that provide the operator with useful information which cannot be presented through the headsets.

17.3 Discriminability:

17.3.1 Use of Different Characteristics—When several different audio signals are to be used to alert an operator to different types of conditions, discriminable difference in intensity, pitch, or use of beats and harmonics shall be provided. If absolute discrimination is required, the number of signals to be identified shall not exceed four.

17.3.2 Coding—Where discrimination of warning signals from each other will be critical to personnel safety or system performance, audio signals shall be appropriately coded. Alarms that are perceptibly different shall correlate with different conditions requiring critically different operator responses (such as maintenance, emergency conditions, and health hazards). Such signals shall be sufficiently different to minimize the operator’s search of visual displays.

17.3.3 Critical Signals—The first 0.5 s of an audio signal requiring fast reaction shall be discriminable from the first 0.5 s of any other signal that may occur. Familiar signals with established names or associations shall be selected. Speech shall be used whenever feasible.

17.3.4 Action Segment—The identifying or action segment of an audio warning signal shall specify the precise emergency or condition requiring action.

17.3.5 Differentiation From Routine Signals—Audio alarms intended to bring the operator’s attention to a warning or a caution condition shall be differentiated from routine signals, such as bells, buzzers, and normal operation noises.

17.3.6 Prohibited Types of Signals—The following types of signals shall not be used as warning devices where possible as a result of confusion that might exist because of the operational environment:

17.3.6.1 Modulated or interrupted tones that resemble navigation signals or coded radio transmissions.
17.3.6.2 Steady signals that resemble hisses, static, or sporadic radio signals.
17.3.6.3 Trains of impulses that resemble electrical interference whether regularly or irregularly spaced in time.
17.3.6.4 Simple warbles that may be confused with the type made by two carriers when one is being shifted in frequency (beat-frequency-oscillator effect).

17.3.6.5 Scrambled speech effects that may be confused with cross-modulation signals from adjacent channels.

17.3.6.6 Signals that resemble random noise, periodic pulses, steady or frequency modulated simple tones, or any other signals generated by standard countermeasure devices (for example, “bagpipes”).

17.3.6.7 Signals similar to random noise generated by air conditioning or any other equipment.

17.4 Compatibility:

17.4.1 Existing Signals—The meaning of audio warning signals selected for a system shall be consistent with warning signal meanings already established for that function.

17.4.2 Acoustic Environment—Established signals shall be used provided they are compatible with the acoustic environment and the requirements specified herein for the voice communication system. Standard signals shall not be used to convey new meanings. See 17.1.

17.5 Masking:

17.5.1 Other Critical Channels—Audio warning signals shall not interfere with any other critical functions or signals or mask any other critical audio signals.

17.5.2 Separate Channels—Where a warning signal delivered to a headset might mask another essential audio signal, separate channels may be provided to direct the warning signal to one ear and the other essential audio signal to the other ear.

18. Verbal Warning Signals

18.1 Nature of Signals—Verbal warning signals shall consist of the following:

18.1.1 An initial alerting signal (nonspeech) to attract attention and to designate the general problem.

18.1.2 A brief standardized speech signal (verbal message) that identifies the specific condition and suggests appropriate action.

18.2 Intensity—Verbal alarms for critical functions shall be at least 20 dB above the speech interference level at the operating position of the intended receiver.

18.3 Vocal Criteria:

18.3.1 Type of Voice—The voice used in recording verbal warning signals shall be distinctive.

18.3.2 Delivery Style—Verbal warning signals shall be presented in a formal, impersonal manner.

18.4 Message Content—In selecting words to be used in audio warning signals, priority shall be given to intelligibility, aptness, and conciseness in that order.

18.5 Message Categories:

18.5.1 Critical Warning Signals—Critical warning signals shall be repeated with not more than a 3-s pause between messages until the condition is corrected or overridden by the crew.

18.5.2 Message Priorities—A message priority system shall be established, and more critical messages shall override the presentation of any message occurring below it on the priority list. If two or more incidents or malfunctions occur simultaneously, the message having the higher priority shall be given first. The remaining messages shall follow in order of priority.

In the event of a complete subsystem failure, the system shall integrate previous messages via electronic gating and report the system rather than the component failure.

19. Controls for Audio Warning and Caution Devices

19.1 Automatic or Manual Shutoff—When an audio signal is designed to persist as long as it contributes useful information, a shutoff switch controllable by the operator, the sensing mechanism, or both, shall be provided, depending on the operational situation and personnel safety factors.

19.2 Automatic Reset—Whether audio and caution warning signals are designed to be terminated automatically, by manual control, or both, an automatic reset function shall be provided. The automatic reset function shall be controlled by the sensing mechanism which shall recycle the signal system to a specified condition as a function of time or the state of the signal system.

19.3 Redundant Visual Warning—All nonverbal aural announcements shall be accompanied by a visual announcement which defines the condition. This may be an illuminated display.

19.4 Volume Control:

19.4.1 Automatic or Manual—The volume (loudness) of an audio warning or caution signal shall be designed to be controlled by the operator, the sensing mechanism, or both, depending on the operational situation and personnel safety factors. Control movements shall be restricted to prevent reducing the volume to an inaudible level but in no case shall the volume be less than that of 20 dB.

19.4.2 Ganging to Mode Switches—Volume controls may be ganged to mode switches to provide maximum output during mission phases in which intense noise may occur and to provide reduced volume at other times. Ganging shall not be accomplished if there is a possibility that intense noise may occur in an emergency situation during a mission phase in which the volume would be decreased below an audiable level.

19.4.3 Caution Signal Controls—Audio caution signals shall be provided with manual reset and volume controls.

19.5 Duration—Audio warning and caution signals shall continue until the appropriate operator response is made, alarm acknowledged, or malfunction corrected. Completion of a corrective action by the operator or by other means shall automatically terminate the signal.

19.6 Duration Limitations—In an emergency situation, signals that persist or increase progressively in level shall not be used if manual shutoff may interfere with the corrective action required.

20. Speech Transmission Equipment

20.1 Frequency—Microphones and associated system-input devices shall be designed to respond optimally to that part of the speech spectrum most essential to intelligibility (200 to 6100 Hz). Where system engineering necessitates speech-transmission bandwidths narrower than 200 to 6100 Hz, the minimum acceptable frequency range shall be 250 to 4000 Hz.

20.2 Dynamic Range—The dynamic range of a microphone used with a selected amplifier shall be great enough to admit variations in signal input of at least 50 dB.
20.3 **Noise-Cancelling Microphones**—In very loud, low-frequency noise environments (100 dB overall), noise-cancelling microphones shall be used and shall be capable of effecting an improvement of not less than 10-dB peak-speech to root-mean-square-noise ratio as compared with nonnoise-cancelling microphones of equivalent transmission characteristics.

20.4 **Preemphasis**—If necessary, speech system input devices shall use frequency preemphasis with a positive slope frequency characteristic no greater than 18 dB per octave from 140 to 1500 to and no greater than 9 dB per octave over the frequency range 1500 to 4800 Hz, when no clipping is used.

20.5 **Peak Clipping of Speech Signals**—Where speech signals are to be transmitted over channels showing less than 15 dB, peak-speech to root-mean-square-noise ratios, peak clipping of 12 to 20 dB may be used at system input and may be preceded by frequency preemphasis.

20.6 **Noise Shields**—When the talker is in an intense noise field, the microphone shall be put in a noise shield. Noise shields shall be designed to meet the following requirements:

20.6.1 A volume of at least 250 cm³ (15.25 in.³) to permit a pressure gradient microphone to function normally.

20.6.2 A good seal against the face with the pressure of the hand or the tension of straps.

20.6.3 A hole or combination of holes covering a total area of 65 mm² (0.1 in.²) in the shield to prevent pressure buildup.

20.6.4 Prevention of a standing wave pattern by shape or by use of sound-absorbing material.

20.6.5 No impediment to voice effort, mouth or jaw movement, or breathing.

20.7 **Speech Reception Equipment**:

20.7.1 **Frequency Range**—Headphones and loudspeakers shall be subject to the same frequency response restrictions as microphones and transmission equipment, except that loudspeakers for use in multispeaker installations and multiple channels fed into headphones (for example, where several speech channels are to be monitored simultaneously) shall respond uniformly (+5 dB) over the range 100 to 4800 Hz.

20.7.2 **Loudspeakers for Multichannel Monitoring**:

20.7.2.1 **Monitoring of Speakers**—When several channels are to be monitored simultaneously by means of loudspeakers, the speakers shall be mounted at least 175 mrad (10°) apart in the horizontal plane frontonal quadrant, ranging radially from 788 mrad (45°) left to 788 mrad (45°) right of the operator’s normal forward facing position. Loudspeakers used by a single person (in an area in which there is more than one speaker installed) shall be mounted directly in front of the user and be equipped with a volume control and a jack box for use with headphones.

20.7.2.2 **Filtering**—When additional channel differentiation is required, apparent lateral separation shall be enhanced by applying low-pass filtering (frequency cutoff, \( F_c = 1800 \text{ Hz} \)) to signals fed to loudspeakers on one side of the central operator position. If there are three channels involved, one channel shall be left unfiltered, a high-pass filter with 1000-Hz cutoff shall be provided in the second channel, and a low-pass filter with 2500-Hz cutoff shall be provided in the third channel. A visual signal shall be provided to show which channel is in use.

20.7.3 **Use of Deemphasis**—When transmission equipment uses preemphasis and peak clipping is not used, reception equipment shall use frequency deemphasis of characteristics complementary to those of preemphasis only if it improves intelligibility, that is, deemphasis shall be a negative-slope frequency response not greater than 9 dB per octave over the frequency range 140 to 4800 Hz.

20.7.4 **Headsets**—If listeners will be working in high ambient noise (85 dB(A) or above), binaural rather than monaural headsets shall be provided. Unless operational requirements dictate otherwise, binaural headsets shall be wired so that the sound reaches the two ears in opposing phases. Their attenuation qualities shall be capable of reducing the ambient noise level to less than 85 dB(A). Provisions shall be incorporated to furnish the same protection to those who wear eyeglasses.

20.8 **Operator Comfort and Convenience**:

20.8.1 **Comfort**—Headphones and telephone headsets shall be designed for operator comfort, and no metal parts of the headset shall come in contact with the user’s skin.

20.8.2 **Hands-Free Operation**—Operator microphones, headphones, and telephone headsets shall be designed to permit hands-free operation under normal working conditions.

20.8.3 **Accessibility of Headsets**—Where communication requirements necessitate the use of several telephone headsets, the accessibility of their standby locations shall be determined by operational priority, that is, the most frequently or urgently needed headset shall be the most accessible. Color coding may also be used where operating personnel will have visual contact with headsets under the working conditions.

20.9 **Operating Controls for Voice Communication Equipment**:

20.9.1 **Volume Controls**—Accessible volume or gain controls shall be provided for each communication receiving channel (for example, loudspeakers or headphones) with sufficient electrical power to drive sound pressure level to at least 110 dB overall when using two earphones. The minimum setting of the volume control shall be limited to an audible level, that is, it shall not be possible to disable the system inadvertently with the volume control. While separation of power (on-off) and volume control adjustment functions into a separation of power (on-off) and volume control adjustment functions into separate controls is preferred, shall conditions justify their combination, a noticeable detente position shall be provided between the OFF position and the lower end of the continuous range of volume adjustment. When combined power and volume controls are used, the OFF position shall be labeled.

20.9.2 **Squelch Control**—Where communication channels are to be continuously monitored, each channel shall be provided with a signal-activated switching device (squelch control) to suppress channel noise during no-signal periods. A manually operated, on-off switch to deactivate the squelch when receiving weak signals shall be provided.

20.9.3 **Foot-Operated Controls**—When normal working conditions will permit the operator to remain seated at the working position and access to “talk-listen” or “send-receive” control switches are required for normal operation, or if console operation requires the use of both hands, foot-operated
controls shall be provided. Hand-operated controls for the same functions shall be provided for emergency use and for use when the operator may need to move from one position to another.

20.10 Speaker/Side Tone—The speaker’s verbal input shall be in phase with its reproduction as heard on the headset. This side tone shall not be filtered or modified before it is received in the headset.

20.11 Speech Intelligibility:

20.11.1 General—When information concerning the speech intelligibility of a system is required, three recommended methods are available, with the appropriate selection being dependent upon the requirements of the test.

20.11.1.1 The ANSI standard method of measurement of phonetically balanced (PB) monosyllabic word intelligibility, S3.2-1960, shall be used when a high degree of test sensitivity and accuracy is required.

20.11.1.2 The Modified Rhyme Test (MRT) shall be used if the test requirements are not as stringent or if time and training do not permit the use of the ANSI method.

20.11.1.3 The Articulation Index (AI) calculations should be used for estimations, comparison and predictions of system intelligibility based upon ANSI S3.5-1969.

20.11.2 Criteria—The intelligibility criteria shown in Table 8 shall be used for voice communication. The efficiency of communications needed and the type of material to be transmitted shall determine which of the three communication requirements of Table 8 is to be selected.

21. Controls, General Information

21.1 Selection Criteria—Criteria in Table 9 and Table 10 should be used in determining the type of control to be used on control panels or other applications where controls are required.

21.2 Users—The type of control selected and the location of the motion envelope provided for control operation shall ensure that suitably clothed and equipped user personnel with applicable fifth through ninety-fifth percentile body dimensions and fifth percentile strength can operate them.

21.3 Efficiency—Since more operations are right handed than left handed, equipment shall normally be designed for right-handed operation. Other considerations are that hand manipulation is more precise than foot manipulation and that more force can usually be applied by the foot and leg than the hand and arm.

21.4 Distribution of Work Load—Controls shall be selected and distributed so that none of the operator’s limbs will be overburdened.

21.5 G-loading—Where applicable, control selection shall include consideration of operation under variable g-loading on the operator.

21.6 Multirotation Controls—Multirotation controls shall be used when precision is required over a wide range of adjustment.

21.7 Detente Controls—Detente controls shall be selected whenever the operational mode requires control operation in discrete steps.

21.8 Stops—Stops shall be provided at the beginning and end of the range of control positions if the control is not required to be operated beyond the indicated end positions or specified limits.

21.9 Direction of Movement:

21.9.1 Consistency of Movement—Direction of control movement shall be consistent with the related movement of an associated display, equipment component, or vessel (see Table 11 and Fig. 19). With the exception of valve controls, movement of a control forward, clockwise to the right, or up, or pressing a control, shall turn the equipment or component on, cause the quantity to increase, or cause the equipment or component to move forward, clockwise, to the right, or up.

21.9.2 Multidimensional Operation—When the vessel, the equipment, or the components are capable of motion in more than two dimensions, exception to Section 21.9.1 (Consistency of Movement) may be necessary to ensure consistency or anticipated response (such as forward motion of a directional control causes some vessels to dive, for example, a submarine, or otherwise descend rather than to simply move forward). When several controls are combined in one control device, caution shall be exercised to avoid conflicts (for example, control motion to the right is compatible with clockwise roll, right turn, and direct movement to the right).

21.9.3 Operator-Control Orientation—Controls shall be oriented with respect to the operator. Where the operator may use two or more vehicle operator stations, the controls shall cause movement oriented to the operator at the effecting station, unless remote visual reference is used.

21.9.4 Valve Controls—Rotary valve controls shall open the valve with a counterclockwise motion and close with a clockwise rotation. Valve controls shall be provided with double-ended arrows labeled OPEN in the counter-clockwise direction and CLOSE in the clockwise direction.

22. Arrangement and Grouping of Controls

22.1 Grouping—All controls that function in sequential operational necessary to a particular task, or that operate together, shall be grouped together along with their associated displays. When several steps of a sequence are selected by one control, the steps shall be arranged by order of occurrence to minimize control movements and event cycling through unnecessary steps. Cycling through the control’s ON/OFF position shall be avoided.

22.2 Sequential Operation—Where sequential operations follow a fixed pattern, controls shall be arranged to facilitate
22.3 Location of Primary Controls—The most important and frequently used controls shall have the most favorable position with respect to ease of reaching and grasping (particularly rotary controls and those requiring fine settings).

22.4 Consistency—The arrangement of functionally similar or identical controls shall be consistent from panel to panel throughout the system, equipment, or vessel.

22.5 Remote Controls—Where controls are operated at a position remote from the display, equipment, or controlled vessel, they shall be arranged to facilitate direction-of-movement consistency.

22.6 Maintenance and Adjustment—In general, controls used solely for maintenance and adjustment shall be covered during normal equipment operation, but shall be directly accessible and visible to the maintenance technician when required.

22.7 Spacing—Minimum spacing between control shall comply with Table 12 spacing between a control and any adjacent obstruction shall be as shown by the figures referenced by Table 12. Minimum spacing shown shall be increased for operation with gloves, mittens, NBC, or other protective handwear when such operation is a system requirement.
23. Coding of Controls

23.1 Methods and Requirements—The use of a coding mode such as size and color for a particular application shall be governed by the relative advantages and disadvantages of each type of coding. Where coding is used to differentiate among controls, application of the code shall be uniform throughout the system. (See Table 13 for advantages and disadvantages.)

23.2 Location Coding—Controls associated with similar functions shall be in the same relative location from operator work station to work station and from panel to panel.

23.3 Size Coding—No more than three different sizes of controls shall be used in coding controls for discrimination by absolute size. Controls used for performing the same function on different items of equipment shall be the same size. When knob diameter is used as the coding parameter, differences between diameters shall not be less than 13 mm (0.5 in.). When knob thickness is the coding parameter, differences between thicknesses shall not be less than 10 mm (0.4 in.).

23.4 Shape Coding—Primary use of shape coding for controls is for identification of control knobs or handles by “feel;” however, shapes shall be identifiable both visually and tactually. When shape coding is used:

23.4.1 The coded feature shall not interfere with ease of control manipulation.

23.4.2 Shapes shall be identifiable by the hand regardless of the position and orientation of the control knob or handle.

23.4.3 Shapes shall be tactually identifiable when gloves are worn, where applicable.

23.4.4 A sufficient number of identifiable shapes shall be provided to cover the expected number of controls that require tactile identification.

23.4.5 Shape-coded knobs and handles shall be positively and nonreversibly attached to their shafts to preclude incorrect attachment when replacement is required.

23.4.6 Where possible, control shapes shall resemble the equipment, system, or control function that the control operates.

23.4.7 Color Coding:

23.4.7.1 Lighting—Color coding of control surfaces shall not be used when visibility of the controls is restricted or obstructed, or when illumination lighting is below 0.35 cd/m² (0.1 ft-L) or of some color other than white.

23.4.7.2 Related Controls—When related controls and displays are color coded, they shall be coded the same color.

23.4.7.3 Emergency Controls—All emergency controls used under only white lighting shall be colored red. If red lighting is to be used during any portion of a mission, controls which would have been coded red shall be coded by orange-yellow and black striping. To give emergency controls visual emphasis, color coding of other controls shall be kept to a minimum.

23.4.7.4 Choice of Colors—Controls shall be black (17038, 27038, or 37038) or gray (26231 or 36231). If color coding is required, the following colors identified in Table 14 shall be selected for control coding.

23.4.7.5 Relation to Display—When color coding must be used to relate a control to its corresponding display, the same color shall be used for both the control and the display.

23.4.7.6 Control Panel Contrast—The color of the control shall provide contrast between the panel background and the control.

23.4.7.7 Ambient Lighting and Color-Coding Exclusion—Color coding shall be compatible with anticipated ambient lighting throughout the mission. Color coding shall not be used as a primary identification medium if the operator’s adaptation to that light, varies as the result of such factors as solar glare, filtration of light, and variation from natural to artificial light.

23.5 Labeling of Controls—Control labeling shall conform to the criteria in 29.7.

23.6 Compatibility with Handwear—Controls shall be compatible with handwear to be used in the anticipated environment. Unless otherwise specified, all dimensions cited herein are for bare hands and shall be revised where necessary for use with gloves or mittens.

23.7 Blind Operation—Where “blind” operation is necessary, hand controls shall be shape coded or separated from adjacent controls by at least 125 mm (5 in.).

23.8 Prevention of Accidental Actuation:

23.8.1 Location and Design—Controls shall be designed and located so that they are not susceptible to being moved accidentally, particularly critical or emergency controls whose inadvertent operation might cause damage to equipment, injury to personnel, or degradation of system functions.

23.8.2 Internal Controls—Internal or hidden controls shall be protected, because it is usually not obvious that such controls have been disturbed and it may be difficult and time consuming to locate and readjust them.

23.8.3 Rapid Operation—Any method of protecting a control from inadvertent operation shall not preclude operation within the time required.

23.8.4 Methods—For situations in which controls must be protected from accidental actuation, one or more of the following methods, as applicable, shall be used:

23.8.4.1 Locate and orient the controls so that the operator is not likely to strike or move them accidentally in the normal sequence of control movements.

23.8.4.2 Recess, shield, or otherwise surround the controls by physical barriers. The control shall be entirely contained within the envelope described by the recess or barrier.
FIG. 19 Control Motion Expectancy

A - CEILING
B - 45° PANEL
C - FRONT PANEL
D - DESK / CONSOLE SURFACE
E - UNDER CONSOLE
F - LEFT PANEL
G - RIGHT PANEL
23.8.4.3 Cover or guard the controls. Safety or lock wire shall not be used.

23.8.4.4 Provide the controls with interlocks so that extra movement (for example, a side movement out of a detente position or a pull-to-engage clutch) or the prior operation of a related or locking control is required.

23.8.4.5 Provide the controls with resistance (that is, viscous or coulomb friction, spring loading, or inertia) so that definite or sustained effort is required for actuation.

23.8.4.6 Provide the controls with a lock to prevent the control from passing through a position without delay when strict sequential activation is necessary (that is, the control moved only to the next position, then delayed).

23.8.4.7 Design the controls for operation by rotary action.

23.8.5 Dead Man Controls—Dead man controls, which will result in system shutdown to a noncritical operating state when force is removed, shall be used wherever operator incapacity can produce a critical system condition.

23.9 Foot-Operated Controls:

23.9.1 Use—Foot-operated controls may be used under the following conditions:

23.9.1.1 Control operation requires either greater force than the upper body can provide or force close to an upper body fatigue threshold.

23.9.1.2 The operator’s hands are generally occupied by other manual control tasks at the same moment that an additional control action is required.

23.9.1.3 A safety shutdown control is required during an operation in which the operator’s hands cannot be freed to reach a safety switch.

23.9.2 Avoidance—Foot-operated controls shall not be used under the following conditions:

23.9.2.1 Where a standing operator is confronted with a sensitive balancing requirement (for example, a moving platform where balancing on the nonoperating foot may become difficult as the operating foot is moved from a support to actuating position).

23.9.2.2 Precise control operations are required.

23.9.2.3 Selection from among a great many separate controls is required.

23.9.3 Operation—Foot controls shall be located and designed so they can be operated in as natural a pattern as practicable. Specifically, the following shall be avoided:

23.9.3.1 Frequent, maximum reaching.

23.9.3.2 Requirement to hold the leg or foot in awkward position for extended periods of time.

\(^A\) All values are for one hand operation. Distances are measured from edge to edge of each control.

\(^B\) For pushbuttons not separated by barriers.
23.9.3.3 Requirement for the operator to operate a control frequently or for an extended period of time while sitting in a twisted position, the pedals shall be laid out symmetrically with reference to the operator’s principal operating orientation.

23.9.3.4 Maximum force application frequently or for extended duration.

23.9.3.5 Requirement that the operator search for a particular foot control in order to select the proper one.

23.9.3.6 Placement of a foot control where it might be stepped on and inadvertently actuated or where typical shifting from one foot control to another creates conditions where the foot or clothing might be entrapped by an intervening control.

23.9.4 Configuration and Placement—Configuration and placement of foot operated controls shall accommodate the anthropometry of the operator’s foot wearing operational shoes or boots (See Section 30). They shall be located so that the activation of a control by one foot does not interfere with the activation of a control by another foot and so that the movements of feet and legs are natural and easily accomplished within the work station where foot controls are located.

23.9.5 Foot-Operated Switches:

23.9.5.1 Use—Foot-operated switches shall be used only where the operator is likely to have both hands occupied when switch activation may be required, or when load sharing among limbs is desirable. Because foot-operated switches are susceptible to accidental activation, their uses shall be limited to noncritical or infrequent operations such as press-to-talk communication or vehicle headlight dimming.

23.9.5.2 Operation—Foot switches shall be positioned for operation by the toe and the ball of the foot rather than by the heel. They shall not be located so near an obstruction that the operator cannot center the ball of the foot on the switch button. A pedal may be used over the button to aid in location and operation of the switch. When the switch may become wet and slippery, the switchcap surface shall possess a frictional surface to minimize the possibility of the foot slipping off the switch.

23.9.5.3 Dimensions, Resistance, and Displacement—Dimensions, resistance, and displacement of foot-operated switches shall conform to the criteria in Fig. 20. Although not recommended (only one switch per foot is preferred), when one foot is required to operate more than one switch, such switches shall be at least 75 mm (3 in.) apart (horizontal); 200 mm (8 in.) vertically.

</tr>
</tbody>
</table>

23.9.5.4 Feedback—A positive indication of control activation shall be provided (for example, snap feel, audible click, association visual, or auditory display).

23.10 Foot Pedals:

23.10.1 Use—Pedal controls shall be used only when the operator is likely to have both hands occupied when control operation is required or control system force is too high for manual force capability of the operator, or standardized use of pedals has created a stereotype expectancy (for example, vehicle pedal control configurations such as clutch, brake, accelerator, rudder).

23.10.2 Location—Pedal controls shall be located so that the operator can reach them easily without extreme stretching or torso twisting and can reach the maximally displaced pedals within anthropometric limits and force capabilities (see Fig. 21). Pedals that may be held or must be adjusted shall be located so the operator can “rest” and “steady” the foot, that is, the pedal shall be appropriate critical distance above the floor so the operator’s heel can rest on the floor while articulating the ankle/foot. When this cannot be done (and the pedal angle is more than 350 mrad (20°) from the horizontal floor), a heel rest shall be provided. Lateral spacing of individual pedals shall conform to criteria in Fig. 22. However, the overall array shall not exceed 760 mm (29 in.) as measured between the outermost pedal centerlines.

23.10.3 Control Return—Except for controls that generate a continuous output (for example, rudder controls), pedals shall return to the original null position without requiring assistance from the operator (for example, brake pedal). For pedals in which the operator may normally rest the foot on the control between operations, sufficient resistance shall be provided to prevent the weight of the foot from inadvertently actuating the control (for example, accelerator pedal).

23.10.4 Pedal Travel Path—The travel path shall be compatible with the natural articulation path of the operator’s limbs (that is, thigh, knee, ankle).

23.10.5 High-Force Application Aids—When foot controls requiring high control forces are to be used, the push force push exerted by the leg depends on the thigh angle and the knee angle. Fig. 23 specifies the mean maximum push at various knee and thigh angles. The maximum push is at about the 160° angle, referred to as the limiting angle of Fig. 23 apply to males only and shall be corrected for females. (Two thirds of each value is considered to be a reasonable value for females.) Appropriate aids shall be provided to assist the operator in applying maximum force including the following where applicable:

23.10.5.1 Seat backrest.

23.10.5.2 Optimized seat height-to-pedal and normal reach distance for maximum force, the seat reference point (SRP), and pedal are at the same vertical height.

23.10.5.3 Double-width pedal so that both feet can be used.

23.10.6 Non-slip Pedal Surface—Pedals used for high force applications shall be provided with a non-skid surface. Similar surfaces are desirable for all pedals.

23.10.7 Dimensions, Resistance, Displacement, and Separation—Dimensions, resistance, displacement, and separation of pedals shall conform to the criteria of Fig. 21.
23.10.8 Foot Controls Force (High)—Where foot controls requiring high control forces are to be used, the force push exerted by the leg depends on the thigh angle and knee angle. Fig. 23 specifies the mean maximum push at various knee and thigh angles. The maximum push is about the 160° angle, referred to as the limiting angle. The values of Fig. 23 apply to males only and shall be corrected for females. For females, use two thirds of the male value.
24. Rotary Controls

24.1 Discrete Rotary Controls:

24.1.1 Rotary Selector Switches—Rotary selector switches shall be used for discrete functions when three or more detented positions are required. Rotary selector switches shall not be used for a two-position function unless prompt visual identification of control position is of primary importance and speed of control operation is not critical.
24.1.2 Moving Pointer—Rotary selector switches shall be designed with a moving pointer and a fixed scale.

24.1.3 Shape—Moving pointer knobs shall be bar shaped, with parallel sides, and the index end shall be tapered to a
point. Exceptions may be justified when pointer knobs are shape coded or when space is restricted and torque is light. Shape coding shall be used when a group of rotary controls, used for different functions, is placed on the same panel and control confusion might otherwise result.

24.1.4 Positions—A rotary selector switch that is not visible to the operator during normal system operation shall have no more than 12 positions. A rotary switch that is constantly visible to the operator shall have not more than 24 positions. Recommended switch setting parameters are provided in Fig. 24. In addition, the following criteria shall apply:

24.1.4.1 Rotary switch positions shall not be placed opposite each other unless knob shape precludes confusion as to which end of the knob is the pointer.

<table>
<thead>
<tr>
<th>APPLICATION CRITERIA</th>
<th>DIMENSIONS</th>
<th>DISPLACEMENT</th>
<th>SEPARATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preferred for accurate identification of knob position by feel, control panels where high-force switches are not required, skirt optional</td>
<td>L = 38 mm to 100 mm (1 1/2 in to 3 1/2 in) if gloves are worn, add 13 mm (1/2 in)</td>
<td>H = 12 mm to 75 mm (1/2 in to 3 in)</td>
<td>MIN = 15° MIN, POS n ID = 30°, MAX = 60° for blind positioning, 90° for simultaneous operation of adjacent knobs (two hands); add 25 mm (1 in) for gloves</td>
</tr>
</tbody>
</table>

![Diagram of rotary selector controls](image)

**FIG. 24 Rotary Selector Controls**

43
24.1.4.2 The switch resistance shall be elastic, building up, then decreasing as each position is approached, so that the control snaps into position without stopping between adjacent positions.

24.1.4.3 Mechanical detentes shall be provided as the switch cannot be positioned in between nominal switch positions.

24.1.4.4 Stops shall be provided at the beginning and end of the range of control positions if the switch is not required to be operated beyond the end positions or specified limits (that is, if the switch is not a multirotation control, see 21.6).

24.1.5 Contrast—A reference line shall be provided on rotary switch controls. This line shall have at least 75% lumino contrast with the control color under all lighting conditions.

24.1.6 Parallax—The knob pointer shall be mounted sufficiently close to its scale to minimize parallax between the pointer and the scale markings. When viewed from the normal operator’s position, the parallax error shall not exceed 25% of the distance between scale markings.

24.1.7 Dimensions, Resistance, Displacement, and Separation—Rotary control dimensions, switch displacement, and control separation shall conform to criteria in Fig. 24 and Fig. 25.

24.1.8 Torque for Actuation—Actuating torque requirements shall be compatible with control knob sizes, that is, knob dimensions of 25 mm (1 in.) or less shall not require a torque of more than 350 N/m (Newton per metre) (2 lb-in) (pounds force per inch). Medium-sized knobs, 25 to 50 mm (1 to 2 in.), shall have a torque of less than 1050 N/m (6 lb-in). The larger knobs, diameters of 75 mm (3 in.), shall not require an actuation torque greater than 1576 M/m (9 lb-in).

24.2 Key-Operated Switches (KOS)—KOS are used to prevent unauthorized operation. Ordinarily, they control system operation by go no-go.

24.2.1 Dimensions, Displacement, and Resistance—Dimensions, displacement, and resistance shall conform to the criteria in Fig. 26 and Fig. 27.

24.2.2 Color, Shape, and Size Coding—Color, shape, or size coding or a combination may be used as follows:

24.2.2.1 Color may be used to aid in identifying various keys by function or use location and when illumination is adequate to differentiate the colors. Red shall be reserved for emergency functions.

24.2.2.2 Shape coding may be used when it is desirable to identify a given key by feel. When shape coding is used, sharp corners shall be avoided.

24.2.2.3 Size coding may be used as a valid discriminator such as shape if there are only two keys.

24.2.3 Marking and Labeling—Keylock switch applications shall include appropriate positional markings and labels (see Section 28).

24.2.4 Other Requirements:

24.2.4.1 Keys with teeth on both edges, which fit the lock with either side up or forward, are preferred.

24.2.4.2 Keys with a single row of teeth shall be inserted into the lock with the teeth pointing up or forward.

24.2.4.3 Locks shall be oriented so the key’s vertical position is the OFF position.

24.2.4.4 Operators shall normally not be able to remove the key from the lock unless the switch is turned OFF.

24.2.4.5 Activation of an item by a key-operated switch shall be accomplished by turning the key clockwise from the vertical OFF position.

24.3 Discrete Thumbwheel Controls—Thumbwheel controls may be used if the function requires a compact digital control-input device (for a series of numbers) and a readout of these manual inputs for verification. The use of thumbwheels for any other purpose is discouraged. Detente indexing units shall provide ten positions (0 to 9) in digital or binary (three or four bits and complement) outputs.

24.3.1 Shape—Each position around the circumference of a discrete thumbwheel shall have a concave surface or shall be separated by a high-friction area which is raised from the periphery of the thumbwheel. The thumbwheels shall not preclude viewing the digits within 30° viewing angle to the left and right of a perpendicular to the thumbwheel digits.

24.3.2 Coding—Thumbwheel controls may be coded by location, labeling, and color (for example, reversing the colors of the least significant digit wheel as on typical odometers). Where used as input devices, thumbwheel switch OFF or NORMAL positions shall be color coded to permit a visual check that the digits have been reset to their normal position.

24.3.3 Direction of Movement—Moving the thumbwheel edge forward, or upward, or to the right shall increase the setting (see Fig. 28).

24.3.4 Internal Illuminance of Numerals—For areas in which ambient illumination will provide display brightness below 3.5 cd/m² (1 ft-L), the thumbwheel shall be internally illuminated. Digits shall appear as light- or white-illuminated characters on a black background, and their dimensions shall approximate the following:

24.3.4.1 Height, 4.8 mm (5/16 in.).

24.3.4.2 Height-to-width ratio, 3:2.

24.3.4.3 Height-to-stroke width ratio, 10:1.

24.3.5 External Illuminance of Numerals—In areas in which ambient illumination will provide a display luminance above 3.5 cd/m² (1 ft-L), internal illumination is not required. Digits shall be bold, black numerals engraved on a light (or white) thumbwheel background. The dimensions shall approximate those specified in 24.3.4, except that the height-to-stroke width ratio shall be approximately 5:1.

24.3.6 Visibility—Thumbwheel design shall permit viewing of inline digital readout from all operator positions.

24.3.7 Dimensions—Control dimensions shall conform to the criteria in Fig. 29.

24.3.8 Resistance—Detentes shall be provided for discrete position thumbwheels. Resistance shall be elastic, building up and then decreasing as each detente is approached so that the control snaps into position without stopping between adjacent detentes. The resistance shall be within the limits indicated in Fig. 29.

24.3.9 Separation—The separation between adjacent edges of thumbwheel controls shall conform to the criteria in Fig. 29.
and shall be sufficient to preclude accidental activation of adjacent controls during normal setting.

24.4 Continuous Adjustment Rotary Controls:

24.4.1 Knobs—Knobs shall be used when low forces or precise adjustments of a continuous variable are required. A moving knob with fixed scale is preferred over a moving scale
24.4.2 Dimensions, Torque, and Separation—The dimensions of knobs shall be within the limits specified in Fig. 30. Within these ranges, knob size is relatively unimportant, provided the resistance is low and the knob can be easily grasped and manipulated. When panel space is extremely limited, knobs shall approximate the minimum values and shall have resistance as low as possible without permitting the setting to be changed by vibrations or by merely touching the control. Resistance and separation between adjacent edges of knobs shall conform to Fig. 30.

24.4.3 Shapes—Knobs that perform the same function shall have the same shape. The shape shall be determined by the knob's function and use. Representative knob shapes are shown in Fig. 31.

24.4.4 Tactual (Touch) Recognition—For knobs that must be recognized by touch alone, use easily recognizable knob shapes as shown in Fig. 32. Some sets of knobs have been specially developed and validated experimentally for tactual recognition.

24.4.5 Ganged Control Knobs—Ganged knob assemblies may be used in limited applications when panel space is at a premium. Two-knob assemblies are preferred. Three-knob configurations shall be avoided. Ganged knob configurations shall not be used under the following conditions:

<table>

* Practical for carrying key in pocket.
** When locks are new.

FIG. 26 Keylock Criteria

with fixed index for most tasks. If positions of single revolution controls must be distinguished, a pointer or marker shall be available on the knob.

24.4.5.1 Extremely accurate or rapid operations are required.
24.4.5.2 Frequent changes are necessary.
24.4.5.3 Heavy gloves must be worn by the operator.
24.4.5.4 Equipment is exposed to the weather or used under field conditions.

24.4.6 Dimensions, Torque, and Separation—Dimensions, torque, and separation shall conform to Fig. 33.

24.4.7 Shapes—Knobs that perform the same function shall have the same shape. The shape shall be determined by the knob’s function and use. Representative knob shapes are shown in Fig. 31.

24.4.8 Tactual (Touch) Recognition—For knobs that must be recognized by touch alone, use easily recognizable knob shapes (Fig. 32).

24.4.9 Knob Serration—Knobs shall be serrated. Fine serrations shall be used on precise adjustment knobs; coarse serrations shall be used on gross adjustment knobs.

24.4.10 Marking—An indexing mark or pointer shall be provided on each knob. Marks or pointers shall differ sufficiently to make it apparent which knob indexing mark is being observed.

24.4.11 Detentes—Knob detentes placement shall conform to Table 15.

24.4.12 Knob/Display Relationship—When each knob of a ganged assembly must be related to an array of visual displays,
FIG. 27 Keylock Switch Criteria

Note 1 - Switchlocks should generally be oriented so that the pivotal off key position is vertical or forward, or both (for example, horizontal panel).

Note 2 - Key displacement between functional positions should be at least 0.53 rad (30°). Mechanical detents should preclude positioning the key in between designated positions.

Note 3 - When only two functional positions occur (that is, on-off), displacement between the two positions shall be 1.57 rad (90°).

Note 4 - Total displacement of multi-position keyswitches shall not exceed 2.09 rad (120°).

FIG. 28 Thumbwheel Orientation and Movement
the knob closest to the panel shall relate to the left-most display in a horizontal array, or the uppermost display in a vertical array.

24.4.13 Inadvertent Operation—When it is critical to prevent inadvertent actuation of one knob as the other is being adjusted, a secondary knob control movement shall be required (for example, pressing the top knob before it can be engaged with its control shaft). Where inadvertent movement is undesirable but not necessarily critical, knob diameter/depth relationships shall be optimized as shown in Fig. 33. Contrasting colors between knobs may also be used to improve individual knob identification.

24.4.14 Continuous Adjustment Thumbwheel Controls:

24.4.14.1 Use—Continuously adjustable thumbwheel controls may be used as an alternative to rotary knobs when the application will benefit from the compactness of the thumbwheel device.

24.4.14.2 Orientation and Movement—Thumbwheels shall be oriented and move in the directions specified in Fig. 34. If a thumbwheel is used as a continuous control that affects vehicle motion, movement of the thumbwheel forward or up shall cause the vehicle to move down or forward.

24.4.14.3 Turning Aids—The rim of the thumbwheel shall be serrated or provided with a high friction surface to aid the operator in manipulating the control.

24.4.14.4 Dimensions, Separation, and Resistance—Dimensions, separation and resistance shall conform to criteria in Fig. 34.

24.4.14.5 Labeling and Visibility—Marking and labeling shall conform to requirements herein, with respect to visibility of markings and legibility of label alphanumericics.

24.4.14.6 OFF Position—A detente shall be provided for continuous thumbwheels having an OFF position.

24.5 Cranks:

24.5.1 Use—Cranks shall be used for tasks requiring many rotations of a control, particularly where high rates or large forces are involved. For tasks involving large slowing movements, plus small, fine adjustments, a crank handle may be mounted on a knob or handwheel, with the crank for slowing and the knob or handwheel for fine adjustments. Where cranks are used for tuning, or other processes involving numerical selection, each rotation shall correspond to a multiple of 1, 10, 100, and so forth. Simultaneously operated handcranks shall be used in preference to other two-axis controllers where extreme precision is required in setting crosshairs or reticles as in map readouts or optical sighting mechanisms (as opposed to tracking). This type of control may also be used in other applications requiring x–y control provided there is no requirement for rapid or frequent operation. The gear ratio and dynamic characteristics of such cranks shall allow precise placement of the follower (for example, crosshairs) without overshooting or undershooting and successive corrective movements.

24.5.2 Grip Handle—The crank grip handle shall be designed so that it turns freely around its shaft.

24.5.3 Dimensions, Resistance, and Separation—Dimensions, resistance, and separation between adjacent swept circular areas of cranks shall conform to the criteria of Fig. 35.

24.5.4 Folding Handle—If a crank handle could become a hazard to persons passing by, or it is critical that the handle not be inadvertently displaced by being accidentally bumped, a folding handle-type control shall be used. Such a control shall be designed so that the handle is spring loaded to keep it extended in the cranking position when in use and folded when not in use.

FIG. 29 Discrete Thumbwheel Control
24.5.5 **Crank Balance**—In applications in which resistance is light, the crank shall be balanced to prevent the handle weight from turning the crank from its last setting.

24.5.6 **Positioning of Cranks**—Cranes that must be turned rapidly shall be mounted so their turning axis are between 60 and 90° from the frontal plane (Fig. 36). For standing operators, they shall be between 900 and 1200 mm (36 and 48 in.) above the floor.

24.6 **Handwheels**:

24.6.1 **Use**—Handwheels less than 152 mm (6 in.) in diameter shall be designed and located for one-handed operation. Handwheels greater than 152 mm (6 in.) shall be designed and located for two-handed operation. Handwheels designed for two-hand operation shall be used when the breakout or rotational forces are too high to be easily overcome with a one-handed control. Typical applications are steering, latch securing, valve opening/closing and direct-linkage adjustment.
24.6.2 Turning Aids—Knurling, indentation, high-friction covering, or a combination of these shall be built into the handwheel to facilitate operator grasp for applying maximum torque and to reduce the possibility of the wheel being jerked from the operator’s hands.

24.6.3 Spinner Handles—For applications in which the wheel may be rotated rapidly through several revolutions, a spinner handle may be added. Such handles shall not be used, however, if the projecting handle is vulnerable to inadvertent displacement of a critical wheel setting or if it creates a safety hazard.

24.6.4 Direction of Movement—Except for valves, handwheels shall rotate clockwise for ON or INCREASE and counterclockwise for OFF or DECREASE. The direction of motion shall be indicated on the handwheel, or immediately adjacent thereto, by means of arrow and appropriate legends. Valve handwheels shall turn counterclockwise to OPEN and clockwise to CLOSE. Direction of motion shall be indicated as stated above.

24.6.5 Dimensions, Resistance, Displacement, and Separation—Control dimensions, resistance, displacement, and separation between edges of adjacent handwheels shall conform to the criteria in Fig. 37.

24.6.6 Location—Where possible, valve handwheels shall be located as shown in Fig. 38 for valves mounted above the operators standing surface. Valve handwheels located below the standing surface (for example, below bilge deck grating), the handwheel shall be oriented parallel or perpendicular to the grating with the grasping surface of the handwheel no more than 300 mm (12 in.) below the standing surface. No valve handwheel larger than 510 mm (20 in.) in diameter shall be installed in the overhead above 1.93 m (77 in.) unless the operating force on the handwheel is less than 40 ft-lbf.

24.6.6.1 Access—Access to valve handwheels requiring one-handed operating from a bending, squatting, or standing ladder position shall not exceed the values shown in Fig. 39. Small valve handwheels installed on pipes wrapped with insulation shall be installed so there is a minimum of 50-mm (2-in.) clearance between the back of the handwheel and the insulation material. Handwheels associated with valves on strainers and filters shall be located so they are accessible with spray shields or enclosures in place. A minimum of 80-mm (3-in.) clearance on all sides of a handwheel shall be provided.

24.6.6.2 Position Indicators—Valves and handwheels equipped with mechanical position indicators shall be installed so the indicator is directly visible to the operator from the normal operating position.

24.6.6.3 Steering Wheel Shape—Except for established uses in applications in which maximum wheel deflection does not exceed ±2° (120°), all steering wheels shall be round.

25. Discrete Linear Controls

25.1 Push Buttons (Finger or Hand Operated):

25.1.1 Use—Push buttons shall be used when a control or an array of controls is needed for momentary contact or for activating a locking circuit, particularly in high-frequency-of-use situations.

25.1.2 Shape—The push-button surface shall normally be concave (indented) to fit the finger. When this is impractical, the surface shall provide a high degree of frictional resistance to prevent slipping.

25.1.3 Positive Indication—A positive indication of control activation shall be provided (snap feel, audible click, or integral light).

25.1.4 Channel or Cover Guard—A channel or cover guard shall be provided when it is imperative to prevent accidental activation of the controls. When a cover guard is in the open position, it shall not interfere with operation of the protected device or adjacent controls.

25.1.5 Dimensions, Resistance, Displacement, and Separation—Except for use of push buttons in keyboards, the control dimensions, resistance, displacement, and separation between adjacent edges of finger- or hand-operated push buttons shall conform to the criteria in Fig. 40.

25.1.6 Resistance—Single-finger, 2.8 N (10 oz) to 11 N (40 oz). Thumb or palm, 2.8 N (10 oz) to 23 N (80 oz).

25.1.7 Interlocks or Barriers—Mechanical interlocks or barriers may be used instead of the spacing required by Fig. 40.
25.1.8 **Identification/Legends**—Labels placed on the push-button face are preferred. Legends shall normally be legible with or without internal illumination. A lamp test capability or a dual lamp reliability, or both, shall be provided, except for switches using LEDs in place of incandescent lamps. Other considerations include:

25.1.8.1 No more than three lines of lettering shall normally be used on a legend plate.

25.1.8.2 Lamps shall be replaceable from the front of the panel, by hand, and the legend or cover plate shall be keyed to prevent possibility of interchanging covers.

25.2 **Keyboards**:

25.2.1 **Use**—Arrangements of push buttons in the form of keyboards shall be used when alphabetic, numeric, or special function information is to be entered into a system.

25.2.2 **Layout and Configuration**—The key configuration and the number of keys are dependent upon the predominant type of information to be entered into the system. The major forms that keyboards can take, which aid in the entry of such information, are given below:

25.2.2.1 **Numeric Keyboard**—The configuration of a keyboard used to enter solely numeric information shall be a $3 \times 3 + 1$ matrix with the zero digit entered on the bottom row and

* To and including 25 mm (1 in) diameter knobs.
** Greater than 25 mm (1 in) diameter knobs.
arranged in either of the following ways:
123 456 789 0 or 789 456 123 0

25.2.2.2 Alphanumeric Keyboard—Keyboard configurations can vary with the entry of data changing from primarily alphabetic to primarily numeric. For these applications, two alternatives are preferred: provide a keyboard where there is no separation between alphabetic and numeric characters or provide a separation to emphasize the two separate functions, with the numeric keyboard located to the right of the standard keyboard.

25.2.2.3 Dimensions, Resistance, Displacement, and Separation—The control dimensions, resistance, displacement, and separation between adjacent edges of the push buttons which form keyboards shall conform to the criteria in Table 16 and Table 17. For a given keyboard, these criteria shall be uniform for all individual keys. For those applications in which operation while wearing (trigger finger) arctic mittens is required, the minimum key size shall be 19 mm (0.75 in.). Other parameters are unchanged from those of bare-handed operation (see Table 16 and Table 17).

25.2.2.4 The slope of nonportable keyboards shall be 260 to 435 mrad (15 to 25°) from the horizontal. The preferred slope is 280 to 300 mrad (17 to 18°). The slope of a portable device can be varied according to the preference of the operator. The first row of keys shall be between 230 and 300 mm (9 and 12 in.) above the seat level.

25.2.2.5 Multiple Keyboards—Systems containing more than one keyboard shall maintain the same configuration for alphanumeric, numeric, and special function keys throughout the system.

25.2.2.6 Feedback—Feedback shall be provided to inform the operator whether the key was pressed, the intended key was pressed, and whether the next operation may be initiated.

25.3 Toggle Switch Controls:
25.3.1 Use—Toggle switches shall be used for functions that require two discrete positions or where space limitations

* Preferred. Some miniature applications may require less.
are severe. Toggle switches with three positions shall be used only where the use of a rotary control, legend switch control, and so forth, is not feasible or when the toggle switch is of the spring-loaded, center position-off type. Three position toggle switches that are spring loaded to center-off from only one other position shall not be used if release from the spring-loaded position results in switch handle travel beyond the off position. Toggle switches are considered herein to be discrete position controls. Small controls that are the same size and shape as toggle switches and used for making continuous adjustments are described herein as levers.

25.3.2 Accidental Activation—When the prevention of accidental activation is of primary importance (critical, dangerous, or hazardous conditions would result), channel guards, lift-to-unlock switches, or other equivalent prevention mechanisms shall be provided. Safety or lock wire shall not be used. Resistance of lift-to-unlock mechanisms shall not exceed 13 N.
25.4.3.4 Lamps within the legend switch shall be replaceable from the front of the panel by hand and the legends or covers shall be keyed to prevent the possibility of interchanging the legend covers.

25.4.3.5 There shall be a maximum of three lines of lettering on the legend plate.

25.5 **Rocker Switches:**

25.5.1 **Use**—Rocker switches may be used in lieu of toggle switches for functions that require two discrete positions. They may be used for applications in which toggle switch handle protrusions might snag the operator’s sleeve or phone cord or there is insufficient panel space for separate labeling of switch positions. Rocker switches with three positions shall be used only where the use of a rotary control, legend switch control, and so forth, is not feasible or when the rocker switch is of the spring-loaded center-off type.

25.5.2 **Accidental Actuation**—When the prevention of accidental actuation is of primary importance (critical, dangerous, or hazardous conditions would result), channel guards or equivalent protective measures shall be provided.

25.5.3 **Positive Indication**—An indication of control activation shall be provided (snap feel, audible click, associated or integral light).

25.5.4 **Dimensions, Resistance, Displacement, and Separation**—Dimensions, resistance, displacement, and separation between adjacent edges of rocker switches shall conform to the criteria in Fig. 43. Resistance shall gradually increase, then drop when the switch snaps into position. The switch shall not be capable of being stopped between positions. Resistance for a small switch ranges from 2.8 N (10 oz) minimum to 4.5 N (16 oz) maximum. For large switches, the forces are 2.8 N (10 oz) minimum to 11 N (40 oz) maximum.

25.5.5 **Orientation**—Rocker switches may be used in lieu of toggle switches for functions that require two discrete positions. They may be used for applications in which toggle switch handle protrusions might snag the operator’s sleeve or phone cord or there is insufficient panel space for separate labeling of switch positions. Rocker switches with three positions shall be used only where the use of a rotary control, legend switch control, and so forth, is not feasible or when the rocker switch is of the spring-loaded center-off type.

25.5.6.1 Height, 4.8 mm (1/16 in.).

25.5.6.2 Height-to-width ratio, 3:2.

25.5.6.3 Height-to-stroke-width ratio, 10:1.

25.6 **Slide Switch Controls:**

25.6.1 **Use**—Slide switch controls may be used for functions that require two discrete positions. Slide switch controls may also be used for functions that require a higher number of discrete positions in which the switches are arranged in a matrix to permit easy recognition of relative switch settings (for example, audio settings across frequencies), but shall not be used where mispositioning is to be avoided.

25.6.2 **Accidental Actuation**—When the prevention of accidental actuation is of primary importance (critical, dangerous,
or hazardous conditions would result), channel guards or other equivalent means shall be provided.

25.6.3 Dimensions, Resistance, and Separation—Dimensions, resistance, and separation of slide switch handles shall conform to criteria in Fig. 45. Detentes shall be provided for each control setting. Resistance shall gradually increase, then drop when the switch snaps into position. The switch shall not be capable of stopping between positions.

25.6.4 Orientation—Where practicable, slide switches shall be vertically oriented with movement of the slide up or away from the operator turning the equipment or component on, causing a quantity to increase, or causing the equipment or component to move forward, clockwise, to the right or up. Horizontal orientation or actuation slide switches shall be used only for compatibility with the controlled function or equipment location.

25.6.5 Positive Indication—Slide switch controls involving more than two positions shall be designed to provide positive indication of control setting, preferably a pointer located on the left side of the slide handle.

25.7 Discrete Push-Pull Controls:

25.7.1 Applications—Push-pull controls may be used when two discrete functions are to be selected. However, such applications should be used sparingly. They may also be used in certain cases in which limited panel space suggests a miniaturized knob that may be used to serve two related, but distinct, functions (such as an ON-OFF/volume switch for a TV monitor). A three-position push-pull control is acceptable in isolated instances in which the criticality of inadvertent selection of the wrong position has no serious consequences.

25.7.2 Handle Dimensions, Displacement, and Clearances—Push-pull control handles shall conform to criteria in Fig. 46.

25.7.3 Rotation—Except for combination push-pull/rotate switch configurations, push-pull control handles shall be keyed to a nonrotating shaft, unless the control is to be used for a
special application (for example, the handle is rotated to disengage the brake setting). When the control system provides a combination push-pull/rotate functional operation, using a round style knob, the rim of the knob shall be serrated to denote (visually and tactually) that the knob can be rotated and to facilitate a slip-free finger grip.

25.7.4 Detentes—Mechanical detentes shall be incorporated into push-pull controls to provide tactile indication of positions.

25.7.5 Snagging and Inadvertent Contact—Use, location, and operating axis of push-pull-type controls shall preclude the possibility of the operator(s):

25.7.5.1 Bumping a control while getting into or out of position.

25.7.5.2 Snagging clothing, communication cables, or other equipment items on the control.

25.7.5.3 Inadvertently deactuating the control setting while reaching for another control.

25.7.6 Direction of Control Motion—Control direction shall be as follows:

25.7.6.1 Pull the operator for ON or actuation; push away for OFF or deactuation.

25.7.6.2 Clockwise for deactuation or increasing function of combination pull/rotary switches.

* For miniaturized applications, diameters as small as 3.2 mm (1/8 in) may be used subject to approval by the procuring activity.

FIG. 40 Pushbutton Switches
25.7.7 Resistance—Force for pulling a panel control with fingers shall be not more than 18 N (4 lbs), for pulling a T-bar with four fingers shall be not more than 45 N (10 lbs).

25.8 Printed Circuit (PC) Switch Controls:

25.8.1 Use—PC switches may be used when manual programming functions are required in systems using printed circuit boards.

25.8.2 Dimensions, Resistance, Displacement, and Separation—Dimensions, resistance, displacement, and separation between adjacent PC switch actuators shall conform to the following:

25.8.2.1 Dimensions of actuators shall be sufficiently high to permit error-free manipulation by the operator when using some commonly available stylus (for example, a pencil or a pen). The design of the actuators shall not require the use of a special tool for manipulation.

25.8.2.2 Actuator resistance shall be sufficiently high to avoid inadvertent actuation under expected use conditions. Resistance shall gradually increase, then drop when the actuator snaps into position. The actuator shall not be capable of stopping between positions.

25.8.2.3 When actuators are slide type, they shall have sufficient travel (displacement) to permit easy recognition of switch setting. At a minimum, the travel shall be twice the length of the actuator. When actuators are rocker type, the actuated wing shall be flush with the surface of the module.

25.8.2.4 Actuators shall have sufficient separation to permit error-free manipulation by the operator (the stylus cannot inadvertently contact adjacent actuators).

25.8.3 Shape—The surface of the actuator shall be indented to accept the point of the stylus. The indentation shall be sufficiently deep to avoid slippage of the stylus during manipulation.

26. Continuous Adjustment Linear Controls

26.1 Levers:

26.1.1 Use—Levers may be used when large amounts of force or displacement are involved or when multidimensional movements of controls are required.

26.1.2 Coding—When several levers are grouped in proximity to each other, the lever handles shall be coded.

26.1.3 Labeling—When practicable, all levers shall be labeled as to function and direction of motion.

26.1.4 Limb Support—When levers are used to make fine or continuous adjustments, support shall be provided for the appropriate limb segment as follows:

26.1.4.1 For large hand movements, elbow support.

26.1.4.2 For small hand movements, forearm support.

26.1.4.3 For finger movements, wrist support.

26.1.5 Dimensions—The length of levers shall be determined by the mechanical advantage needed. When the lever or grip handle is spherical, its diameter shall conform to the criteria in Fig. 47. When the levers are of the slide type, dimensions and separations shall comply with Fig. 48.

26.1.6 Resistance—The resistance incorporated in levers shall be within the limits indicated in Fig. 47 and Fig. 48 measured as linear force applied to a point on the handle.

Note 1: The right hand can supply slightly more force than the left, but the difference is not significant. The same amount of push-pull force can be applied when the control is along the median plane of the body as when it is directly in front of the arm, 180 mm (7 in.) from the median plane. When the control is placed in front of the opposite (unused) arm, only 75% as much force can be applied. When the control is 250 to 480 mm (10 to 19 in.) forward of the neutral seat reference point, twice as much push-pull force can be applied with two hands as with one-hand operation. Outside this range, two-hand operation becomes less effective.

26.1.7 Elastic Resistance—For joystick controls, elastic resistance that increases with displacement may be used to improve stick feel.

26.1.8 Displacement and Separation—Control displacement (for the seated operator) and separation shall conform to the criteria in Fig. 47.

26.2 Displacement Joysticks—(also known as Isotonic Joysticks.) Displacement joysticks usually have a spring resistance to movement away from the center (null) position, although some have no spring. Joystick controls may be used when the task requires precise or continuous control in two or more related dimensions. (The term “joystick” is used here to refer primarily to controls used for cursor placement or precise adjustment.) When positioning accuracy is more critical than...
positioning speed, displacement joysticks shall be selected over isometric joysticks. Displacement joysticks may also be used for various display functions such as data pickoff from a CRT and generation of free-drawn graphics. In rate control applications, which allow the follower (cursor or tracking symbol) to transit beyond the edge of the display, indicators shall be provided to aid the operator in bringing the follower back onto the display. Displacement joysticks that are used for rate control shall be spring loaded for return to the center when the hand is removed. Displacement joysticks that have a

FIG. 41 Toggle Switches
deadband near the center or hysteresis shall not be used with automatic sequencing of a CRT follower (cursor or tracking symbol) unless they are instrumented for null return or zero set to the instantaneous position of the stick at the time of sequencing. Upon termination of the automatic sequencing routine, joystick center shall again be registered to scope center. Displacement joysticks usually require less force than isometric joysticks and are less fatiguing for long operating periods.

26.2.1 Hand-Operated Displacement Joysticks:

26.2.1.1 Specific Use—In addition to the general use, hand-operated displacement joysticks may be used as vehicle controllers and aiming sensors. Hand-operated displacement joysticks may be used as mounting platforms for secondary controls, such as thumb- and finger-operated switches. Operation of secondary controls has less induced error on the displacement hand grip than does isometric handgrips.

26.2.1.2 Dynamic Characteristics—Movement shall not exceed 45° from the center position. Movement shall be smooth in all directions, and positioning of a follower shall be attainable without noticeable backlash, cross-coupling, or need for multiple corrective movements. Control ratios, friction, and inertia shall meet the dual requirements of rapid gross positioning and precise fine positioning. When used for generation of free-drawn graphics, the refresher rate for the follower on
the CRT shall be sufficiently high to give the appearance of a continuous track. Delay between control movement and confirming display response shall be minimized and shall not exceed 0.1 s.

26.2.1.3 Dimensions, Resistance, and Clearance—The hand grip length shall be in the range of 110 to 180 mm (4.3 to 7.1 in.). The grip diameter shall not exceed 50 mm (2 in.). Clearances of 100 mm (4 in.) to the side and 50 mm (2 in.) to the rear shall be provided to allow for hand movement. Joysticks shall be mounted to provide forearm support. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.
26.2.2 Finger-Operated Displacement Joysticks:

26.2.2.1 Specific Use—In addition to the general uses, finger-operated displacement joysticks are useful for free-drawn graphics. In this application, there is usually no spring return to center, and the resistance shall be sufficient to maintain the handle position when the hand is removed.

26.2.2.2 Dynamic Characteristics—Movement shall not exceed 45° from the center position. Movement shall be smooth in all directions, and positioning of a follower shall be attainable without noticeable backlash, cross-coupling, or need for multiple corrective movements. Control ratios, friction, and inertia shall meet the dual requirements of rapid gross positioning and precise fine positioning. Recessed mounting or pencil attachments may be used as indicated in Fig. 49 to provide greater precision of control. When used for generation of free-drawn graphics, the refresher rate for the follower on the CRT shall be sufficiently high to give the appearance of a continuous track. Delay between control movement and the confirming display response shall be minimized and shall not exceed 0.1 s.

26.2.2.3 Dimensions, Resistance, and Clearance—The joystick shall be mounted on a desk or shelf surface as shown in Fig. 49. Joysticks shall be mounted to provide forearm or wrist support. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.

26.2.3 Thumbtip/Fingertip-Operated Displacement Joysticks:

26.2.3.1 Specific Use—Thumbtip/fingertip-operated joysticks may be mounted on a handgrip, which serves as a steady rest to damp vibrations and increase precision. If so mounted, the handgrip shall not simultaneously function as a joystick controller.

26.2.3.2 Dynamic Characteristics—Movement shall not exceed 785 rad (45°) from the center position.

26.2.3.3 Dimensions, Resistance, and Clearance—Joysticks shall be mounted to provide wrist or hand support. Console mounted devices shall be mounted as shown in Fig. 49. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.

26.2.4 Isometric Joystick (Two-Axis Controllers)—Also known as stiff stick, force stick, or pressure stick. The controller has no perceptible movement, but its output is a function of force applied. Joystick controls may be used when the task requires precise or continuous control in two or more related dimensions. Isometric joysticks are particularly appropriate for applications: (1) which require precise return to center after each use; (2) in which operator feedback is primarily visual rather than tactile feedback from the control itself; and (3) where there is minimal delay and tight coupling between control and input and system reaction. Isometric sticks shall ordinarily not be used in applications in which it would be necessary for the operator to maintain a constant force on the control for a long period of time or in which there is no definitive feedback when maximum control inputs have been exceeded. Joystick controls may be used when the task requires precise or continuous control in two or more related dimensions. When positioning speed is more critical than positioning.
accuracy, isometric joysticks shall be selected over displacement joysticks. Isometric joysticks may also be used for various display functions such as data pickup from a CRT. In rate control applications, which may allow the follower (cursor or tracking symbol) to transit beyond the edge of the display, indicators shall be provided to aid the operator in bringing the follower back onto the display.

26.2.4.1 Hand Operated:

(a) Specific Use—In addition to the general use, hand-operated isometric joysticks may be used as vehicle controllers and aiming sensors. Hand-operated isometric joysticks may be used as mounting platforms for secondary controls, such as thumb- and finger-operated switches. Operation of secondary controls has greater induced error on the isometric hand grip than does displacement handgrip joysticks.

(b) Dynamic Characteristics—Maximum force for full output shall not exceed 118 N (26.7 lbs).

(c) Dimensions, Resistance, and Clearance—The hand grip length shall be in the range of 110 to 180 mm (4.3 to 7.1 in.). The grip diameter shall not exceed 50 mm (2 in.). Clearances of 100 mm (4 in.) to the side and 50 mm (2 in.) to the rear shall be provided to allow for hand movement. Joysticks shall be mounted to provide forearm support. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.

26.2.4.2 Finger-Operated Displacement Joysticks:

(a) Specific Use—In addition to the general uses, finger-operated displacement joysticks are useful for free-drawn graphics. In this application, there is usually no spring return to center, and the resistance shall be sufficient to maintain the handle position when the hand is removed.

(b) Dynamic Characteristics—Movement shall not exceed 785 mrad (45°) from the center position. Movement shall be smooth in all directions, and positioning of a follower shall be attainable without noticeable backlash, cross-coupling, or need for multiple corrective movements. Control ratios, friction, and inertia shall meet the dual requirements of rapid gross positioning and precise fine positioning. Recessed mounting or pencil attachments may be used to provide more precise control. When used for generation of free-drawn graphics, the
refresher rate for the follower on the CRT shall be sufficiently high to give the appearance of a continuous track. Delay between control movement and the confirming display response shall be minimized and shall not exceed 0.1 s.

(c) Dimensions, Resistance, and Clearance—The joystick shall be mounted on a desk or shelf surface as shown in Fig. 49. Joysticks shall be mounted to provide forearm or wrist support. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.

26.2.4.3 Thumbtip/Fingertip-Operated:

(a) Specific Use—Thumbtip/fingertip-operated joysticks may be mounted on a handgrip, which serves as a steady rest to damp vibrations or increase precision. If so mounted, the handgrip shall not simultaneously function as a joystick controller.

(b) Dynamic Characteristics:

(c) Dimensions, Resistance, and Clearance—Joysticks shall be mounted to provide wrist or hand support. Console mounted devices shall be mounted as shown in Fig. 49. Modular devices shall be mounted to allow actuation of the joystick without slippage, movement, or tilting of the mounting base.
26.3 Ball Control (Also Known as Track Ball, Ball Tracker, Joyball, and Rolling Ball):

26.3.1 Use—A ball control suspended on low-friction bearings may be used for various control functions such as data pickoff on a display. The ball control cannot provide an automatic return to point of origin, hence if used in applications requiring automatic return to origin following an entry or readout, the interfacing system must provide this. Because the ball can be rotated within limit in any direction, it is well suited for applications in which there may be accumulative travel in a given direction. In any application that would allow the ball to drive the follower on the display off the edge of the display, indicators shall be provided to advise the operator how to bring the follower back onto the display. Ball controls shall be used only as position controls (that is, a given movement of a ball makes a proportional movement of the follower on the display).

26.3.2 Dynamic Characteristics—The ball control shall be capable of rotation in any direction so as to generate any combination of x and y output values. When moved in either the x or y directions alone, there shall be no apparent cross coupling (follower movement in the orthogonal direction). While manipulating the control, neither backlash nor cross coupling shall be apparent to the operator. Control ratios and dynamic features shall meet the dual requirement of rapid gross positioning and smooth, precise fine positioning.

26.3.3 Limb Support—When trackball controls are used to make precise or continuous adjustments, wrist support or arm support or both shall be provided.

26.3.4 Dimensions, Resistance, and Clearance—Dimensions, resistance, and clearances shall conform to the criteria in Fig. 50. The smaller diameter ball controls shall be used only where space availability is very limited and when there is no need for precision. Preferred mounting is on a shelf or desk top.

26.4 Grid-and-Stylus Devices—These provisions cover various techniques that use some means of establishing an x and y grid and a stylus for designating specific points on that grid for control purposes (time-shared x and y potential grids and a voltage-sensitive stylus).

26.4.1 Application—Grid and stylus devices may be used for data pickoff from a CRT, entry of points on a display,
generation of free-drawn graphics, and smaller control applications. The grid may be on a transparent medium allowing stylus placement directly over corresponding points on the display or it may be displaced from the display in a convenient position for stylus manipulation. In either case, a follower (bug, mark, hook, and so forth) shall be presented on the display at the coordinate values selected by the stylus. Devices of this type shall be used only for zero order control functions (that is, displacement of the stylus from the reference position causes a proportional displacement of the follower).

26.4.2 Dynamic Characteristics—Movement of the stylus in any direction on the grid surface shall result in smooth movement of the follower in the same direction. Discrete placement of the stylus at any point on the grid shall cause the follower to appear at the corresponding coordinates and to remain steady in position so long as the stylus is not moved. Refresh rate for the follower shall be sufficiently high to ensure the appearance of a continuous track whenever the stylus is used for generation of free-drawn graphics.

26.4.3 Dimensions and Mounting—Transparent grids that are used as display overlays shall conform to the size of the display. Grids that are displaced from the display shall approximate the display size and shall be mounted below the display in an orientation to preserve directional relationships to the display.
maximum extent (a vertical plane passing through the north/south axis on the grid shall pass through or be parallel to the north/south axis on the display).

26.5 Free-Moving X-Y Controller (Mouse):

26.5.1 Application—This type of controller may be used on any flat surface to generate $x$ and $y$ coordinate values that control the position of the follower on the associated display. It may be used for data pickoff or for entry of coordinate values. It shall be used for zero order control only (generation of $x$ and $y$ outputs by the controller results in proportional displacement of the follower). It shall not be used for generation of free-drawn graphics.

26.5.2 Dynamic Characteristics—The design of the controller and placement of the maneuvering surface shall be such as to allow the operator to consistently orient the controller to within $\pm 175$ mrad ($10^\circ$) of the correct orientation without

visual reference to the controller. (That is, for example, when the operator grasps the controller in what seems to be the correct orientation and moves it rectilinearly along what is assumed to be straight up the y axis, then the direction of movement of the follower on the CRT shall be between 175 and 6110 mrad (10° and 350°).) The controller shall be easily moveable in any direction without a change of hand grasp and shall result in smooth movement of the follower in the same direction ±175 mrad (10°). The controller shall be cordless and shall be operable with either the left or right hand. A complete excursion of the controller from side to side of the maneuvering area shall move the follower from side to side on the display regardless of scale setting or offset unless expanded movement is selected for an automatic sequencing mode of operation. In any application that would allow the controller to drive the follower off the edge of the display, indicators shall be provided to assist the operator in bringing the follower back onto the display.

26.5.3 Dimensions and Shape—The free-moving x-y controller shall have no sharp edges but shall be shaped roughly as a rectangular solid, with limiting dimensions as given in Table 18.

26.6 Light Pen:

26.6.1 Use—A simple light pen may be used as a track-oriented readout device. That is, it may be positioned on the display screen to detect the presence of a computer-generated track by sensing its refresh pattern; the display system will then present a follower (hook) on the designed track. With suitable additional circuitry, a follower can be made to track the movement of the light pen across the surface, thus allowing it to function as a two-axis controller capable of serving the same purposes as the grid and stylus devices (see 26.4, Grid and Stylus Devices).

26.6.2 Dynamic Characteristics—When used as a two-axis controller, light pen dynamic characteristics shall conform to 26.5.2.

26.6.3 Dimensions and Mounting—The light pen shall be 120 to 180 mm (4.7 to 7.1 in.) long with a diameter of 7 to 20 mm (0.3 to 0.8 in.). A convenient clip shall be provided at the lower right side of the CRT to hold the light pen when it is not in use.

26.7 High-Force Controls:

26.7.1 Use—In general, controls requiring operator forces exceeding the strength limits of the lowest segment of the expected user population shall not be used. In addition, high-force controls shall not be used except when the operator’s nominal working position provides proper body support or limb support or both, such as, seat backrests, foot supports. Sustained (durations longer than 3 s) high-force requirements shall be avoided.

26.7.2 Arm-, Hand-, and Thumb-Finger Controls—Where arm-, hand-, and thumb-finger controls requiring high-control forces are to be used, the maximum force requirements shall not exceed those specified in Table 19 and Table 20, which shall be corrected, where applicable, for females. (Two thirds of each value shown is considered to be a reasonable adjustment.)

26.7.3 Foot Controls—Where foot controls requiring high-control forces are to be used, the force push exerted by the leg depends on the thigh angle and knee angle. Fig. 21 specifies the mean maximum push at various knee and thigh angles. The maximum push is about the 160° angle, referred to as the limiting angle. The values of Fig. 21 apply to males only and shall be corrected for females. (Two thirds of each value is considered to be a reasonable adjustment.)

26.8 Touch-Screen Controls for Displays:

26.8.1 Use—Touch-screen control may be used to provide an overlaying control function to a data display device such as CRTs, dot matrix/segmented plays, electroluminescent displays, programmable indicators, or other display devices in which direct visual reference access and optimum direct control access are desired.

26.8.2 Luminance Transmission—When used, touch-screen displays shall have sufficient luminance transmission to allow the display with touch screen installed to be clearly readable in the intended environment and meet the display luminance requirements herein.

26.8.3 Positive Indication—A positive indication of touch-screen activation shall be provided to acknowledge the system response to the control action.

26.8.4 Dimensions and Separation—The dimensions and separation of responsible areas of the touch screen shall conform to S1, S2, and Bw of Fig. 43.

26.8.5 Pressure—The actuation pressure of the touch screen shall conform to the alphanumeric resistance limits of Table 15.

26.8.6 Resistance—Force required to operate force-actuated touch screens shall conform to the alphanumeric resistance limits of Table 15.

26.9 Miniature Controls:

26.9.1 Use—Miniature controls may be used only when severe space limitations exist. Miniature controls shall not be used when available space is adequate for standard-sized controls or when heavy gloves or mittens will be worn.

26.9.2 Dimensions, Resistance, Displacement, and Separation—When design constraints dictate the use of miniature controls, the dimensions and separation of the controls shall be the maximum permitted by the available space up to the maxima prescribed herein for standard-sized controls. Resistance and displacement of miniature controls shall conform to the criteria specified for the standard size of that type of control.

| TABLE 18 Limiting Dimensions for Free-Moving X-Y Controller |
|-----------------------------|-----------------------------|
| Dimension                   | Minimum | Maximum |
|                             | mm | (in.) | mm | (in.) |
| Width (spanned by thumb to  | 40 (1.6) | 70 (2.8) |
| finger grasp)               |       |       |
| Length                      | 70 (2.8) | 120 (4.7) |
| Thickness                   | 25 (1.0) | 40 (1.6) |
26.9.3 Other Requirements—Other design considerations (labeling, orientation, and so forth) shall conform to the requirements specified for the standard size of the control.

27. General Requirements for Labeling

27.1 Application—Labels shall be provided whenever it is necessary for personnel to identify equipment, follow procedures, or avoid hazards, except where it is obvious to the observer what an item is and how it may be used.

27.2 Characteristics—Label characteristics shall be consistent with such factors as:

27.2.1 Accuracy of identification required.
27.2.2 Time available for recognition or other responses.
27.2.3 Distance at which the labels must be read.
27.2.4 Illuminant level and color.
27.2.5 Criticality of the function labeled.
27.2.6 Consistency of label design within and between systems.

27.3 Types:
27.3.1 Label—The term label, when used alone, shall mean any type of plate, sign, placard, inscription, legend, marking, or combination of these, that is used for purposes of identification, or to impart information or instructions to the reader. This term is used generically herein to describe all the specific types of labels described below.

27.3.2 Identification Label—An identification label is a specific type of label used for identification purposes only. Identification labels are used to identify such things as spaces, locations, equipment, systems, controls and displays, classifications (for example, damage control and control), and so forth.

27.3.3 Hazard Label—The term hazard plate is used to describe a specific category of labels that are used to identify and provide information about existing or potential situations that may be hazardous to ship personnel or equipment. There are only two required types of hazard labels: the danger label, and the caution label. For U.S. Navy ships, a third type is required, warning labels. The difference between a danger label, warning label, and a caution label is the degree of seriousness of the potential hazard, as defined below.

27.3.3.1 Danger Label—A danger label is a type of hazard label and is used to identify and provide information about a situation in which an action or omission of one on the part of the crew member could result in serious injury or death, serious damage to vital equipment, or a major reduction in the ship’s capability to perform its mission.

27.3.3.2 Warning Label—A warning label is used to indicate a location, equipment, or system in which a potential hazard exists, capable of producing injury or death to personnel, if approved procedures are not followed.

27.3.3.3 Caution Label—A caution label is a type of hazard label and is used to identify and provide information about a situation in which an action or omission of one on the part of the crew member could result in a minor injury, minor damage to equipment, or a minor reduction in the ship’s capability to perform its mission.

27.3.4 Instruction Label—An instruction label is a specific type of label used to present step-by-step instructions for accomplishing a specific task (operation or maintenance related) and to provide hazard and safety information related to performing the task.

27.3.5 Information Label—An information label is a specific type of label used to present nonprocedural, information of a general nature, related to health, first aid, sanitation, rules, housekeeping, general conduct, and so forth.

28. Label Content

28.1 Abbreviations:
28.1.1 Criteria for Use—Abbreviating a word or word group shall be used only if one of two conditions exists:
28.1.1.1 There is insufficient space available at the location where the label is to be affixed for the design of a label that would allow the entire inscription to be spelled out.
28.1.1.2 The abbreviation is more commonly known and understood by the user population than the spelled out word or word group.

28.1.2 Criteria for Development—If the need for an abbreviation has been justified, and a standard abbreviation does not exist in MIL-STD-12, nor does a standard abbreviation exist that is commonly understood and recognized by the intended user population, then, the following rules shall be applied to develop the abbreviation.

28.1.3 Case—Capital letters shall be used for abbreviations.
28.1.4 Single Words—When abbreviating single words:
28.1.4.1 Determine the number of characters required in the abbreviated term.
28.1.4.2 The same abbreviation shall be used for all tenses and for both singular and plural forms of a word. Remove

</table>
suffixes such as -ed, -es, -er, and -ing from the word to be abbreviated. (Make sure they are suffixes, as in “waxing,” and not an integral part of the word, as in “spring.”)

28.1.4.3 Choose the first letter and last consonant of the word to be abbreviated as the first and last letter of the abbreviation. For example, Multiplexor would be M–R.

28.1.4.4 Fill the remaining spaces with the consonants in the order in which they appear in the word. Avoid the use of a double consonants in the abbreviation. For example, a five-character abbreviation for Multiplexor would be MLTPR, a four-character abbreviation would be MLTR, and three-character abbreviation would be MLR.

28.1.4.5 If there are insufficient consonants, use the first vowel in the order in which it appears in the word. For example, an eight-character abbreviation for Multiplexor would be MULTPLXR.

28.1.5 Two-Word Groups—When abbreviating two-word groups:

28.1.5.1 Determine the number of characters required in the abbreviated term.

28.1.5.2 Take half of the characters from the first word and the other half from the second word, using the above abbreviation methodology for single words. If an odd number of total characters is needed, take the odd character from the longer word. For example, a five-character abbreviation for Area Multiplexor would be AR MLR.

28.1.6 Three or More Word Groups—When abbreviating groups of three or more words, form an acronym by using the first letter of each word. For example, Aqueous Film Forming Foam would be abbreviated AFFF.

28.1.7 Standardization—Abbreviations shall be standardized and used consistently on the labels. All abbreviations which are not found in MIL-STD-12 shall be approved by the procuring activity before being used.

28.1.8 Punctuation—Periods or other punctuation shall not be used after abbreviations.

28.2 Brevity—Labels shall be as concise as possible without distorting the intended meaning or information and shall not be ambiguous. The amount of information provided shall be only that required to convey a clear message to the intended user; however, brevity shall not be stressed if the results will be unfamiliar to the user. Excessive detail, redundant words, phrases, and information shall be avoided.

28.3 Familiarity—Words and abbreviations shall be chosen on the basis of familiarity by the intended user population. For particular users (for example, maintenance technicians), common technical terms may be used even though they may be unfamiliar to crew members who are not expected to be part of the user population.

28.4 Irrelevant Information—Trade names, company logos, or other information not directly required by the user shall not appear on any labels, or be the subject of a label.

28.5 Symbols:

28.5.1 Dependent Symbols—Symbols that alone do not impart any specific information to the user (for example, %, +, −), but require the existence of supporting data to provide meaningful information (for example, 10 %, +5 psi, 3 lbs).

28.5.2 Independent Symbols—Symbols that alone provide information to the user and normally are associated with hazard or emergency situations. Examples of independent symbols suitable for shipboard use are shown in Fig. 51.

28.5.3 Use—Dependent symbols shall be used only when they have an accepted meaning to all intended users. Independent symbols may be integrated with any label that addresses the subject of the symbol (for example, a hazard label that identifies a potential shock hazard may contain the lightning bolt symbol). An independent symbol shall not be used alone to identify a hazardous situation; it shall always be accompanied by appropriate text as specified herein. An independent symbol may be used alone for nonhazardous identification purposes (for example, the first aid cross symbol may be used alone to identify a first aid kit).

28.6 Format:

28.6.1 Consistent—All labels of the same type shall be consistent in format and presentation of information.

28.6.2 Heading—Headings and subheadings shall be used to identify groups of related information. Headings and subheadings shall be of larger character size than the text of the label, with the major heading or label title the largest and subheadings of subsequently smaller size.

28.6.3 Integrated Safety and Hazard—Safety and hazard information that is integrated with other information (such as instructions) on labels other than hazard label shall be designed such that the safety and hazard information is clearly and distinctly different, visually, from the other information and is easily identified by the user.

28.7 References—References directing the user to other documents or sources of information shall not be made in a label if the referenced material is required to complete a task, recognize or avoid a hazardous situation, or clearly or completely understand the message of the label. References to other documents or sources of information may be used only to direct the user to supplemental information.

28.8 Character/Background Color:

28.8.1 Background and Character Color—Label background color shall contrast with the color of the surface to which it will be affixed. Any special background color shall be approved by the procuring activity before its use.

28.8.2 Other Labels—Where the ambient illuminance will be above 0.9 ft-c (10 lux), identification labels, instruction labels, information labels, and graphic labels (all labels other than hazard labels) shall be provided with black characters on a light background. Where dark adaptation lighting (low level
white or red) is required, the displayed letters or numerals shall be visible without interfering with night vision requirements. Where possible, markings shall be white on a dark background.

28.9 Reflection—The use of glossy or highly reflective metallic materials for either the lettering or background shall be avoided.

28.10 Characters and Numerals:

28.10.1 Style—Characters shall be a simple block-type font, such as alternate gothic #2, news or trade gothic, or futura or spartan medium. All numerals shall be arabic.

28.10.2 Capital and Lowercase—All capital letters shall be used for identification labels, headings and subheadings, signal words such as danger, caution, attention, notice, legends, and short message labels. Capital and lowercase letters shall be used for extended sentence messages in which it is necessary to use punctuation.

28.10.3 Letter Width—The width of letters shall be ⅔ of the height, except for “M” and “W,” which shall be ⅔ of the height, and “I” which shall be one stroke wide.

28.10.4 Numerical Width—The width of numerals shall preferably be ⅔ of the height, except for the “4,” which shall be one stroke width wider, and the “1” which shall be one stroke wide.

28.10.5 Wide Characters—Where conditions indicate the use of wider characters, as on a curved surface, the basic height-to-width ratio may be increased to 1:1.

28.10.6 Stroke Width Normal—For black characters on a white (or light) background, the stroke width shall be ⅓ to ⅔ of the height.

28.10.7 Stroke, Width, Dark Adaptation—Where the dark adaptation is required or legibility at night is a critical factor, and white characters are specified on a black background, the stroke width of the characters shall be from ¼ to ⅓ of the height (narrower than specified for normal daytime vision). The stroke width shall be the same for all letters and numerals of equal height.

28.10.8 Stroke Width, Transilluminate Characters—For transilluminate characters, the stroke width shall be ¼ of the height.

28.10.9 Character Spacing—The minimum space between characters shall be one stroke width.

28.10.10 Word Spacing—Separation between words shall be the width of three characters (±½ width). The minimum space between words shall be the width of one character.

28.10.11 Line Spacing—The minimum space between lines shall be ¼-character height, but in no case shall the separation between the tallest character on a lower line be less than one stroke width from a character above that projects below the line.

28.10.12 Character Height and Viewing Distance—For general and panel design, with the luminance normally above 3.5 cd/m² (1 ft-L), for labels of all types, minimum character height shall conform to the following values for various expected viewing distances:

<table>
<thead>
<tr>
<th>Viewing distance mm (in.)</th>
<th>Minimum height mm (in.)</th>
<th>Minimum height pt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 500 (19.7)</td>
<td>2.3 (0.09)</td>
<td>[6]</td>
</tr>
<tr>
<td>500–1000 (19.7–39.4)</td>
<td>4.7 (0.18)</td>
<td>[12]</td>
</tr>
<tr>
<td>1000–2000 (39.4–78.7)</td>
<td>9.4 (0.37)</td>
<td>[26]</td>
</tr>
</tbody>
</table>

28.10.13 Letter and Numbers to Avoid—Avoid using the number “1” in combination with letter “L” or “I” and the number zero together with the letters “O” or “Q.”

28.11 Graphics:

28.11.1 Lines—The minimum stroke width for lines shall be equal to the minimum stroke width for characters.

28.11.2 Location—Label location throughout the ship shall be as consistent and uniform from space to space, system to system, as possible.

28.11.3 Label Groups—Placement of several (more than three) labels in a group shall be avoided. However, if more than one label is required to be mounted in the same location, the labels shall be grouped by label type and organized as follows:

28.11.3.1 Hazard labels shall be grouped together and be mounted in the most prominent location.

28.11.3.2 Instruction labels shall be mounted in the next most prominent location.

28.11.3.3 Information labels and graphic plates shall be mounted in the next most prominent location.

28.11.3.4 Graphic labels that are referenced by other types of labels shall be mounted adjacent to the referencing label.

28.11.3.5 Identification labels shall be mounted to ensure maximum visibility and shall be placed on or immediately adjacent to the items they identify. Mounting labels on bulkheads or other ship structures for identification of valves, machinery, or other equipment shall be avoided.

28.11.4 Preinstalled Labels—Items that have labels installed before the item is located in the ship shall be placed so the labels are visible and legible after the item is in place.

28.11.5 Visibility and Legibility—Labels shall be designed for easy and accurate reading based on the anticipated reader’s viewpoint and reading distance, ship vibration, ship motion, and ambient illumination levels. Labels shall not be covered or obscured by other equipment.

28.11.6 Label Surface—Labels shall be placed on flat surfaces. If a label must be located on a curved surface, it must be completely visible to the observer. If the curvature is such that the characters become too small to read, another mode of labeling shall be used (for example, on attached tag).

28.11.7 Label Life—Labels shall be constructed and mounted so as to remain legible for the lifetime of the label.

29. Specific Requirements by Label Type

29.1 Identification Label—There are no specific requirements for the use and format of identification label. Identification labels shall comply with all requirements for labels in general, as specified herein.

29.2 Hazard Labels:

29.2.1 Criteria for Use—Depending on the severity of the potential hazard, an appropriate danger or caution label shall be provided wherever it is necessary to minimize the possibility of injury to personnel, damage to equipment or systems or where special precautions must be exercised. Examples of the need for danger or caution labels include the following:

29.2.1.1 Fixed physical obstructions,

29.2.1.2 Moving or rotating equipment,
29.2.1.3 Equipment contact hazards (high voltage, high or low temperature, and so forth),
29.2.1.4 Radiation hazards (electromagnetic or nuclear),
29.2.1.5 Laser beam,
29.2.1.6 Toxic fumes exposure or toxic chemical contact,
29.2.1.7 Flash or high intensity light (welders, strobe lights), and

29.2.1.8 Requirements for safety equipment or clothing.
29.2.2 Danger/Warning/Caution Selection Criteria—
Selection of a danger, warning, or caution label shall be based on the descriptions given in Section 27.

29.2.3 Format:
29.2.3.1 General—Hazard labels shall be designed with an upper and lower component. The upper component shall contain the appropriate signal word, (DANGER, WARNING or CAUTION) and the lower component shall contain the necessary hazard inscription, as specified herein.

29.2.3.2 Signal Word—Danger labels shall contain only the signal word DANGER in the upper part of the label. Warning or caution labels shall contain only the signal word WARNING or CAUTION in the upper part of the label.

29.2.4 Inscription—All hazard labels shall contain, in the lower component, the following pieces of information presented in the order in which they are described below;
29.2.4.1 A brief statement of the hazard. If more than a single hazard is being identified, they shall be provided in a list rather than in paragraph format.
29.2.4.2 A brief statement instructing the reader how to avoid the stated hazard(s). If more than a single instruction is required, they shall be provided in step-by-step format rather than in paragraph format.

29.2.4.3 A brief statement of the potential consequences if the instructions for avoiding the hazard are not followed. If more than a single consequence is likely, they shall be provided in a list rather than paragraph format.

29.2.5 Lettering—The signal word shall be at least 50 % larger than the inscription text.

29.3 Character/Background Color:
29.3.1 General—Hazard labels shall be designed with an upper and lower component. The upper component shall contain the appropriate signal word (DANGER, WARNING, or CAUTION), and the lower component shall contain the necessary hazard inscription. See ANSI Z535.2 for label formats.

29.3.1.1 The signal word DANGER shall be in white letters on a red oval background with a white border on a black rectangular field. The inscription text shall be black characters on a white background.

29.3.1.2 The signal word DANGER and the text inscription shall be in white characters on a red background.

29.3.2 Warning or Caution Labels—Warning or caution labels shall comply with one of the two following character/background color schemes:

29.3.2.1 The signal word WARNING or CAUTION shall be yellow characters on a black rectangular background. The inscription text shall be black characters on a yellow background.

29.3.2.2 The signal word WARNING shall be black characters within a yellow truncated diamond on a black rectangular background. The inscription shall be black letters on a yellow background.

29.3.3 Caution Labels—The signal word CAUTION shall be yellow characters on a black rectangular background. The inscription shall be black letters on a yellow background.

29.4 Instruction Labels—An instruction label shall only be provided when:
29.4.1 It is likely that an item of equipment or system will be operated or maintained by personnel not trained for the task and the item of equipment or system is critical to the survivability or mission of the ship.

29.4.2 An item of equipment is authorized for use by all ship personnel and little or no training in its operation is provided.

29.4.3 The operation or maintenance of an item of equipment or system is lengthy and complex and it is likely that the task will have to be performed without the benefit of standard operating or maintenance procedure manuals or documents.

29.4.4 Format:
29.4.4.1 Title—All instruction labels shall be titled at the top of the label. The title shall identify the instructions as operating or maintenance, or both, and shall identify the equipment or system being addressed.

29.4.4.2 Hazard and Safety—Hazard and safety information that pertains to the task in general shall be provided on the label preceding the instructions. This information shall be labeled with a heading that identifies it as general hazard and safety information. Each statement identifying a potential hazard shall begin with the appropriate signal word DANGER, WARNING, or CAUTION.

29.4.4.3 Inscription—Instructions for completing the task shall be provided in numbered step-by-step format. Each step shall be stated as briefly and generically as possible. The instructions shall avoid the use of specific equipment model names or numbers or other aspects of the equipment or system that may change at some future time. Hazard and safety information that pertains to a particular step or steps in the procedure shall be provided immediately preceding the step or steps in the instructions. Each statement identifying a potential hazard shall begin with the appropriate signal word DANGER, WARNING, or CAUTION. Instructions shall be provided on a separate label from diagrams, schematics, charts, or other types of graphic labels, which may be referenced in the instructions. If operating instructions and maintenance instructions are provided on the same label, the operating instructions shall appear first, and the two groups of information shall be labeled with appropriate headings.

29.4.4.4 Lettering—The label title shall be at least 50 % larger than headings. Headings shall be at least 25 % larger than the inscription text.

29.5 Information Labels:
29.5.1 Criteria for Use—An information label shall only be provided when the information presented the reader will significantly contribute to the general safety, health, or readiness of the ship. Information labels shall not be used in place...
of hazard labels to identify potential hazards or in place of instruction labels to identify procedures for performing a task.

29.5.2 Format:
29.5.2.1 General—Information labels shall be designed with an upper and lower component. The upper component shall contain an appropriate signal word, and the lower portion shall contain the necessary information inscription, as specified below.

29.5.2.2 Signal Word—Information labels shall contain the signal word ATTENTION in the upper panel.

29.5.2.3 Inscription—The inscription may be presented in paragraph format; however, if the information or a portion of it is a list, that information shall be presented in a list format. Excessive amounts of detail shall be avoided. Headings shall be used, as appropriate, to organize and identify related information.

29.5.2.4 Lettering—The signal word shall be at least 50% larger than headings. Headings shall be at least 25% larger than the inscription text.

29.6 Graphic Labels:
29.6.1 Criteria for Use—A graphic label, which may take the form of a diagram, schematic, chart, and so forth, should be used only when such information is absolutely necessary or required.

29.6.2 Format:
29.6.2.1 Title—All graphic labels shall be titled at the top of the label. The title shall identify the equipment, system, or information being presented. If more than one schematic or diagram is presented on a single label, each shall be labeled with a heading.

29.6.2.2 Schematics and Diagrams—All graphic symbols and special nomenclature used on a graphic label shall be defined in a legend. Descriptive text shall be as brief as possible and shall not obscure or congest the diagram or schematic. Information shall be provided on the label that indicates location and orientation of the equipment or system in the ship, as appropriate.

29.6.2.3 Charts—All charts of the same type, or used for the same purpose, such as lubrication charts, shall be of the same format, including the use of the same headings, units of measure, and organization and presentation of information.

29.6.2.4 Lettering—The label title shall be at least 50% larger than headings. Headings shall be at least 25% larger than the smallest text.

29.7 Control and Displays Labels:
29.7.1 General—Controls and displays shall be appropriately and clearly labeled with the basic information needed for proper identification, utilization, actuation, or manipulation of the element.

29.7.2 Simplicity—Control and display labels shall convey verbal meaning in the most direct manner, by using simple words and phrases.

29.7.3 Functional Labeling—Each control and display shall be labeled according to function, and the following criteria shall apply:

29.7.3.1 Similar names for different controls and displays shall be avoided.

29.7.3.2 Instruments shall be labeled in terms of what is being measured or controlled, taking into account the user and purpose.

29.7.3.3 Control labeling shall indicate the functional result or control movement (for example, increase, ON, OFF) and may include calibration data where applicable. Such information shall be visible during normal operation of the control.

29.7.3.4 When controls and displays must be used together (in certain adjustment tasks), appropriate labels shall indicate their functional relationship. The selection and use of terminology shall be consistent.

29.7.3.5 The units of measurement (volts, psi, inches, and so forth) shall be labeled on the panel.

29.7.4 Location—Label location throughout a system and within panel groupings shall be uniform. The following criteria shall apply to the location of control and display labels:

29.7.4.1 Ease of control operation shall be given priority over visibility of control position labels.

29.7.4.2 Labels shall normally be placed above the controls and displays they describe. When the panel is above eye level, labels may be located below if label visibility will be enhanced. Controls shall not obscure labels.

29.7.4.3 Labels shall be used to identify functionally grouped controls and displays. The labels shall be located above the functional groups they identify. When a line is used to enclose a function group and define its boundaries, the label shall be centered at the top of the group either in a break in the line or just below the line. When colored pads are used, the label shall be centered at the top within the pad area.

29.7.5 Character Size Versus Luminance—The height of letters and numerals shall be determined by the required reading distance and luminance. With a 28 in viewing distance, the height of numerals and letters shall be within the range of values, specified in points, provided in Table 21 for “low” and “high” control-display luminance conditions.

29.7.6 Size Graduation—Labels shall be graduated in size beginning with the smallest (control position labels) being determined by viewing conditions. Each increase in size shall be approximately 25% larger. Guidelines for control-display label size gradations are shown in Fig. 52.

29.8 Units, Assemblies, Subassemblies, and Parts:

---

**TABLE 21** Character Size Versus Luminance

<table>
<thead>
<tr>
<th>Markings</th>
<th>Character Heighta</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Low Light (Below 1 ft-L), mm (in.) [pt]</td>
</tr>
<tr>
<td>For critical markings, with positions variable (numerals on counters, settable or moving scales, and so forth)</td>
<td>5.5–8.6 (0.21–0.33)</td>
</tr>
<tr>
<td>For critical markings, with position fixed (numerals on fixed scales, controls, switch markings, emergency instructions, and so forth)</td>
<td>4.7–8.6 (0.18–0.33)</td>
</tr>
<tr>
<td>For noncritical markings (identification labels, routine instructions, markings required only for familiarization)</td>
<td>1.6–5.5 (0.07–0.21)</td>
</tr>
</tbody>
</table>

aValues assume a 711-mm (28-in.) viewing distance. For Distance D, other than 28 in., multiply the character height by D/28 and round to the next higher point.
29.8.1 General—Each unit, assembly, subassembly, and part shall be labeled with a clearly visible, legible, and meaningful name, number, code, mark, or symbol as applicable.

29.8.2 Simplicity—Equipment shall be labeled with terms descriptive of the test or measurement applicable to their test points (for example, demodulator rather than crystal detector and power amplifier rather than bootstrap amplifier).
29.8.3 Location—The gross identifying label on a unit, assembly, or major subassembly shall be located:
29.8.3.1Externally in such a position it is not obscured by adjacent items.
29.8.3.2 On the flattest, most uncluttered surface available.
29.8.3.3 On a main chassis of the equipment.
29.8.3.4 In a way to minimize wear or obscurement by grease, grime, or dirt.
29.8.3.5 In a way to preclude accidental removal, obstruction, or handling damage.
29.9 Prototype and Production Equipment Labels—Labels for both prototype and production equipment shall meet the criteria specified herein. Labels for production equipment shall meet the criteria specified for the duration of equipment use. Since frequent design changes may be anticipated in prototype equipment, labels for such equipment shall be simply and easily affixed, altered, and removed.

29.10 Installation:
29.10.1 Orientation—Labels shall be horizontal and read from left to right. Where space is limited and the label is not critical for personnel or equipment safety, a vertical label may be used that shall read from top to bottom. Labels shall not be placed on controls that turn (except value handwheels) which could place the label in an upside down position.

30. Anthropometry

30.1 General—The design of any system, individual piece of equipment, or total vessel is most efficient and cost effective if it is laid out from the beginning, around the human. One important aspect of designing to accommodate the human is to ensure that the design is compatible with the physical dimensions of the human body. Consequently, design limits shall be based on a range from the fifth to the ninety-fifth percentile for critical body dimensions. If females are expected users, then the fifth percentile dimensions used shall be those for women. If males only will be the users, then the lower design limit shall be fifth percentile dimensions for men. The upper design limit is always for the ninety-fifth percentile male. For any body dimension, the fifth percentile value indicates that 5% of the population will be equal to or smaller than that value, and 95% will be larger; conversely, the ninety-fifth percentile values indicate that 95% of the population will be equal to or smaller than that value and 5% will be larger. Therefore, use of a design range from the fifth to the ninety-fifth percentile values will theoretically provide coverage for 90% of the user population for that dimension. The limited anthropometric data presented in this section is intended to provide general design guidance. Use of these data shall take the following into consideration:

30.1.1 The nature, frequency, safety, and difficulty of the related tasks to be performed by the operator or wearer of the equipment.
30.1.2 The position of the body during performance of these tasks.
30.1.3 Mobility or flexibility requirements imposed by these tasks.
30.1.4 Increments in the design-critical dimensions imposed by the need to compensate for obstacles, projections, and so forth.

30.1.5 Increments in the design-critical dimensions imposed by protective clothing or equipment, packages, lines, padding, and so forth.

30.2 Anthropometric Data—The anthropometric data presented in Figs. 53-58 and Table 22 represent various body measurements, that is, anthropometric data. The open numbers are for the nude body, and are given for the fifth and ninety-fifth percentile male and female in both inches and centimetres. Fig. 59 presents anthropometric data for several dynamic body positions often involved in work activities. Figs. 60-62 provide dimensions for head and hand protectors frequently worn by personnel on a ship.

30.3 Use of Data:

30.3.1 Data Limitations—Because some of the anthropometric data presented here represent only nude body measurements, suitable allowances shall be made for light or heavy clothing, helmets, boots, body armor, load-carrying equipment, protective equipment, and other worn or carried items, when using these data for design criteria.

30.3.2 Clearance Dimensions—Clearance dimensions (for example, for passageways and access areas) that must accommodate or allow passage of the body or parts of the body shall be based upon the ninety-fifth percentile values for applicable body dimensions.

30.3.3 Limiting Dimensions—Limiting dimensions (reaching distance, control movement, displays, test points, handrails, and so forth) that restrict or are limited by extensions of the body shall be based upon the fifth percentile values for applicable body dimensions.

30.3.4 Adjustment Dimensions—Seats, restraint systems, safety harnesses, belts, controls, or any equipment that must be adjusted for the comfort or performance of the individual user shall be adjustable over the range of the fifth to ninety-fifth percentile values for the applicable body member(s).

30.3.5 Clothing and Personal Equipment—Clothing and personal equipment (including protective or specialized equipment worn or carried by the individual) shall be designed and sized to accommodate at least the fifth through the ninety-fifth percentile values of body dimensions. Pertinent dimensions of essential or critical equipment (for example, aviators’ helmets) shall be based on the first and ninety-ninth percentile values. Where two or more dimensions are used simultaneously as design parameters, appropriate multivariate data and techniques shall be used. (See appendix for representative references.)

30.4 Special Populations—Where equipment will be used, inclusively or exclusively, by selected or specialized segments of the user population or population ranges other than the fifth to ninety-fifth percentiles, appropriate available anthropometric data on these specialized populations shall be used for design and sizing criteria. Where equipment is intended for use by foreign personnel, appropriate anthropometric data on such populations shall be used for design and sizing criteria.

30.5 Range of Human Motion—The range of body movement for the arms, legs, and head are shown in Fig. 63 and Table 23. These values are based on the nude body and would have to be reduced for the clothed personnel.

</table>

^Numbers are for males only dressed in arctic clothing.
31.1.1 Kick Space—All cabinets, consoles, and work surfaces that require an operator to stand or sit close to their front surfaces shall contain a kick space at the base at least 100 mm (4 in.) deep and 100 mm (4 in.) high to allow for protective or specialized apparel.

31.1.2 Handles—Handles on cabinets and consoles shall be recessed whenever practicable to eliminate projections on the surface. If handles cannot be recessed, they shall be designed such that they shall neither injure personnel nor entangle clothing or equipment.

31.1.3 Work Space—Work space shall be provided to perform all operational and maintenance tasks by the fifth to ninety-fifth percentile person wearing the appropriate clothing and using the required tools. In establishing the work space, consideration shall be given to the number of personnel required to perform the work and the body positions required to do the work. Dimensions for typical work positions are shown in Fig. 64 and Table 24.

31.1.3.1 Depth of Work Area—Clearance from the front of the rack to the nearest facing surface or obstacle shall not be less than 1.07 m (42 in.). The minimum space between rows of cabinets shall be 200 mm (8 in.) greater than the depth of the deepest drawer (equipment).

31.1.3.2 Lateral Work Space—The minimum lateral workspace for racks having drawers or removable equipment shall be as follows (measured from the drawers or equipment in the extended position):

(a) For racks having drawers or removable items weighing less than 20 kg (44 lbs): 460 mm (18 in.) on one side and 100 mm (4 in.) on the other.

(b) For racks having drawers or removable items weighing over 20 kg (44 lbs): 460 mm (18 in.) on each side.
31.1.3.3 **Space Between Rows of Cabinets**—The minimum space between rows of cabinets shall be 200 mm (8 in.) greater than the depth of the deepest drawer or cabinet.

31.1.4 **Storage Space**—Adequate and suitable space shall be provided on consoles or immediate work space for the storage of manuals, worksheets, and other materials that are required for use by the operational or maintenance personnel.

31.2 **Standing Operations**:

31.2.1 **Work Surface**—Standing work surface and space dimensions are shown in Table 25, Fig. 65 and Fig. 66.

31.2.2 **Displays/Controls in a Standing Workplace**—Displays and controls located for use by a standing operator (for example, gage boards, bulkhead mounted, fiddle-boards, consoles, and so forth) shall be located as shown in Figs. 67-69 and as described herein.

31.2.3 **Display Placement, Normal**—Visual displays mounted on vertical panels and used in normal equipment operation shall be placed between 1.04 m (41 in.) and 1.78 m (70 in.) above the standing surface except that displays above that height are permitted, up to 2.13 m (84 in.), provided they are tilted down (see Fig. 69).

31.2.4 **Display Placement, Special**—Displays requiring precise and frequent reading shall be placed between 1.27 m (50 in.) and 1.65 m (65 in.) above the standing surface.

31.2.5 **Control Placement, Normal**—All controls (except valve handwheels) mounted on a vertical surface and used in normal equipment operation shall be located between 762 mm and 1.93 mm (30 and 76 in.) above the standing surface with a maximum height of 1.78 m (70 in.) preferred (see Fig. 69). Valve handwheels shall be located as shown in Fig. 38.
31.2.6 Control Placement, Special—Controls requiring precise or frequent operation and emergency controls shall be mounted between 860 mm and 1.35 m (34 and 53 in.) above the standing surface and no farther than 530 mm (21 in.) laterally from the centerline.

31.2.7 Window Placement—Work stations requiring vision outside through windows shall be designed so the lower edge of the window is no more than 1.3 m (52 in.) and the upper edge no less than 1.85 m (74 in.) above the deck, except for forward bridge windows which shall be no less than 1.98 m (79
Where reflection from window glass could be a problem, the window shall be angled from the vertical, top out and bottom-in, 15°, but in no case shall the angle be less than 8° or more than 25°.

31.3 Seated Operations:

31.3.1 Desk Dimensions—Dimensions for a seated desktop work station are provided in Fig. 70 and Table 26.

31.3.1.1 Work Surface Width and Depth—A lateral workspace of at least 760 mm (30 in.) wide and 400 mm (16 in.) deep shall be 740 to 790 mm (29 to 31 in.) above the floor, unless otherwise specified.

31.3.2 Writing Surfaces—Where a writing surface is required on equipment consoles, it shall be at least 400 mm (16 in.) deep and shall be 610 mm (24 in.) wide, when consistent with operator reach requirements.

31.3.3 Seating:

31.3.3.1 Compatibility—Work seating shall provide an adequate supporting framework for the body relative to the activities that must be carried out. Chairs to be used with sit-down consoles shall be designed operationally compatible with the console configuration.

31.3.3.2 Vertical Adjustment—Provision shall be made for vertical seat adjustment from 380 to 535 mm (15 to 21 in.) in increments of no more than 25 mm (1 in.) each.

31.3.3.3 Backrest—A supporting backrest that reclines between 1745 and 2005 mrad (100 and 115°) shall be provided.

</table>

FIG. 59 Anthropometric Data for Body Positions Involved in Work Activities
The backrest shall engage the lumbar and thoracic regions of the back and shall support the torso in such a position that the operator’s eyes can be to the normal line of sight (Fig. 8) with no more than 75 mm (3 in.) of forward body movement.

31.3.3.4 Cushioning—Where applicable, both the backrest and seat shall be cushioned with at least 25 mm (1 in.) of compressible material and provided with a smooth surface.

31.3.3.5 Work Surface Height—Desk tops and writing tables shall be 740 to 790 mm (29 to 31 in.) above the floor, unless otherwise specified.

31.3.3.6 Armrests—Modified or retractable armrests shall be provided when necessary to maintain compatibility. Alone with an associated console and shall be adjustable from 190 to 280 mm (7.5 to 11 in.) above the compressed sitting surface.

31.3.3.7 Knee Room—Knee and foot room that equals or exceeds the following minimum dimensions shall be provided beneath work surfaces:

(a) Height: 640 mm (25 in.). If a fixed footrest or a foot-operated control is provided, this dimension shall be increased accordingly.

(b) Width: 510 mm (20 in.).

(c) Depth: 460 mm (18 in.).

31.3.3.8 Seating at Tables—For single or multiple persons sitting at tables or other nondesk-type of work stations, the dimensions shown in Fig. 71 shall be provided. Table height, knee clearance, and so forth, shall be the same as in Fig. 70.

31.3.3.9 Seating at CRT-Type Work Stations—Seating dimensions for stool or chair seating at CRT-type displays or other similar work stations is shown in Fig. 72.

31.3.3.10 Swing-Away Seats—Where permanent seats cannot be provided, swing-away seats shown in Fig. 73 shall be provided.

31.3.4 Display Placement, Normal—Visual displays mounted on vertical panels and used in normal equipment operation shall be placed in an area between 150 and 1170 mm (6 and 46 in.) above the sitting surface.

31.3.5 Display Placement, Special—Indicators that must be read precisely and frequently shall be placed in an area between 360 and 890 mm (14 and 35 in.) above the sitting surface and no further than 530 mm (21 in.) laterally from the centerline.
31.3.6 Warning Displays—For “sit” consoles requiring horizontal vision over the top, critical visual warning displays shall be mounted at least 570 mm (22.5 in.) above the sitting surface.

31.3.7 Control Placement, Normal—All controls mounted on a vertical surface and used in normal equipment operation shall be located between 200 and 860 mm (8 and 34 in.) above the sitting surface.

31.3.8 Control Placement, Special—Controls requiring precise or frequent operation shall be mounted between 200 and 740 mm (8 and 29 in.) above the sitting surface.

31.3.9 Window Placement—Seated work stations requiring vision outside, through windows, shall be designed so the lower edge of the window shall be no higher than 1.0 m (40 in.) above the deck.

31.4 Standard Console Design:

31.4.1 Dimensions—For purposes of standardization, consoles and the units and racks that constitute operator work stations shall be designed to conform with the dimensions shown in Fig. 74 and Table 27.

31.4.2 Configurations—The configurations represented in Fig. 74 and Table 27 may not be applicable to all design situations, since, in some cases, operational requirements may necessitate unique design solutions. However, because of the benefits and economies inherent in a standard console, design shall conform with the standard configurations whenever possible.

31.4.3 Variables—The selected console design shall accommodate the following requirements, as applicable:

31.4.3.1 Visibility over the top of the console.

31.4.3.2 Operator mobility (sit, stand, or sit-stand requirements).
31.4.3.3 Panel space (note Columns “B” and “E,” Table 27).
31.4.3.4 Volume in the area below the writing surface.
31.4.4 Console Selection—On the basis of the considerations in 31.4.3, the particular configuration that will best meet the requirements shall be selected from among the console types represented in Figs. 75-77, or a special design created which meets requirements of 31.4.3 and the particular unique requirements imposed on the console, as long as the console configuration is operable and maintainable by the fifth to ninety-fifth percentile operator.

31.5 Special-Purpose Console Design:
31.5.1 One- or Two-Tier (Horizontal Wraparound):
See Fig. 75.
31.5.1.1 Panel Width—When requirements for preferred panel space for a single-seated operator exceed a panel width of 1.12 m (44 in.), a flat-surface, segmented, wraparound console shall be provided to place all controls within the reach of the fifth percentile stationary operator.
31.5.1.2 Panel Angle—The left and right segments shall be placed at an angle, measured from the frontal plane of the central segment, such that they can be reached by the fifth percentile stationary operator.
31.5.1.3 Dimensions With Vision Over Top—Where vision over the top is required, console height shall be in accordance with Table 27. The width of the central segment shall not exceed 1.12 m (44 in.), with 915 mm (36 in.) preferred, and that of the left and right segments shall not exceed 610 mm (24 in).
31.5.1.4 Dimensions Without Vision Over Top—Where vision over the top is not required, the total console height shall
be in accordance with Table 27. The width of the central
FIG. 63 Range of Human Motion (continued)
segment shall not exceed 915 mm (36 in.) and that of the left and right segments shall not exceed 610 mm (24 in.).

31.5.1.5 Viewing Angle—The total required left-to-right viewing angle shall not exceed 3.32 rad (190°). This angle shall be reduced whenever possible through appropriate control-display layout.

31.5.2 Three-Tier Flat and Wraparound (Also Called Vertical/Stacked Segments)—(See Fig. 76 for example).

31.5.2.1 Panel Division—Where direct forward vision over the top of the console is not required by a seated operator, and when lateral space is limited, the panel may be divided into three tier segments with surfaces perpendicular to the operator’s line of sight with little or no head movement.

31.5.2.2 Height—The height from the seat reference point to the centerline of the #2 tier shall be 737 mm (29 in.) preferred and 800 mm (31.5 in.) maximum. The height of the #2 tier shall be from 406 mm (16 in.) to 530 mm (21 in.) maximum. If feasible, no controls shall be placed on the third tier but displays only. If controls are placed on the third tier, they shall be reachable by a seated fifth percentile person.

31.6 Console Orientation in the Ship:

31.6.1 Propulsion, Steering, and Navigation—Operator consoles associated with control of the propulsion engines, boilers, and so forth, navigation (chart tables), and steering

</table>

Notes: These values are based on the nude body. The ranges are larger than they would be for clothed personnel.

Flexion: Bending or decreasing the angle between parts of the body.
Extension: Straightening or increasing the angle between parts of the body.
Adduction: Moving toward the midline of the body.
Abduction: Moving away from the midline of the body.
Medial rotation: Turning toward the midplane of the body.
Lateral rotation: Turning away from the midplane of the body.
Pronation: Rotation of the palm of the hand downward.
Supination: Rotation of the palm of the hand upward.
(especially the emergency steering system) shall be installed so the operator faces forward (in the direction of vessel movement). This shall be done whether or not the console operator has visual capability to the outside.
31.6.2 Auxiliary Machinery—Consoles controlling auxiliary machinery (ship service generators) shall be oriented so that the operator faces forward. If there is more than one auxiliary machinery room, with a control console in each, all consoles shall face in the same direction (operator facing forward preferred).

31.6.3 Damage Control, Ballast Control, and Other Consoles—Ballast or damage control consoles shall be installed so that the operator faces forward or inward from the starboard side. Other consoles may be installed in a manner best suited to placing the controls and displays on the console so that they are in direct relationship to their respective equipment’s location in the vessel.

31.7 Console Layout:

31.7.1 Spatial Relationships—Where a console contains controls and displays related to specific equipment located in a vessel, the location of the controls and displays on the console shall be in the same spatial relationship as the equipment they control or monitor. Therefore, controls and displays on the left side of the console shall be associated with equipment physically located to the left side of the console operator, and controls and displays on the right side of the console shall be associated with equipment physically located to the right side of the operator as the operator faces the console. Where a console is arranged so that the control and display arrangement correlates directly to equipment physically located in the vessel laid out from bow to stern, the controls and displays closest to the right side or top of the console shall control or monitor the equipment closest to the bow. The controls and displays at the left side or bottom of the console shall control or monitor the equipment closest to the stern.

31.7.2 Primary Displays—The primary visual surface on consoles or instrument panels shall be reserved for displays that are used frequently or are critical to successful operation. In general, this area shall correspond to the preferred viewing area shown in Fig. 78.

31.7.3 Design Principal Displays—Consoles shall follow the design principals listed below:

31.7.3.1 Indicators used for long, uninterrupted periods shall be in the primary display area.

31.7.3.2 Preferred viewing distance from the operator’s eyes to displays is 635 mm (25 in.).

31.7.3.3 Viewing distance to displays shall not be less than 250 to 300 mm (10 to 12 in.) for short viewing periods and preferably not less than 400 mm (16 in.).

31.7.3.4 Angular deviation from the operator’s line of sight up to 0.79 rad (45°) for display location is acceptable provided accurate instrument reading is not essential and parallax is not great.

31.7.3.5 Displays shall be shaped and oriented so that they correspond with the direction and magnitude of what they are representing.

31.7.3.6 Digital displays shall be used only when exact values are required and rate of change information is not required.

31.7.4 Design Principals, Controls—The optimum space for locating controls on a console (for optimum speed and accuracy of manipulation) is shown in Fig. 79. Other principals include the following:

31.7.4.1 Primary controls shall be located between shoulder level and waist height.

31.7.4.2 Controls shall be located so that simultaneous operation of two controls will not necessitate a crossing or interchanging of hands.

31.7.4.3 When controls are operated frequently, they shall be located to the left front or right of the operator.

31.7.4.4 Frequently used controls shall be grouped together, unless there are overriding reasons for separating them.

31.7.4.5 Frequently used controls shall be located for right-hand operation.

31.7.4.6 Frequently used controls shall be within a radius of 400 mm (16 in.) from the normal working position.

31.7.4.7 Occasionally used controls shall be within a radius of 500 mm (20 in.).

31.7.4.8 Infrequently used controls shall be within a radius of 700 mm (28 in.).

31.7.4.9 The movement of controls related to the ship’s motion shall correspond to the direction of desired motion.

31.7.4.10 All controls associated with ship movement shall be located so that the operator faces forward.

31.7.5 Dual Operation—Where two operators must use the same control or display (for example, in monitoring system status), the following criteria shall be applied:

31.7.5.1 If the controls and displays have high priority, duplicate sets shall be provided whenever there is adequate
31.7.5.2 If secondary controls and displays must be shared, they shall be centered between the operators if they are equally important to each operator. If the controls or displays are more important to one operator than to the other, they shall be placed nearest the operator having the principal requirements for using them.

31.7.5.3 If the primary or secondary controls must be operated with the user’s preferred hand (keyboards, keysenders, and so forth), duplicate controls must be provided. Such controls shall not be centered between the operators.

31.7.5.4 Where personnel will work from standing or seated positions, console dimensions shall conform to those of Table 27. However, where smaller consoles are provided, operators shall be spaced no closer than the dimensions shown in Fig. 71.

31.7.6 Sit-Stand Consoles—Where personnel will work from standing or seated positions, console dimensions shall conform to those of Table 27.

31.8 Stairs, Stair-Ladders, Fixed Ladders, and Ramps:

31.8.1 General Criteria:

31.8.1.1 Stairs, stair-ladders, fixed ladders, and ramps shall be provided whenever personnel must abruptly change elevation by more than 305 mm (12 in.).

31.8.1.2 Selection—The selection of stairs, stair-ladders, fixed ladders, or ramps for specific applications shall be based on the angle of ascent required and the criteria in Fig. 80.

31.8.1.3 Provision for Hand-Carrying Equipment—Ramps, elevators, or equivalent means shall be provided when equipment must be hand carried. Ladders shall not be selected in such cases, since both hands shall be free to grasp the ladder. Stairs and steps shall not be used where hand-carrying bulky loads or loads in excess of 13 kg (29 lbs) is required.

31.8.1.4 Handrails and Guardrails—Stairs, stair-ladders, fixed ladders, and ramps shall be equipped with handrails or guardrails or both as described below:

(a) Handrails—A handrail shall be installed on the enclosed side and a guardrail installed on the open side. If both sides are enclosed, handrails shall be installed on both sides if the width of the stair, stair-ladder, or ramp is more than 1118 mm (44 in.). If both sides are open, guardrails shall be installed on both sides. Stairs with three or more steps shall be equipped with handrails or guardrails. Stairs wider than 224 cm (88 in.) shall be equipped with a handrail in the center. Handrails shall be circular, not square or rectangular, and shall be of a diameter and mounting height shown in Figs. 81 and 82.

(b) Guardrails—Guardrails shall be provided at the open side of any surface whenever that surface is 610 mm (24 in.) or higher above the adjacent surface and where a person could fall from the upper to lower surface. The height of all guardrails shall be 1067 mm (42 in.) from the centerline of the top rail to the top of the walking surface. Guardrails shall have at least one intermediate rail and a toe board at least 76 mm (3 in.) high. If one intermediate rail is used, it shall be equal distance between the bottom of the top rail and the top of the toe board. A clearance of 51 mm (2 in.) minimum, 76 mm (3 in.)

FIG. 65 Standing Workspace Dimensions—Cabinets and Electrical Equipment Racks

FIG. 66 Standing Workspace Dimension—CRTs and Table
The recommended guardrail height between the back of the top rail and the nearest object shall be provided. Any opening between adjacent guardrails or between a guardrail and permanent structure greater than 152 mm (6 in.) shall be protected with a chain at each rail height. The chains shall be taut enough so that no more than 25 mm (1 in.) of slack is measured at the chain’s centerspan. Wherever there are changes in walking surface elevations, both of which are protected by guardrails, there shall be transition guardrails provided to protect a person moving from one elevation to another. The transition guardrail may be provided in any manner as long as it maintains the 1067-mm (42-in.) height above the walking surface used to transition between the two walking elevations. If it is possible that material could be placed in an area protected by a guardrail to such a height that the toeboard would not prevent its passing through the guardrails and falling to a lower level, then between rail protection via expanded metal screen, netting, or bars.

**NOTE:** Reduce height values 12.7 cm (5 in) for comfortable use by women.

**FIG. 67 Standing Workspace Dimensions—Consoles and Work Benches**
other suitable material shall be added between the rails to a height equal to that of the expected stacked material.

31.8.2 Tread Color Marking—25 mm (1 in.) at the leading edge of each tread and the face of the tread shall be painted red or yellow (yellow preferred) to make the front edge of each tread visually distinctive from the rest of the tread surface.

31.8.3 Stairs—Stair dimensions shall conform with the recommended values and shall be within the minimum and maximum limits of Fig. 81. Long flights of stairs shall be avoided. There shall be at least one landing for each story 2.44 to 3.66 m (8 to 12 ft) of elevation change, and landings are recommended every ten to twelve treads. Each landing shall be
a minimum of the stairway width and a minimum of 915 mm (36 in.) and a maximum of 1220 mm (48 in.) long measured in the direction of travel. Treads shall be open unless screens or kick plates are required to protect personnel or equipment under the stairs. When personnel carry loads weighing more than 9 kg (20 lbs), or where stairs are more than two stories high, use deep treads, 300 mm (12 in.) and low risers, 125 mm (5 in.).

*Emergency controls should be no more than 53.3 cm (21 in) lateral from centerline of the operator's body.*

---

**FIG. 69 Display (Top) and Control (Bottom) Locations for Standing Crew Work Stations**
31.8.4 **Incline Ladders**—Incline ladder dimensions shall conform with the recommended values and shall be within the specified minimum and maximum limits of Fig. 82. The tread rise shall be open at the rear. Landings shall be provided every tenth or twelfth tread. The surface of treads on exterior stair ladders shall be constructed of open grating material or shall be
31.8.5 Vertical Ladders—Vertical ladder dimensions shall conform with the recommended values and shall be within the specified minimum and maximum limits of Fig. 83 except that rung spacing shall be equal throughout the length of the ladder and the top rung shall be even with the top landing. Ladder stringers shall be 28 to 51 mm (1 1/2 to 2 in.) in diameter. Flat bar shall not be used for ladder stringers.

31.8.5.1 Ladder Clearances—For ladders without cages, the minimum perpendicular horizontal clearance from the rung centerline to the nearest obstruction on the climbing side shall be 762 mm (30 in.). Overhead clearance above the top rung of the ladder shall be 2032 mm (80 in.). The minimum horizontal distance from the ladder centerline to the nearest obstruction on either side of a ladder shall be 381 mm (15 in.). The step-across distance from the back of the ladder rung to the nearest edge of the top landing shall be not less than 64 mm (2 1/2 in.) nor more than 254 mm (10 in.).

31.8.5.2 Ladder Heights—Maximum heights of unbroken ladders shall be 9.12 m (30 ft). Where vertical ladder heights exceed 9.12 m (30 ft), intermediate landings and separate, multiple ladder runs of equal length shall be provided. Exceptions to this requirement are allowed where space does not provide for separate ladder runs, and approval is given by the organization or agency acquiring the ladders to waive this requirement, and the ladder is equipped with a positive climber fall protection device.

31.8.5.3 Ladder Horizontal Spacing—Horizontal spacing between ladder sections described above shall not exceed 457 mm (18 in.) at the point where the climber moves from one ladder section to another.

31.8.5.4 Safety Gates—A self-closing safety gate covering the full width of the vertical ladder opening shall be installed at the top of each vertical ladder.

31.8.5.5 Ladders as Work Platforms—Ladders attached to tanks, pressure vessels, structure, or any object to provide access to a work site that requires the worker to work from the ladder shall be equipped with either a dedicated work platform, a climber safety rail, or a permanent attachment point on the tank, vessel, or structure so the worker can safely secure himself with his climbing harness while completing his tasks.

31.8.5.6 Special Ladder Requirements—Any permanent vertical ladder, regardless of its height, located within 1.84 m (6 ft) of the edge of a deck level which is higher than 914 mm (36 in.) above an adjacent level (measured from the ladder centerline to the break in the deck elevations) shall be equipped with a climber fall safety device to prevent a worker from falling from the ladder to the lower level.

31.8.5.7 Climber Fall Protection Device—Climber fall protection devices shall be installed on all vertical ladders exceeding 4.45 m (15 ft), and positive protection devices (that is, safety rails, cables, bars) shall be installed on all vertical ladders 7.4 m (25 ft) or higher whether they are equipped with cages or not. Where cages are used, they shall extend 914 mm (36 in.) minimum and 1067 mm (42 in.) preferred above the top landing. Climber safety rails, cables, and bars shall run continuously beginning 914 mm (36 in.) above the standing surface at the bottom of the ladder to 1067 mm (42 in.) above the standing surface at the top landing.

31.8.6 Steps—Individual steps, comprised of a tread surface attached directly to a structure, may be used to change vertical elevations anywhere the total rise in height between waling surfaces does not exceed 610 mm (24 in.) and where a stair or ramp is not practical.

31.8.7 Individual Ladder Rungs—Individual circular bar rungs may be attached directly to a bulkhead, tank, or steel structure and used as a vertical ladder provided that the change in vertical height is 3 m (10 ft) or less and that all design requirements for vertical ladder rungs provided in Fig. 83 are satisfied.

31.8.8 Stair and Ladder Attachment—Stairs and ladders may be pinned at the top and bottom for easy removal in locations where their removal would enhance ease of equipment removal for maintenance or replacement. However, stairs or ladders that serve as a required means of egress in emergencies shall be permanently installed.

31.8.9 Spiral Stairs—Spiral stairs shall not be permitted except on tanks or other round structures whose diameter is greater than 2.4 m (8 ft) and when a normal stair design is not practical.

31.8.10 Ramps:

31.8.10.1 Cleating—Where special environmental conditions require cleating of pedestrian ramps, the cleats shall be spaced 360 mm (14 in.) apart and extend from handrail to handrail at right angles to the line of traffic.
31.8.10.2 Mixed Traffic—When a ramp is required for both pedestrian and vehicle traffic, the vehicle-bearing surface shall be located in the center of the ramp, with the pedestrian surface next to the handrails. (A vehicle ramp with an adjacent pedestrian stairway is preferred for this situation.) From the standpoint of space and speed, stairways carry pedestrian traffic more efficiently than ramps do.

31.8.11 Personnel Platforms and Work Areas—The surfaces of exterior personnel platforms and work areas shall be constructed of open metal grating. Exterior personnel platforms, for which utilization of open grating is impractical, and interior walkways shall be treated with nonskid material. All open sides of personnel platforms shall be equipped with guardrails (with intermediate rails), with a top rail height not less than 1.070 m (42 in.) and a toeboard or guard screen height not less than 75 mm (3 in.). Handholds shall be furnished where needed. The distance between the platform edge and the centerline of the railing shall not exceed 65 mm (2.5 in.).

31.8.12 Elevated Work Platform—Where these items are required, the following shall be provided:

31.8.12.1 Maximum load signs, located where they can be easily seen.

31.8.12.2 Guards, to prevent accidental operation of the lift.

31.8.12.3 Limit stops, to prevent injury to personnel and damage to equipment.

31.8.12.4 An automatic failsafe brake or other self-locking device in case of lift mechanism failure.

31.8.12.5 Provision for manually lowering the platform or elevator when feasible.
31.8.12.6 Surface construction or treatment of open platforms, in accordance with 31.8.11.
31.8.12.7 Provision of a work space at least 762 mm (30 in.) wide and 915 mm (36 in.) long.
31.8.12.8 Ability to hold one or two persons (not more than two).
31.8.12.9 Ability to hold the heaviest combination of equipment and personnel (use 250 lbs (118.4 kg)) for each person. A well-designed work platform is shown in Fig. 84.
31.8.12.10 Work platforms shall be located whenever possible so the worker performs his task at the height of 965 to 1270 mm (38 to 50 in.) above the standing surface of the platform.

31.9 Ingress and Egress:
31.9.1 Doors—Sliding or vertical doors are recommended for large vehicles, pieces of equipment, or cargo that must be moved into or out of a compartment. Separate hinged doors shall be inserted into the sliding or vertical doors for personnel use. However, vertical or sliding doors must never be the only exit from an area. There must always be another way to escape. Door dimensions shall be as shown in Fig. 85.
31.9.2 Hatches—Hatches shall be flush with the floor where structural considerations will permit this arrangement.
31.9.2.1 Operation—Hatches shall open with a single motion of the hand or foot.

31.9.2.2 Force Requirements—When a handle is used for unlocking a hatch, the unlocking force required shall not exceed 90 N (20 lbs). Hatches placed in the overhead position shall require no more than 220-N (50-lbs) force for opening and closing and shall be operable by a suitably equipped and clothed user with fifth percentile arm and hand strength. The force of gravity shall be used, where possible, for ease of opening.
31.9.2.3 Locking Mechanisms—Hatches shall have a locking mechanism such that the hatch is locked in the open position as soon as the hatch opens 1.57 rad (90°). The latching mechanism shall require a deliberate effort by a crew member to override before the hatch can be closed. Further, the locking mechanism shall be designed so that the hatch cannot close inadvertently during severe ship motion or wear on the locking mechanism.
31.9.2.4 Access—When an overhead hatch is reached via a ladder, the edge of the hatch opening shall be no more than 203 mm (8 in.) from the face of the ladder rung (see Fig. 86). Hatches mounted in vertical walls shall be sized and located as shown in Fig. 87.
31.9.2.5 *Dimensions*—Hatches shall be sized and located to accommodate the suitably equipped and clothed fifth to ninety-fifth percentile user. Recommended hatch dimensions are shown in Fig. 88 and shall be used unless otherwise specified.

31.9.2.6 *Kick-Out Hatches*—Emergency escape kick-out hatches shall be provided in spaces where it is impractical or impossible to provide a second door or hatch for emergency escape. The kick-out panels shall be clearly marked on both sides, and shall not be covered by furniture, cabinets, equipment, or any other item that could prevent direct and unobstructed access to the panel. Kick-out panels shall be sized and located to accommodate the fifth to ninety-fifth percentile person easily, but in no case shall they be smaller than 725 mm (28 in.) wide and 850 mm (34 in.) high.

31.9.2.7 *Whole-Body Access*—Where rescue of personnel may be required because of environmental hazards (for example, toxic fumes) within the work place, larger access openings for two-person ingress and egress may be necessary. Where step down through a top access exceeds 690 mm (27 in.), appropriate foot rests or steps shall be provided.

31.9.3 *Passing Openings*—Openings provided between compartments for passing printed information by a seated operator shall be between 610 to 635 mm (24 to 25 in.) above the deck. For standing operators, they shall be 920 to 1520 mm (36 to 60 in.) above the deck.

31.10 *Walkways and Passageways*:

31.10.1 *Dimensions*—In machinery spaces, store rooms, and other areas of limited space, the following dimensions shall be provided for walkways and passageways:

31.10.1.1 For one person to walk sideways, 330 mm (13 in.), 410 mm (16 in.), when wearing bulky clothing.

31.10.1.2 For one person to walk forward, minimum walking envelope is shown in the top illustration of Fig. 89. However, where grated walkways or passageways are provided, they shall be at least 510 mm (20 in.) wide and 760 mm (30 in.) if possible. Major passageways for two-way pedestrian traffic shall be a minimum of 914 mm (36 in.) wide. No items (for example, circuit breakers, electrical junction boxes, battle lanterns, and so forth) shall be mounted on the walls or bulkheads of these passageways to reduce the effective width of the passageway less than 914 mm (36 in.). If such items must be mounted to a bulkhead, they shall be mounted as shown. Every effort shall be made to install items 1960 mm (77 in.) or more above the standing deck level. T-butts and other deck mounted equipment with raised foundations shall be recessed into the walkway grating whenever clear walkway widths would be less than 914 mm (36 in.) with the raised foundations.

31.11 *Miscellaneous Work Station Design Requirements*:

31.11.1 *Hand Pumps*—Hand pumps shall be installed so the lowest point of travel for the handle is no lower than 635 ± 25 mm (25 ± 1 in.), nor higher than 1168 ± 25 mm (46 ± 1 in.) above the level on which the pump operator stands. Gratings or other permanent footing shall be provided in front of hand pumps. Hand pumps shall be located so that no obstacles (equipment, piping, guardrails, rotating shafts, and so forth) are between the pump and the pump operators. Where a hand pump is capable of, or required, to be operated by two persons simultaneously, provide sufficient room for both operators to work. Hand pumps shall be located so that the pump face is parallel with the operator’s body (the operator faces the pump handle). Clearance shall be provided around the pump to permit the operator’s body to move during the cranking operation.

31.11.2 *Phone Booths*—Phone booths shall be turned so the opening is at least 1.57 rad (90°) from the noise source. Desk surface of phone booths shall be 94 to 104 cm (37 to 41 in.) above the standing surface. A minimum of 46-cm (18-in.) clearance between the booth face and any obstruction in front of the booth shall be provided.

*The range in "A" is provided to allow latitude in the volume of the lower part of the console; note relationship to "C" and "D."*
31.11.3 Deck Machinery Control:
31.11.3.1 Control Pedestals—Controls mounted on pedestals shall be 104 cm (41 in.) above the deck. Control pedestals for boat davit operation shall be located so that the operator faces the davit but within 76 cm (30 in.) of the emergency brake on boat davit wrench. The pedestal shall be located so that the operator can see the boat in the water.

31.11.3.2 Stores and Cargo Handling—Doors at the load-unload stations for vertical package conveyors, dumbwaiters, and elevators shall open 2.09 rad (120°). Control stations for elevators, package conveyors, and dumbwaiters shall be located on the side of the door opposite the hinges, or above the door opening, and shall be placed so that the operator has an unobstructed view into the trunk when the doors are open. For double-door elevators, the controls shall be located so that the operator has direct access to the emergency shutoff button with the doors open, yet allows the operator to see into the trunk with the doors open. Control stations shall be mounted so that no control is less than 102 cm (40 in.), or more than 152 cm (60 in.), above the deck (for control stations located beside the door) and no higher than 193 cm (76 in.) for stations placed above the door.

31.11.3.3 Emergency Stop Buttons—Emergency stop buttons for deck cranes elevators, vertical package conveyors, and other similar machinery shall be mounted between 114 cm (45 in.) and 135 cm (53 in.) above the deck. They shall be red in color, clearly labeled, and free of any nearby obstructions.

31.11.3.4 Anchor Controls—Speed and brake handwheel controls shall be between 102 to 107 cm (40 to 42 in.) above the deck and at least 61 cm (24 in.) from adjacent ship structures, pipes, and so forth. A 97-cm (38-in.) high safety shield shall be installed between the controls and anchor windlass and capstan.

31.11.3.5 Shore Power Connectors—Shore power connectors shall be no higher than 165 cm (65 in.) above the deck. Connector cables shall be stored as close to the connectors as possible and at least on the same deck level.

32. Environment
32.1 General—To maximize the effectiveness of the human operator/maintainer, the designer must consider the environmental limits to which the system and the human being will be subjected and the potential impact this environment can have on the performance of both the hardware and the human. Once
the designer has identified the limits of the environment (noise, temperature, fumes, vibration, and so forth), the information contained herein shall be used to determine if, and to what extent, the human being can perform the required tasks.

32.2 Temperature:

32.2.1 Effective Temperature Defined—The effective temperature (ET) of an environment is an empirical thermal index that considers how combinations of dry-bulb air temperature, humidity, air movement, and clothing affect people. This temperature may be read from Fig. 90. This chart is based on wearing customary indoor clothing and doing sedentary or light muscular work. It does not include any additional heat stresses from special purpose clothing such as gas masks, chemical protective clothing, or body armor. Likewise, it does not consider radiant heat inputs such as radiation from the sun or equipment components.

32.2.1.1 Maximum Effective Temperature (Air Conditioning)—A maximum effective temperature of 29.5°C (106.5°F) shall be considered for reliable human performance. When air-conditioning systems are necessary to obtain this temperature, they shall be designed such that cold-air discharge is not directed on personnel. The flow of cold air passing the person shall be between 9.1 to 13.7 m (30 to 45 ft) per minute.

32.2.1.2 Minimum Effective Temperature (Heating)—Minimum temperature requirements are dependent upon the tasks to be performed in specific applications. However, within permanent and semipermanent facilities, an effective temperature (ET) of not less than 18°C (65°F) shall be maintained unless dictated otherwise by heavy workload or extremely heavy clothing. When heating systems are provided to maintain this minimum effective temperature, they shall be designed so hot air is not directly discharged on the personnel. Heating shall be provided within mobile personnel enclosures used for detailed work or occupied during extended periods of time to maintain interior dry bulb temperature above 10°C (50°F).

32.2.2 Optimum Effective Temperatures—For maximum physical comfort while normally dressed appropriate to the season climate, the optimum range of effective temperature for accomplishing light work shall be the following:

32.2.2.1 In a warm climate or during summer, 21 to 24°C (70 to 75°F).

32.2.2.2 In a colder climate or during winter, 18 to 21°C (64 to 70°F).

32.2.3 Temperature Variance—The temperature of the air at floor level and at head level shall not differ by more than 5.5°C (10°F). Sidewalls of a compartment shall be kept at equal temperatures insofar as possible with differences of 5°F (11°C) being the maximum allowed.

32.2.4 The effect of temperatures on the physical and mental performance of human beings is shown in Tables 28-30.

32.3 Humidity—Humidity shall be maintained between 20 and 60 % with 40 to 45 % preferred. A good design goal is 45 % relative humidity provided at 21°C (70°F). This value shall decrease with rising temperatures, but shall remain above 20 % to prevent irritation and drying of body tissues, eyes, skin, and respiratory tract. Tolerable humidity-temperature zones are shown in Fig. 90.
FIG. 79 Seated Optimum Manual Control Space
32.4 Wind and Windchill—Fig. 91 depicts the relationship between temperature and wind for various windchill values. Fig. 92 gives the cooling power of wind expressed as “Equivalent Chill Temperature.” Frostbite can occur even in relatively warm temperatures if wind penetrates the layer of insulating air around the body to expose body tissue. A qualitative description of human reaction to windchill values to exposed skin is given in Table 31.

32.5 Thermal Tolerance and Comfort Zones—Temperature and humidity exposure shall not exceed the effective temperature limits given in Fig. 90 when corrected for air velocity (Fig. 91).

32.6 Personal Equipment Thermal Control—When special protective clothing or personal equipment, including full and partial pressure suits, fuel handler suits, body armor, arctic clothing, and temperature-regulated clothing are required and worn, a comfort microclimate between 20°C (68°F), 14-mm (0.6-in.) mercury ambient water vapor pressure and 35°C (95°F), 3-mm (0.1-in.) mercury ambient water vapor pressure is desirable and, where possible, shall be maintained by heat transfer systems.

32.7 Limited Thermal Tolerance Zones—Where hard physical work is to be required for more than 2 h, an environment not exceeding a WBGT or WD index of 25°C (77°F) shall be provided. Where the wearing of protective clothing systems (which reduce evaporation of sweat from the skin) is required, this index shall be decreased 5°C (10°F) for complete chemical protective uniforms, 4°C (7°F) for intermediate clothing systems, and 3°C (5°F) for body armor.

32.8 Ventilation—Adequate ventilation shall be assured by introducing fresh air into any personnel enclosure. If the enclosure volume is 4.25 m³ (150 ft³) or less per person, a minimum of 0.85 m³ (30 ft³) of ventilation air per minute shall be introduced into the enclosure; approximately two thirds shall be outdoor air. For larger enclosures, the air supply per person may be in accordance with the curves in Fig. 93. Air shall be moved past personnel at a velocity not more than 60 m (200 ft) per minute. Where manuals or loose papers are used, airspeed past these items shall be not more than 30 m (100 ft) per minute—20 m (65 ft) per minute if possible, to preclude
pages in manuals from being turned by the air or papers from being blown off work surfaces. Under NBC conditions, ventilation requirements shall be modified as required. Ventilation or other protective measures shall be provided to keep gases, vapors, dust, and fumes within the permissible exposure limits specified by 29 CFR 1910 and the limits specified in the American Conference of Governmental Industrial Hygienists Threshold Limit Values.

32.8.1 CBR Ventilation—Under chemical-bacteriological warfare, all air used for breathing and ventilation will require filtration. Under these conditions, the ambient air temperature can raise as much as 0.75°C (1.5°F). For sedentary persons, a minimum of 0.1 m³ per minute of intake air will provide adequate oxygen and acceptable carbon dioxide concentration.

32.8.2 Ventilation Intakes/Outlets—Intakes for ventilation systems shall be located to minimize the introduction of contaminated air from such sources as exhaust pipes. Ventilation outlets in machinery spaces shall not be located so that air is discharged directly into an access opening for the engine, reduction gear, or other moving machinery.

32.9 Illuminance—Where equipment is to be used in enclosures and is not subject to blackout or special low-level lighting requirements, illumination levels shall be as specified by Table 32 and shall be distributed so as to reduce glare and specular reflection. Capability for dimming shall be provided. Adequate illumination shall be provided for maintenance tasks. General and supplementary lighting shall be used, as appropriate, to ensure that illumination is compatible with each task situation. Portable lights shall be provided for personnel performing
visual tasks in areas where fixed illumination is not provided. For display lighting, see Table 33.

32.10 Reflectance:
32.10.1 General—Large surface areas shall be covered with nonsaturated colors such as tints, pastels, and warm grays that are nonglossy. Some noncritical small areas such as door frames and molding may be glossy if ease of cleaning is essential.

32.10.2 Surface Reflectance Values—Generally recommended surface reflectance values for work places such as control rooms, offices, and maintenance areas are indicated in Fig. 94.

32.11 Dark Adaptation:
32.11.1 General—Dark adaptation is the process by which the eyes become more sensitive in dim light. The eyes adapt almost completely in about 30 min, but the time required for dark adaptation depends on the color curvature of exposure and intensity of the previous light.

32.11.2 White Light—Low-level white light is as compatible for dark adaptation as is red light and permits the use of color coding. Colors often appear different under different types of illumination; so, unless a display will always be used under white light, do not use color coding.

32.11.3 Red Light—Red light may be used to do visual work and for instrument and display markings between 0.07 cd/m² (0.02 ft·L) and 0.35 cd/m² (0.1 ft·L) where maintaining maximum dark adaptation is required. This red light is obtained by passing white light through a filter that transmits only wavelengths longer than 620 mm (24 in.) (red).

32.11.4 Green Light—Where detection by enemy image intensifier night vision devices is a threat or where night vision goggles could be worn by operating personnel while viewing displays or working in a dark adaptive environment, a low-density blue-green light (incandescent filament through a high pass filter with a 600-NM cutoff) may be used for control/display or space lighting.

32.12 Acoustical Noise:
32.12.1 General—Personnel shall be provided an acoustical environment that will not cause personnel injury, interfere with voice or any other communications, cause fatigue, or in any other way degrade overall system effectiveness. The fact that a component which contributes to the overall noise may be government furnished equipment shall not eliminate the requirement that the total system conform to the criteria herein.

32.12.2 Hazardous Noise—Equipment shall not generate noise in excess of maximum allowable levels prescribed herein for the various frequency ranges (see Tables 34-37).
Nonhazardous Noise—Workspace noise shall be reduced to levels that permit necessary direct (person-to-person) and telephone communication and establish an acceptable acoustical work environment. Criteria for workspaces are defined by either the A-sound level (dB(A)) or the preferred speech interference level (PSIL) and are given in 32.12.3.1-32.12.3.6. The A-sound level is the desired requirement. Where it is not possible to meet the specified A-sound level, the corresponding PSIL requirement shall be met. Fig. 95 provides guidance on the relationship between required vocal-effort, speaker-to-listener distance and noise level.

32.12.3.1 General Workspaces—Areas requiring occasional telephone use or occasional direct communication at distances up to 1.5 m (5 ft) shall not exceed 75 dB(A) or 67 dB PSIL or 68 dB PSIL. (Examples: maintenance shops and shelters and shipboard engineering areas.)

32.12.3.2 Operational Areas—Areas requiring frequent telephone use or frequent direct communication at distances up to 1.5 m (5 ft) shall not exceed 65 dB(A) or 57 dB PSIL or 58 dB PSIL. (Examples: operation centers, communication centers, combat information centers, and word processing centers.)

32.12.3.3 Large Workspaces—Areas requiring no difficulty with telephone use or requiring occasional direct communication at distances up to 4.6 m (15 ft) shall not exceed 55 dB(A) or 47 dB PSIL or 48 dB PSIL.

32.12.3.4 Small Office Spaces Special Areas—Areas requiring no difficulty with direct communication shall not exceed 40 dB(A) or 42 dB PSIL or 38 dB PSIL. (Examples: libraries, offices, and command and control centers.)

32.12.3.5 Extreme Quiet Area—Areas requiring extreme quiet shall not exceed 35 dB(A) or 27 dB PSIL or 33 dB PSIL. (Example: medical wards.)

32.12.3.6 Shipboard Areas—Shipboard areas requiring a specified speech communication environment shall not exceed 5 dB above the levels shown in 32.12.3.1-32.12.3.5. Levels for spaces and categories not covered in these paragraphs shall be as given in the detailed shipbuilding specification, or established from the information provided in Tables 38-41.

32.12.4 Facility Design:

32.12.4.1 General Provision—In the design of a workspace or facility, the ambient noise level shall be controlled to the extent feasible through effective sound reduction or attenuation to meet the criteria herein.

32.12.4.2 Attenuation by Materials and Layout—Acoustic materials with high sound-absorption coefficients shall be provided in the construction of floors, walls, and ceiling to effect the required sound control. In the physical design and layout of rooms and work stations, excessive noise shall be attenuated by such means as staggered construction of walls, staggering of doors in corridors or between rooms, and use of thick-paned or double-paned windows.

32.12.5 Reduction of Reverberation Time—When speech communication is a consideration, the acoustical treatment of facilities shall be sufficient to reduce reverberation time, to the applicable limits of Fig. 96.

32.13 Vibration:

32.13.1 Vehicular Vibration—Vehicles or facilities for use on land or sea shall be designed to control the transmission of whole body vibration to levels that will permit safe operation and maintenance as shown in Fig. 97 (see ISO 2631). In the case of multidirectional vibration, each direction shall be evaluated independently with respect to the limits presented.

32.13.2 Whole Body Vibration:

32.13.2.1 Safety Level—To protect human health, whole body vibration shall not exceed twice the acceleration values shown on Fig. 97 for the time and frequencies indicated.

32.13.2.2 Proficiency Level—Where proficiency is required for operational and maintenance tasks, whole body vibration shall not exceed the acceleration values shown on Fig. 97 for the time and frequencies indicated.

32.13.2.3 Comfort Level—Where comfort is to be maintained, the acceleration values shown on Fig. 97 shall be divided by 3.15.

32.13.2.4 Motion Sickness—To prevent motionsickness, very low-frequency vibration shall not exceed the limits of Fig. 98.

32.13.3 Building Vibration—Facilities intended for occupation by humans shall be designed/located to control the transmission of whole body vibration levels that are acceptable to the occupants as specified by ISO 2631.

32.13.4 Equipment Vibration—Where whole body vibrations of the human operator or parts of the body are not a factor, equipment oscillations shall not impair human performance with respect to control manipulations or the readability of numerals or letters. Equipment vibrations in the upper figure of Fig. 97 shall be avoided.

32.14 Noxious Substances:

32.14.1 General—Enclosed crew compartments shall not be susceptible to accumulations of noxious substances generated by shipboard activities (diesel engine and gas turbine exhaust, firing of weapons, and so forth). From the practical standpoint of controlling health hazards, the critical contaminants are carbon monoxide, ammonia, nitrogen oxides, sulphur dioxide, and aldehydes (for example, methane). Other contaminants may also create health hazards, particularly when design changes are introduced or new fuels or propellants are used.

32.14.2 Carbon Monoxide, Ammonia, Nitrogen Dioxide—Carbon monoxide (CO) is particularly dangerous in that it is odorless, colorless, and tasteless and is not ordinarily detectable by the human senses. Excessive exposure can cause loss of mental alertness, disorientation, collapse, and even death. Its effects are cumulative, and doses that may be tolerable by individuals for brief periods can be ultimately dangerous when repeated often over several hours. Ammonia is a pulmonary irritant and asphyxiant and even in small concentrations can cause eye discomfort and watering. Nitrogen dioxide is both a pulmonary irritant and edemogenic agent.

32.14.3 Nitrogen Oxides—Nitrogen oxides can be dangerous because they produce relatively little discomfort, yet even low concentrations can produce grave damage in the lower respiratory tract. Thus, exposed personnel may experience slight irritation while breathing concentrations of nitrogen oxides which will, 12 to 24 h later, prove fatal.

32.14.4 Aldehydes—Aldehydes can cause eye irritation, conjunctivitis, and nausea, causing temporary disability.

32.14.5 Concentrations—The presence of either carbon monoxide or ammonia in concentrations, in excess of that shown below can reduce the effectiveness of personnel and even cause collapse and unconsciousness. Current limits, expressed as a time-weight average (TWA), are as follows:

32.14.5.1 Carbon Monoxide (CO)—25 parts per million (ppm).

32.14.5.2 Ammonia (NH₃)—5 parts per million (ppm).

32.14.5.3 Nitrogen Dioxide (NO₂)—5 parts per million (ppm). The NO₂ limit particularly shall not be exceeded at any time.
32.14.6 Weapon Fumes—The fumes produced when weapons are fired contain carbon monoxide (approximately one third of the volume of fumes produced), oxides of nitrogen, and ammonia.

32.14.7 Exhaust Fumes—The exhaust products of carbon monoxide and carbon dioxide occur no matter which fuel is used.

32.14.7.1 When multifuel engines are using gasoline, the exhaust products include nitrogen, oxygen, and hydrogen.

32.14.7.2 When these engines are operated on CITC, JP4, JP5, or kerosene, the exhaust products include aldehydes, water, hydrogen, and free carbon.

32.14.7.3 When diesel fuel is used, the exhaust products include aldehydes, traces of nitrogen oxides, sulphur compounds, oxygen, nitrogen, and methane. Table 42 shows some of the noxious exhaust products of engine fuels.

32.14.7.4 Ventilation—Careful consideration shall be given in designing compartments where vehicles could be stored and run (such as the well deck of an amphibious ship) to provide sufficient ventilation level, and the direction and dispersion of these products (the exhaust of multifuel engines) shall minimize exhaust concentrations.

32.15 Protection Against Chemical Warfare Agents:

32.15.1 Basic Protection—Ship designs shall be such that in the event of employment of chemical warfare agents, the first consideration must be the adequate protection of the crew members and, second, the maintenance of the ability to
continue operations. The three basic ways to provide protection against CW agents are as follows:

32.15.1.1 Individual Protection—Generally consists of a protective mask, protective clothing, and perhaps a decontamination kit.

32.15.1.2 Collective Protection, Operator or Crew Station—Each operator or crew member wears a protective mask connected to a centrally located gas particulate filter. The operator may or may not require protective clothing.

32.15.1.3 Collective Protection, Overpressure—The collective protection system (CPS) provides an overpressure in the entire personnel-occupied compartment. Protection masks and clothing are not required to be worn if the CPS is operating properly. Selection of the best method to provide protection against CW agents must be based upon the operational considerations, cost effectiveness, and the requirements documentation.

32.15.2 General—For personnel required to be in the environment during the accomplishment of their duties, the protective ensemble is the only feasible way to accomplish the required protection. For other situations, a choice between crew or operator station collective protection and overpressure collective protection must be made.

32.15.3 Overpressure Collective Protection System (CPS)—Whereas all three methods will protect personnel, the CPS has distinct advantages over the other two for interior environments. Primarily, the advantage lies in the fact that the CPS eliminates the requirement for masks and protective clothing to be continually worn inside the protected area as long as the CPS is functioning properly. This eliminates the encumbrance of this equipment and any compatibility problem with equipment to be operated (keyboards, switchboards, telephones, optical equipment, and so forth). Additionally, there is no problem of mask hose interference or reduction of mobility. The advantage of the overpressure system carries over in that the danger of interior compartment contamination is minimized, therefore minimizing the requirement to decontaminate the compartment and its contents. This aspect must not be considered lightly in view that effective decontamination of electronic or optical equipment will be difficult if not impossible in the field, and because of the intimate contact of the personnel with instruments and controls, as well as other interior surfaces of the compartment, contamination of the interior cannot be tolerated. There is the possibility that the CPS will fail or be defeated, meaning that the crew will be required to complete all critical tasks wearing the protective clothing. Therefore, all critical work stations inside the CPS area shall be assigned to be operated and maintained if necessary by personnel wearing the NBC or other protective suits.

32.15.4 Protective Ensemble—Wearing the protective ensemble mask, hood, overgarment, and gloves poses some serious problems in functional efficiency degradation caused by heat stress, loss of visual field (particularly if there is a requirement to use optical equipment), mask lens fogging, reduction of manual dexterity, and an overall degradation in movement caused by the bulk of the protective suit.

32.15.5 Human Factors Implication—Because of the heat buildup in the protective suits, sufficient cooling shall be provided, or the time required for a suit to be worn will be limited so that the environment, delineated in 32.7, shall not be exceeded. Control devices, hand access openings, and so forth, shall be sized in accordance with the dimensions given in Fig. 60, Glove Type B. Limb and LC head movement ranges, wearing an NBC or other protective ensemble, have not been well defined. In lieu of better data, a good design practice is to

place all controls and displays within the normal equipment operation lower limits shown in Fig. 69. As for the anthropometric dimensions of the human body in an NBC or other ensemble, use the dimensions shown in Figs. 53-58 and Table 22 for the arctic-clothed person as a best estimation of the effect of an NBC or other ensemble on the body dimensions for both static and dynamic situations.

33. Maintainability

33.1 General:

33.1.1 Standardization—Standard parts shall be used whenever practicable and shall meet the human engineering criteria herein.

33.1.2 Special Tools—Special tools shall be used only when common hand tools cannot be used or when they provide significant advantage over common hand tools. Special tools required for operational adjustment maintenance shall be securely mounted within the equipment in a readily accessible location.

33.1.3 Modular Replacement—Equipment shall be replaceable as modular packages and shall be configured for removal and replacement by one person where permitted by structural, functional, and weight limitations (see 38.3).

33.1.4 Separate Adjustability—It shall be possible to check and adjust each item, or function of an item, individually.

33.1.5 Malfunction Identification—Equipment design shall facilitate rapid and positive fault detection and isolation of defective items to permit their prompt removal and replacement.

33.1.6 Assembly and Disassembly—Equipment shall be capable of being assembled and disassembled in its operational environment by a minimum number of trained personnel wearing clothing appropriate to the operating environment specified for the system maintenance concept.

33.1.7 Clothing Constraints—Equipment shall be capable of being removed, replaced, and repaired by personnel wearing personal and special purpose clothing and equipment appropriate to the maintenance concept, including NBC protective clothing in an NBC-contaminated environment.

33.1.8 Errorproof Design—Provisions to preclude improper mounting and installation shall include:

33.1.8.1 Physical measures to preclude interchange of items of a same or similar form that are not in fact functionally interchangeable.

33.2.1 Simplification of operator and maintenance functions.
33.2.2 Use of modular or unit packaging or throwaway components designed for rapid and easy removal and replacement by one person (if feasible) with the weight limitations contained in Table 43 in 38.3.1.

33.2.3 Use of self-lubricating principles.

33.2.4 Use of sealed and lubricated components and assemblies.

33.2.5 Use of built-in testing and calibration features for major components.

33.2.6 Use of self-adjusting mechanisms.

33.2.7 Use of gear-driven accessories to eliminate belts and pulleys.

33.2.8 Minimum number and complexity of maintenance tasks.

33.2.9 Design to minimize skills and training requirements of maintenance personnel.

33.2.10 Design for accessibility to all systems, equipment, and components requiring maintenance, inspection, removal, and replacement.

33.2.11 Design for maximum safety and protection for personnel and equipment.

33.2.12 Design to incorporate standard parts to the maximum extent feasible.

33.2.13 Design to facilitate manual handling required during maintenance and comply with established manual force criteria.

33.2.14 Design so inputs to and outputs from each unit shall be kept to a minimum by grouping functions to minimize criss-crossing of signals.

33.3 Mounting of Items Within Units:

33.3.1 Stacking Avoidance—Parts shall be mounted in an orderly array on a “two-dimensional” surface, rather than stacked one on another (that is, a lower layer shall not support an upper layer, so subassemblies do not have to be removed to access other subassemblies within the equipment).

33.3.2 Similar Items—Similar items shall use a common mounting design and orientation within the unit. This mounting design shall preclude interchange of items that are not functionally interchangeable. Similar items that are not functionally interchangeable shall be made distinguishable by labeling, color coding, marking, and so forth, to prevent unwanted substitution.

33.3.3 Delicate Items—Components susceptible to maintenance-induced damage through rough handling, static electricity, abrasion, lack of cleanliness, or other such factors shall be clearly identified and guarded from abuse both physically and by procedural requirements.

33.4 Adjustment Controls—Controls required for maintenance purposes shall comply with basic control design requirements in Sections 23, 24, and 25 and labeling requirements in Section 27.

33.4.1 Knob Adjustments—Knobs rather than screwdriver controls shall be used whenever adjustments occurring more often than once per month must be performed where access, weight, and related considerations permit their use. Knobs shall maintain setting following adjustment.

33.4.2 Blind Screwdriver Adjustments—Screwdriver adjustments made without visual access are permissible only if mechanical guides are provided to align the screwdriver. Screw travel shall be limited to prevent the screw from falling out of its intended position.

33.4.3 Reference Scale for Adjustment Control—A reference scale or other appropriate feedback shall be provided for all adjustment controls. The reference scale shall be readily visible to the person making the adjustment. Mirrors or flashlights shall not be required for adjustment.

33.4.4 Control Limits—Calibration or adjustment controls that are intended to have a limited degree of motion shall have mechanical stops with strength to prevent damage by a force or torque 100 times greater than the resistance to movement within the range of adjustment.

33.4.5 Critical Controls—Critical and sensitive adjustment controls shall incorporate features to prevent inadvertent or accidental actuation. If a locking device is to be used to prevent inadvertent or accidental actuation, operation of the locking device shall not change the adjustment setting. Where the operator or maintainer is subjected to disturbing vibrations or acceleration during the adjustment operation, suitable hand or arm support shall be provided near the control location to facilitate making adjustment.

33.4.6 Hazardous Locations—Adjustment controls shall not be located close to dangerous voltages, moving machinery, or any other hazards. If such location cannot be avoided, the controls shall be appropriately shielded and labeled.
33.5 Environment:

### TABLE 38 Effects of Noise on Human Performance

<table>
<thead>
<tr>
<th>Noise Level, dB</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>Serious reduction in alertness. Attention lapses occur, although attention duration is usually not affected. Temporary hearing loss occurs if no protection is provided in the region 600 to 1200 Hz. Most people will consider this level unacceptable, and 8 h is the maximum duration they will accept.</td>
</tr>
<tr>
<td>95</td>
<td>Considered to be upper acceptance level for occupied areas in which people expect the environment to be noisy. Temporary hearing loss often occurs in the range from 300 to 1200 Hz. Speech will be extremely difficult, and people will be required to shout, even though they may be talking directly into a listener’s ear.</td>
</tr>
<tr>
<td>90</td>
<td>At least half of the people in any given group will judge the environment as being too noisy, even though they expected a noisy environment. Some temporary hearing loss in the range from 300 to 1200 Hz occurs. Skill errors and mental decrements will be frequent. The annoyance factor is high, and certain physiological changes often occur (for example, the pupils dilate, the blood pressure increases, and the stroke volume of the heart may decrease). Listening to a radio is impossible without good earphones. The maximum duration that most people will accept is 8 h.</td>
</tr>
<tr>
<td>85</td>
<td>The upper acceptance level (noise expected) in the range from 150 to 1200 Hz. Some hearing loss occurs in the range from 300 to 1200 Hz. This is considered the upper comfort level, although some cognitive performance decrement can be expected, especially where decision making is necessary.</td>
</tr>
<tr>
<td>80</td>
<td>Conversation is difficult (that is, people have to converse in a loud voice less than 1 ft apart). It is difficult to think clearly after about 1 h. There may be some stomach contraction and an increase in metabolic rate. Strong complaints can be expected from those exposed to this level in confined spaces, and 8 h is the maximum duration acceptable within the frequency range from 1200 to 4800 Hz.</td>
</tr>
<tr>
<td>75</td>
<td>Too noisy for adequate telephone conversation. A raised voice is required for conversant 0.68 cm (2 ft) apart. Most people will still judge the environment as being too noisy.</td>
</tr>
<tr>
<td>70</td>
<td>The upper level for the normal conversation, even when conversants are close together (at a distance of 1.8 m (6 ft)) people will have persons such as industrial workers and shipboard personnel who are used to working in a noisy environment will accept this noise level, unprotected telephone conversation will be difficult (upper phone level is 68 dB). The acceptance level when people expect a generally noisy environment. Intermittent personal conversation is acceptable. About half of the people in a given population will experience difficulty sleeping.</td>
</tr>
<tr>
<td>65</td>
<td>The upper limit for spaces used for dining, social conversation, and sedentary recreational activities. Most people will rate the environment as “good” for general daytime living conditions.</td>
</tr>
<tr>
<td>60</td>
<td>The upper acceptance level for spaces in which quiet is expected (150 to 2400 Hz). People will have to raise their voices slightly to converse over distances greater than 2.4 m (8 ft). This level of noise will awaken about half of a given population about half of the time. It is still annoying to people who are especially sensitive to noise.</td>
</tr>
<tr>
<td>55</td>
<td>Acceptable to most people where quiet is expected. About 25% will be awakened or delayed in falling asleep. Normal conversation is possible at distances up to 2.4 m (8 ft).</td>
</tr>
<tr>
<td>50</td>
<td>Very acceptable to all. The recommended upper level for quiet living spaces, although a few people may still have sleep problems.</td>
</tr>
<tr>
<td>Below 30</td>
<td>Introduces additional problems: low-level intermittent sounds become disturbing. Some people have difficulty getting used to the extreme quiet, and a few may become psychologically disturbed.</td>
</tr>
</tbody>
</table>

**33.5.1 Heat**—When monitoring, servicing, repair, or other similar maintenance tasks will be performed in areas in which the temperature will exceed 29.5°C (85°F), air conditioning shall be provided. For additional information on the effect of heat on human performance and behavior see 32.2.

**33.5.2 Cold**—Personal discomfort increases rapidly as the temperature drops below −12°C (10°F). When workers are properly dressed, they can perform to some point between 0 and −18°C (32 and 0°F) for 30 min without interference from cold itself. Below −18°C (0°F), the decrement in human performance rapidly increases as the temperature decreases. For additional information on the effects of cold temperatures on human performance see Tables 29-31.

**33.5.3 Design Features**—The following features shall be considered when equipment can be expected to require maintenance in cold weather.

- **33.5.3.1** Provide for drying of equipment which is to be returned to out-of-door arctic temperatures after shop maintenance has been performed on it. Moisture that has condensed on such equipment will cause it to freeze with possible resultant damage to equipment and subsequent increased maintenance.

- **33.5.3.2** Winterization equipment, such as preheaters, shall be positioned where they do not interfere with maintenance accessibility to perform maintenance tasks.

- **33.5.3.3** In locating access doors and panels, consider the effects of rain, snow, and formation of ice.

- **33.5.3.4** Provide work space access openings to accommodate personnel wearing cold weather clothing.

- **33.5.3.5** Provide drains that can be adequately accessed and operated by personnel wearing cold weather clothing to drain liquids as required to prevent damage caused by freezing.

**33.6 Mounting of Items Within Units.**

### 34. Accessibility

**34.1 General**—Proper accessibility is a fundamental requirement for good maintainability, and must be designed into the equipment and overall system. Accessibility means that all activities required can be completed by personnel using the appropriate body dimensions (see Section 30, Anthropometry), fifth to ninety-fifth percentile, wearing the appropriate clothing and carrying (or using) all necessary tools or test equipment, or both. Just because an item can be eventually reached (provided enough other items are removed, or valve handles or lagged piping has to be used as a “step ladder,” and so forth) does not mean the item is accessible.

**34.2 Psychological Aspects**—The more difficult or involved a maintenance task is, the more readily an operator or mechanic will put it off in preference to less demanding tasks. Periodic maintenance activities, such as checks, adjustments, or general troubleshooting may be unduly postponed or neglected entirely.

**34.3 Physical Access**—Consideration must be given to the position of the maintenance person with respect to the equipment and the task therein while performing the particular maintenance task. When the maintenance activities require the crew member to squat, sit down, stand sideways, proper accessibility shall be provided (see Figs. 99-103).

**34.4 Access Openings**—Provide access openings, as required, to all points, items, units, and components that require testing, servicing, adjusting, removing, replacing, and repairing. The type, size, and location of these openings (Figs. 104-106) shall be based on the following:

- **34.4.1** Operational location, setting, and environment of the unit.

- **34.4.2** Frequency of use.

- **34.4.3** Maintenance tasks performed through the access; the intricacy of tasks.

- **34.4.4** Time allotted to perform maintenance function.

- **34.4.5** Types of tools/accessories required.

- **34.4.6** Work space required.

- **34.4.7** Type of clothing the maintainer is likely to be wearing.

- **34.4.8** Necessary access reach (position of the human body; standing, squatting, lying prone, and so forth, must be considered in determining access reach).

- **34.4.9** Visual requirements; the intricacy of tasks.

**34.5 Visual Access with Physical Access**—If it is necessary for the technicians to see what they are doing, either access openings large enough to accommodate hand, arms, tools, and so forth, and still leave an adequate view, or an auxiliary viewing port shall be provided.

**34.6 Structural Members**—Structural members of units or chassis shall not prevent access to or removal of items. Replaceable items shall not be mounted in a manner that will make them difficult to remove. Where accessibility depends upon removal of panels, cases, and covers, measures shall be taken to ensure that such items are not blocked by structural members or other items.

**34.7 Large Items**—Large items that are difficult to remove shall be so mounted that they will not prevent convenient access to other items. Smaller, or more fragile, items shall be located so as not to be easily damaged during removal of the large items.

**34.8 Use of Tools and Test Equipment**—Check points, adjustment points, test points, cables, connectors, and labels shall be accessible and visible during maintenance. Sufficient space shall be provided for the use of test equipment and other required tools without difficulty or hazard.

**34.9 Rear Access**—Sliding, rotating, or hinged equipment to which rear access is required shall be free to open or rotate their full distance and remain in the open position without
being supported by hand. Rear access shall also be provided to plug connectors for test points, soldering, and pin removal where connectors require such operations.

34.10 Relative Accessibility—Items most critical to system operation and which require rapid maintenance shall be most accessible. When relative criticality is not a factor, items requiring most frequent access shall be most accessible.

34.11 High-Failure-Rate-Items—High-failure-rate items shall be accessible for replacement without moving nonfailed items. Mechanical replacement items shall be removable with common hand tools and simple handling equipment.

34.12 Skills—Access to items maintained by one technician shall not require removal of critical equipment maintained by another technician, particularly where highly specialized skills are involved.

34.13 Moving Parts—Maintenance tasks shall not be required on items for which the human must lean over or work directly around moving parts (belts, elevator cables, rotating shafts, and so forth), especially if it is necessary to have the moving parts active as a part of the maintenance procedure.

34.14 Elevated Positions—Items to be maintained from a ladder shall require only one hand and shall be located no more than 1219 mm (48 in.) from the ladder (see Fig. 40). Maintenance tasks performed at this maximum distance shall involve only adjustments or other similar tasks that can be performed with the bare hand or light tools.

34.15 Masts—Maintenance on antenna, lights, and so forth, mounted on a mast or other elevated structure, shall not require the person to be suspended from a safety harness, but rather shall be performed from a permanent or temporary work platform.

34.16 Strainers and Filters—Strainers and filters shall be located so that the person does not have to stand on valve handles, piping, wireway supports, and so forth to obtain access to the elements inside for removal for cleaning.

34.17 Rechargeable Containers—Compressed gas bottles for inert gases (nitrogen flasks in oil and water test labs), fire-extinguishing materials, and so forth, shall be located in a compartment or space to facilitate easy and quick removal.

34.18 Access Opening Covers—Where an access opening is provided the order of preference, as shown in Fig. 106, shall be followed regarding the provision of an access cover.

34.18.1 Securing of Covers—It shall be made obvious when a cover is not secured even though it may be in place.

34.18.2 Self-Supporting Covers—Hinged access covers that are not completely removable shall be self-supporting in the
open position. The cover in the open position shall not obstruct required visual or physical access to the equipment being maintained or to related equipment during maintenance. Self-supporting covers shall be capable of being opened and closed.

FIG. 97 Vibration Exposure Criteria for Longitudinal (Upper Figure) and Transverse (Lower Figure) Directions with Respect to Body Axis

NOTE: Exposure limits are presented as a function of frequency (pure sinusoidal vibration or Rms vibration values in third octave bands) with exposure time as a parameter.
with one hand. Covers shall be secured to withstand wind gusts, vibrations, or other environmental effects as specified by system requirements.

34.18.3 Instructions—If the method of opening a cover is not obvious from the construction of the cover itself, instructions shall be permanently displayed on the outside of the cover. Instructions shall consist of simple symbols such as arrows or simple words such as “push” or “push and turn.”

34.18.4 Clearance—Bulkheads, brackets, and other equipment shall not obstruct visual or physical access for removal or opening of covers on equipment within which work must be performed in the installed condition. Covers, doors, or panels that must be opened to perform onsite maintenance shall be visually and physically accessible to the maintainers.

34.18.5 Labeling—Each access cover shall be labeled with nomenclature for items visible or accessible through it, nomenclature for auxiliary equipment to be used with it, and recommended procedures for accomplishing operations. Accesses shall be labeled with hazard signs advising of any hazards existing beyond the access. If instructions applying to a covered item are lettered on a hinged door, the lettering shall be properly oriented to be read when the door is open. Hazard notices shall be prepared in accordance with 29.2.

34.18.6 Access Cover Attachment—Covers shall be attached with the fewest number of simplest-to-operate fasteners practicable. Fasteners shall be operable by hand or by common hand tools in that order of preference. Small, removable covers shall be attached to structure or otherwise retained to prevent loss.

34.19 Rounding—Cover and access edges shall be rounded (see 51.7.4, Edge Rounding) to preclude hand injury or clothing damage.

34.20 Operation—Access covers shall be equipped with grasp areas or other means for opening them. If a hazardous condition, such as exposed conductors energized with dangerous voltages exists behind the access, the physical barrier over the access shall be equipped with an interlock that will deenergize the hazardous equipment when the barrier is opened or removed. Bulkheads, brackets, wireways, and other equipment shall not interfere with the removal or opening of covers, or restrict access to these openings, or interfere with the maintenance tasks that must be performed through the openings. Additional design criteria are as follows:

34.20.1 When hinged covers are adjacent, they shall open in the opposite directions to maximize accessibility.

34.20.2 Design hinged caps over service or test points so they will not interfere with inserting or attaching service or test equipment.

34.20.3 Use stops, retainers, and so forth, as necessary to keep covers from swinging into adjacent controls or fragile components, and so they will not spring their hinges.
34.20.4 Sliding covers or caps are particularly useful where swinging space is limited. Small sliding caps are useful for small accesses that do not require a tight seal. When sliding covers are used, the following shall be considered:

34.20.4.1 Sliding doors and caps shall lock positively.
34.20.4.2 They shall be designed so that they will not jam or stick.
34.20.4.3 They shall be easy to use, and personnel shall be able to use them without tools and with heavy gloves.

34.21 Removable covers, plates, or caps require little space for opening and, once removed, do not interfere with work space. However, handling them takes time and effort. When using removable covers, consider the following:

34.21.1 Use tongue-and-slot or similar catches wherever possible for small covers and caps to minimize the number of fasteners required.
34.21.1.1 If small covers and caps are likely to be misplaced or damaged, secure them with retainer chains.
34.21.1.2 If a removable cover must be attached in a certain way, design it so it cannot be attached improperly (use an asymmetric shape, locate mounting holes asymmetrically, or code both cover and structure with labels that will align when the plate is properly installed).

34.22 Location of Access Covers—Accesses shall be located only on equipment surfaces that are directly accessible when normally installed.

34.23 Physical Access:

34.23.1 Arm and Hand Access—Access openings provided for adjusting and handling interior equipment shall be sized to permit the required operations and shall provide an adequate view of the item being manipulated. All blind arm and hand access shall require approval of procuring authority.

34.23.2 Opening Covers—Access covers shall be equipped with grasp areas or other means for opening them. Where operations will require opening and closing the covers while wearing gloves or special clothing, opening provision shall accommodate the gloves or special clothing.

34.23.3 Reach Access Dimensions—The dimensions of access openings for arms, hands, and fingers shall be no less than those shown in Figs. 99-105. Allowance shall be made for the clearance of the operator’s gloved or mitten hand or special clothing as appropriate. Shape of access shall allow easy passage of equipment, body appendage, or tools as appropriate. Access shape shall permit passage of all equipment that must be replaced through the opening allowing for protuberances, attachments, and handles on the equipment.

34.23.4 Tool Access Dimensions—Access openings shall be large enough to operate tools required for maintenance of the equipment reached through the access.

34.23.5 Remove and Replace Dimensions—Opening size for removal and replacement of equipment shall allow for handling clearance for bare hand or gloved hand as appropriate.

34.23.6 Guarding Hazardous Conditions—If a hazardous condition, such as exposed conductors energized with dangerous voltages or currents, exist behind the access, the physical barrier over the access shall be equipped with an interlock that will deenergize the hazardous equipment when the barrier is open or removed. Both the presence of the hazard and the fact that an interlock exists shall be noted on the equipment case or cover such that it remains visible when the access is open.

34.23.7 Type of Opening—Where physical access is required, the following practices shall be followed in order of preference:

34.23.7.1 An opening with no cover unless this is likely to degrade system performance, safety, or NBC contamination survivability.

34.23.7.2 A hand-operated (latched, sliding, or hinged) cap or door where dirt, moisture, or other foreign materials might otherwise create a problem.

34.23.7.3 A quick-opening cover plate using 1/4-turn captive fasteners if a cap will not meet stress requirements or space prevents a hinged cover.

34.23.7.4 When captive fasteners cannot be used because of stress, structure, or pressurization, screw down cover. Use minimum number of interchangeable screws to fasten door.

34.24 Visual Access—Where visual access is required, the opening shall provide a visual angle sufficient to view all required information at the normal operating or maintenance position. The maintainer shall be provided unrestricted visual access from the work station without bending. Where bending is required, frequency and time in the bent position shall not cause fatigue. Where visual access only is required, the following practices shall be followed in order of precedence:

34.24.1 An opening with no cover except where this might degrade system performance or NBC survivability.

34.24.2 A transparent window if dirt, moisture, or other foreign materials might otherwise create a problem.

34.24.3 A break-resistant glass window if physical wear, heat, or contact with solvents would otherwise cause optical deterioration.

34.24.4 A quick-opening metal cover if glass will not meet stress or other requirements.

35. Cases

35.1 Orientation—The proper orientation of an item within its case shall be made obvious, either through design of the case or by means of appropriate labels.

35.2 Removal—When practical, cases shall be designed to be lifted from items rather than items lifted from cases (see Fig. 107). Equipment shall be protected from damage when cases are removed or replaced; cases shall not require manual support to remain in the open position during maintenance.
35.3 **Size**—Cases shall be sufficiently larger than the items they cover to minimize the possibility of damaging wires or other parts when the cases are put on or taken off.

35.4 **Guides**—Guides, tracks, and stops shall be provided as necessary to help align the case to prevent damage to equipment or injury to personnel.

35.5 **Weight**—They shall be removable and transportable by one hand, by one person, or by two persons, in that order of preference.

35.6 **Handles**—Handles or tool grips, in accordance with 38.5, shall be provided if the case is heavy, difficult to open, or difficult to handle.

36. **Lubrication**

36.1 **General**—Configuration of equipment containing mechanical items requiring lubrication shall permit both lubrication and checking of lubricant levels without disassembly.
Where fittings are not directly accessible (for example, around steering gear stocks and around inside vertical package conveyors, and so forth), these fittings shall be extended via tubing to a location where they are directly accessible. Permanently lubricated items for which lubricant lasts for the life of the items are excluded.

36.2 Labeling—Where lubrication is required, the type of lubricant to be used and the frequency of lubrication may be specified via a lubrication chart of permanent construction mounted at or near the lube port or at the operator station of the equipment. A lubrication chart of permanent construction shall be mounted at the operator station of the equipment; lubrication charts or individual labels shall not be required when the equipment has only one type of fitting and uses only one type of lubricant.

37. Fasteners

37.1 General—The number and diversity of fasteners used shall be minimized commensurate with stress, bonding, pressurization, shielding, thermal, and safety requirements. Finger- or hand-operated fasteners shall be used when consistent with these requirements, except where screws with heads flush with the case or fastening surface are required for NBC survivability. Fasteners requiring nonstandard tools shall not be used. Fasteners used on items requiring use by NBC-suited personnel shall be quick acting, with no sharp edges or protrusions that could puncture or tear the NBC suit.

37.2 Hinges and Tongue-and-Slot Catches—Optimum use shall be made of hinges and tongue-and-slot catches to minimize the number of fasteners required.

37.2.1 Captive Fasteners—Captive fasteners shall be used where dropping or loss of such items could cause damage to equipment or create a difficult or hazardous removal problem. Captive fasteners shall also be provided for access covers requiring frequent removal.

37.2.2 Quantity—If a hinged access panel or quick-opening fasteners will not meet stress, pressurization, shielding, or safety requirements, the minimum number consistent with these requirements shall be used.

37.2.3 Fastener Head Type:

37.3 High-Torque Fasteners—External hex or external double-hex wrenching elements shall be provided on all machine screws, bolts, or other fasteners requiring more than 14 N·m (10 ft·lb) of torque. When external wrenching fasteners cannot meet the mechanical function or personnel safety requirements, or in limited access situations, and where use is protected from accumulation of foreign material, internal wrenching fasteners may be used.

37.4 Low-Torque Fasteners—Hex-type internal grip head, hex-type external grip head, or combination head (hex or straight-slot internal grip and hex-type external-grip head), or torque-set fasteners shall be provided where less than 14 N·m (10 ft·lb) torque is required; however, internal-grip head fasteners shall be provided only where a straight or convex smooth surface is required for mechanical function or for personnel safety and where use is protected from accumulation of foreign material (such as ice or snow). Straight-slot or Phillips-type internal grip fasteners shall not be provided except as wood fasteners or where these type fasteners are provided on standard commercial items.

37.5 Common Fasteners—Identical screw and bolt heads shall be provided to allow various panels and components to be removed with one type of tool. Combination bolt heads such as the slotted hex head shall be selected whenever feasible.

37.6 Accessibility—The heads of mounting bolts and fasteners shall be located on surfaces directly accessible to the technician.

37.7 Number of Turns—Fasteners for mounting assemblies and subassemblies shall require only one complete turn,
provided that stress, alignment, positioning, and load considerations are not compromised. When machine screws or bolts are required, the number of turns and the amount of torque shall be no more than necessary to provide the required strength except when a common fastener is used.

37.8 Torque Labeling—When fastener torqueing to meet EMI/RFI shielding, thermal conductance, or other constraints is required for organizational or intermediate-level maintenance actions, an instructional label or placard shall be provided in reasonable proximity to fasteners. Labels shall comply with requirements of Section 28.

37.9 Types of Fasteners (In Order of Preference):

37.9.1 Quick Connect-Disconnect Devices—These devices are fast and easy to use, do not require tools, may be operated with one hand, and are very good for securing plug-in components, small components, and covers. However, their power is low, and they cannot be used where a smooth surface is required. The following factors shall be considered in selecting quick connect-disconnect fasteners:

37.9.1.1 Use these fasteners wherever possible when components must be dismantled or removed frequently.

37.9.1.2 These fasteners must fasten and release easily, without requiring tools.

37.9.1.3 They shall fasten or unfasten with a single motion of the hand.

37.9.1.4 It shall be obvious when they are not correctly engaged.

37.9.1.5 When there are many of these fasteners, prevent misconnections by giving the female section a color or shape code, location, or size so it will be attached only to the correct male section.

37.9.2 Latches and Catches—These items are very fast and easy to use, do not require tools, and have good holding power; especially good for large units, panels, covers, and cases. They cannot be used where a smooth surface is required. The following factors shall be considered in selecting quick connect-disconnect fasteners:

37.9.2.1 Use long-latch catches to minimize inadvertent releasing of the latch.

37.9.2.2 Spring-load catches so they lock on contact, rather than requiring positive locking.

37.9.2.3 If the latch has a handle, locate the latch release on or near the handle so it can be operated with one hand.

37.9.2.4 Evaluate latches/catches for snap down/release forces that could be hazardous to hand during operation.

37.9.3 Captive Fasteners—Captive fasteners are slower and more difficult to use, depending upon type, and usually require using common hand tools; but they stay in place, saving time that would otherwise be wasted handling and looking for bolts and screws; can be operated with one hand. The following factors shall be considered in selecting captive fasteners:

37.9.3.1 Use captive fasteners when lost screws, bolts, or nuts might cause a malfunction or excessive maintenance time.

37.9.3.2 Use fasteners that can be operated by hand or with a common hand tool.

37.9.3.3 Use fasteners that can be replaced easily if they are damaged.

37.9.3.4 Captive fasteners of the quarter-turn style shall be self-locking and spring-loaded.

37.9.4 Regular Screws—Round, square, or flat-head screws take longer to use and are subject to loss, damage, stripping, and misapplication. Square-head screws are generally preferable to round or flat ones; they provide better tool contact, have sturdier slots, and can be removed with wrenches. If personnel must drive screws blindly, provide a guide in the assembly to help keep the screwdriver positioned properly. The following factors shall be considered in the selection of screws:

37.9.4.1 Screw heads shall have deep slots that will resist damage.

37.9.4.2 Use screws only when personnel can use screwdrivers in a straight-in fashion; do not require personnel to use offset screwdrivers.

37.9.5 Bolts and Nuts—Bolts are usually slow and difficult to use. Personnel must have access to both ends of the bolt, use both hands, and often use two tools. Also, starting nuts require precise movements. There are many loose parts to handle and lose (nuts, washers, and so forth). Design considerations shall include the following:

37.9.5.1 Keep bolts as short as possible, so they will not snag personnel or equipment.

37.9.5.2 Coarse threads are preferable to fine threads for low torques and reduce the possibility of cross threading.

37.9.5.3 Avoid left-hand threads unless system requirements demand them; then identify both bolts and nuts clearly by marking, shape, or color coding.

37.9.5.4 Use wing nuts (preferably) or knurled nuts for low-torque applications, because they do not require tools.

37.9.6 Combination-Head Bolts and Screws—Combination-head bolts and screws are preferable to other screws or bolts, because they can be operated with either a wrench or a screwdriver, whichever is more convenient, and there is less danger of damaged slots and stuck fasteners. In general, slotted hexagon heads are preferable to slotted knurled heads.

37.9.7 Internal-Wrenching Screws and Bolts—Internal-wrenching screws and bolts (socket heads) allow higher torque, better tool grip, and less wrenching space; but they require special tools, are easily damaged, and are difficult to remove if damaged. They also become filled with ice and frozen mud. The following factors shall be considered in selecting internal-wrenching fasteners:

37.9.7.1 Minimize the number of different sizes to minimize the number of special tools; preferably, use only one size.

37.9.7.2 Select fasteners with deep slots to reduce the danger of damaged fasteners.

37.9.8 Rivets—Rivets are very hard and time-consuming to remove. They shall not be used on any part that may require removal.

37.9.9 Cotter Key—Cotter key users shall consider the following:

37.9.9.1 Keys and pins shall fit snugly, but they shall not have to be driven in or out.

37.9.9.2 Cotter keys shall have large heads for easy removal.

37.9.10 Safety Wire:
37.9.10.1 Use safety wire only where self-locking fasteners cannot withstand the expected vibration or stress.
37.9.10.2 Attach safety wire so it is easy to remove and replace.
37.9.11 Retainer Ring:
37.9.11.1 Avoid rings that become difficult to remove and replace when they are worn.
37.9.11.2 Use rings that hold with a positive snap action when possible.
37.9.12 Retainer Chains—The following are uses and considerations for selection of retainer chains:
37.9.12.1 Keep hatches or doors from opening too far and springing their hinges.
37.9.12.2 Turn doors or covers into useful shelves for the technician.
37.9.12.3 Prevent small covers, plates, or caps from being misplaced.
37.9.12.4 Secure small, special tools where they will be used.
37.9.12.5 Secure objects that might fall and injure personnel.
37.9.12.6 Secure removable pins to prevent loss.
37.9.12.7 Use link, sash, or woven-mesh chains. Avoid bead-link chain, because it breaks more easily than other types.
37.9.12.8 Attach chains with screws or bolts; attach them strongly and positively, but so they can be disconnected easily when required.
37.9.12.9 Provide eyelets at both ends of the chain for attaching to the fasteners.
37.9.12.10 Chains shall not be longer than their function requires.

38. Unit Design for Efficient Manual Handling

38.1 Rests and Stands—When required to support operations or maintenance functions, rests or stands on which units can be placed, including space for test equipment, tools, technical orders, and manuals, shall be provided. When permitted by design requirements, such rests or stands shall be part of the basic unit, rack, or console chassis.
38.2 Extensions—Extensions and connected appurtenances, accessories, utilities, cables, wave guides, hoses, and similar items shall be designed for easy removal or disconnection from the equipment before handling.
38.3 Weight Lifting and Carrying Limits:
38.3.1 Lifting Limits—The weight limits in Table 43, Conditions A and B, shall be used as maximum values in determining the design weight of items requiring one person lifting with two hands. Double the weight limits in Table 43 shall be used as maximum values in determining the design weight of items requiring two-person lifting, provided the load is uniformly distributed between the two lifters. If the weight of the load is not uniformly distributed, the weight limit applies to the heavier lift point. Where three or more persons are lifting simultaneously, not more than 75 % of the one-person value may be added for each additional lifter, provided that the object lifted is sufficiently large that the lifters do not interfere with one another while lifting. Where it is not possible to define the height to which an object will be lifted in operational use, the limit wherein the object is lifted to shoulder height shall be used rather than the more permissive bench height. The values in Table 43 are applicable to objects with or without handles.
38.3.2 Lifting Frequency—The equipment weight limits in Table 43 are not for repetitive lifting as found, for example, in loading or unloading transport vehicles. If the frequency of lift exceeds one lift in 5 min or 20 lifts per 8 h, the permissible weight limits shall be reduced by (8.33 × LF) %, where LF is the lift frequency in lifts per minute. For example, if the lift frequency is six lifts per minute, then the maximum permissible weight is reduced by 50 % (8.33 × 6 = 50).
38.3.3 Load Size—The maximum permissible weight limit in Table 43 are applicable to an object with uniform mass distribution and a compact size not exceeding 460 mm (18 in.) high, 460 mm (18 in.) wide, 300 mm (12 in.) deep (away from the lifter). This places the hand holds at half the depth, or 150 mm (6 in.) away from the body. If the depth of the object exceeds 610 mm (24 in.), the permissible weight shall be reduced by 33 %. If the depth of the object exceeds 910 mm (36 in.), the permissible weight shall be reduced by 50 %. If the depth of the object exceeds 1,220 m (48 in.), the permissible weight shall be reduced by 66 %.
38.3.4 Obstacles—The values in Table 43 assume that there are no obstacles between the person lifting and the shelf, table, bench, or other surface on which the object is to be placed. Where there is a lower protruding shelf or other obstacle limiting the lifter’s approach to the desired surface, the weight of the limit of the object shall be reduced by 33 % for an obstacle exceeding 300 mm (12 in.) in depth, 50 % for an obstacle exceeding 460 mm (18 in.), and 66 % for an obstacle of 610 mm (24 in.). If the allowable weight must be reduced by both oversize load considerations (38.3.3) and the obstacle considerations, only the more restrictive single value shall apply; two reductions shall not be applied.
38.3.5 Carrying Limits—The weight limit in Table 43 Condition C shall be used as the maximum value in determining the design weight of items requiring one person carrying objects a distance of up to 10 m (33 ft). The maximum permissible weight for carrying also applies to an object with a handle on top, such as a tool box, which usually is carried at the side with one hand. Double this weight-carrying limit shall be used as the maximum value in determining the design weight of items requiring two-person carrying, provided the load is uniformly distributed between the two carriers. Where three or more persons are carrying a load together, not more than 75 % of the one-person value may be added for each additional person and provided that the object is sufficiently large that the workers do not interfere with one another while carrying the load. In all cases involving carrying, it is assumed that the object is first lifted from the floor, carried a distance of up to 10 m (33 ft) or less and placed on the floor or on another surface not higher than 915 mm (36 in.). If the final lift is to a higher height, the 1.525-m (5-ft) lift height applies as the more limiting case.
38.3.6 Carrying Frequency—The reduction formula expressed in 38.3.2 shall be applied to repetitive carrying in the same manner as for repetitive lifting.
38.3.7 User Population—Unless otherwise specified by the procuring activity, the values in Table 43 for male and female
population shall apply to any object to be lifted or carried manually. Where the procuring activity specifies that the object is to be lifted or carried only in a combat environment, the male only population will be applied.

38.3.8 Labeling—Items weighing more than the one-person lift or carry values for male and female population of Table 43 shall be prominently labeled with weight of the object and lift limitation, that is, mechanical or two-person lift, three-person lift, and so forth. Where mechanical or power lift is required, hoist and lift points shall be provided and clearly labeled.

38.4 Push-and-Pull Forces:

38.4.1 Horizontal—Manual horizontal push-and-pull forces required to be applied initially to an object to set it in motion or to be sustained over a short period of time, shall not exceed the values of Fig. 108, as applicable. The values shown in Fig. 108 apply to males only and shall be modified for females. (Two thirds of each value shown is considered to be a reasonable adjustment). Use of the maxima shown in Fig. 108 is predicted upon a suitable surface for force exertion, vertical with rough surface, and be approximately 400 mm (16 in.) wide and between 51 and 127 cm (20 and 50 in.) above the floor to allow force application with the hands, the shoulder, or the back.

38.4.2 Vertical—Manual vertical push-and-pull forces required shall not exceed the applicable fifty percentile peak or mean force values of Table 44.

Mean force            | 595 (134)     | 242 (64)        |
Peak force            | 699 (157)     | 285 (64)        |

Seated two-handed pull: 50-cm (20-in.) level
Mean force            | 525 (118)     | 204 (46)        |
Peak force            | 596 (134)     | 237 (53)        |

38.5 Handle Dimensions—Handles that are to be used with mittened, gloved, or ungloved hands shall equal or exceed the minimum applicable dimensions shown in Fig. 109.

38.5.6 Handle Grasp Area Force Requirements—Force requirements to operate handle and grasp areas shall be in Section 21, Controls, General Information.

38.5.7 Handle Material—Handles or grasp areas used with bare hands shall have surfaces that are not thermally or electrically conductive. The surface shall be sufficiently hard to prevent imbedding of grit and grime during normal use.

38.5.8 Shape—Use hand-shape handles when items must be carried frequently or for long periods.

38.5.9 Hoist Lugs—Lifting eyes shall be provided on all equipment weighing more than 68 kg (150 lbs) with a minimum of 100 mm (4 in.) of space around the eye.

39. Handwheel Torque

39.1 Handwheel Torque—Fig. 110 contains information on desirable upper limits for handwheel torque. This data was from a very small sample and the most conservative values were used. Female values were extrapolated and are 60% of the male values. This information may be used for guidance in designing handwheels.

40. Equipment Mounting

40.1 General—Equipment items shall be designed so that they cannot be mounted improperly. Code, label, or key symmetrical components to indicate proper orientation for mounting or installation.

40.2 Tools—Field-removable items shall be replaceable by use of nothing more than common hand tools.

40.3 Removal—Replaceable items shall be removable along a straight or slightly curved line, rather than an angle.

40.4 Alignment—Guide pins or their equivalent shall be provided to assist in alignment during mounting, particularly on modules that are connectors themselves.

40.5 Coding—All replaceable items shall be coded (keyed) so that it will be physically impossible to insert a wrong item. Coding by such means as color or labels shall identify the correct item and its proper orientation or replacement.

40.6 Rollout Racks, Slides, or Hinges—Items that are frequently pulled out of their installed positions for checking shall be mounted on rollout racks, slides, or hinges. Rollout racks shall not shift the center of gravity to the extent that the entire rack or console falls. If this possibility exists, the console or rack shall be safely secured. The rollout racks shall operate with a force less than 178 N (4 lbs).

40.7 Limit Stops—Limit stops shall be provided on racks and drawers which are required to be pulled out of their installed positions for checking or maintenance. The limit stop design shall permit convenient overriding of stops for unit removal.

40.8 Interlocks—Where applicable, interlocks shall be provided to ensure disconnection of equipment that would otherwise be damaged by withdrawal of racks or drawers.

40.9 Hinged Mounting—Hinged items shall be provided with a brace or other means of support to hold equipment in the “out” position for maintenance it is not free to rotate and remain in the “out” position without support.
### FIG. 109 Minimum Handle Dimensions

**Braces**—Hinged items shall be provided with a brace or other means to hold equipment in the out position during checking or maintenance.  

**Access**—Sliding, rotating, or hinged equipment to which rear access is required shall be free to open or rotate their full distance and remain in the open position without

</table>
being supported by hand. If access panels are provided do not require opening more than one to remove any single unit and keep all panel removals to a minimum.

40.12 Layout—Units shall be laid out so that a minimum of place-to-place movements will be required during checkout. Position components so the heavier ones are the easiest to reach. Keep components under 13.6 kg (30 lbs) where possible, with removal items under 20.5 kg (45 lbs) max. Place the heavy units so they can be slid out rather than lifted out. Difficult to reach items shall weigh less than 11.3 kg (25 lbs) and the 20.4-kg (45-lbs) items shall be placed for two-person handling.

40.13 Covers or Panels—Removal of any replaceable item shall require opening or removing a minimum number of covers or panels.

41. Conductors

41.1 Coding—Cables containing individually insulated conductors with a common sheath shall be coded.

41.2 Cable Clamps—Long conductors, bundles, or cables, internal to equipment, shall be secured to the equipment chassis by means of clamps unless contained in wiring ducts or cable retractors.

41.3 Length—Cables shall be long enough so that each functional unit can be checked in a convenient place. Extension cables shall be provided where this is not feasible.

41.4 Cable Routing—Cable routing shall not obstruct visual or physical access to equipment for operation or maintenance.

41.5 Location of Test Cables—If it is essential that test cables terminate on control and display panels, the test receptacles shall be so located that the test cables will not interfere with controls and displays.

41.6 Access—Cables shall be routed so as to be directly accessible for inspection and repair.

41.7 Susceptibility to Abuse—Cables shall be routed or protected in such a way that they may not be pinched by doors, lids, and so forth, walked on, used for handholds, or bent or twisted sharply or repeatedly.

41.8 Cable Protection—If it is necessary to route cables and wires through holes in mental partitions, the conductors shall be protected from mechanical damage or wear by grommets or equivalent means. Where required for NBC survivability, cables shall be wrapped and sealed.

41.9 Identification—Cables shall be labeled to indicate the equipment to which they belong and the connectors with which they mate. All replaceable wires and cables shall be uniquely

FIG. 110 Desirable Upper Limits for Handwheel Torque
identified with distinct color or number codes. Color-coded wires shall be color coded over their entire length. Number codes shall be repeated every 50 cm (20 in.) over the wire’s entire length.

42. Connectors

42.1 Use of Quick-Disconnect Plugs—Plugs requiring no more than one turn, or other quick-disconnect plugs, shall be provided whenever feasible.

42.2 Keying—Plugs shall be designed so that it will be impossible to insert a wrong plug in a receptacle or to insert a plug into the correct receptacle the wrong way.

42.3 Identification—Electrical plugs and receptacles shall be identified by color, shape, labels, or equivalent means (see Fig. 111). If labels are used, they shall be placed on the connector and receptacle, on plates attached to the connector and receptacle, or on tabs or tapes attached to the connector (in that order of preference).

42.4 Alignment—Plugs or receptacles shall be provided with aligning pins or equivalent devices to aid in alignment and to preclude inserting in other than the desired position.

42.5 Aligning Pins—Aligning pins shall extend beyond the plug’s electrical pins to ensure that alignment is obtained before the electrical pins engage. All aligning pins for a given plug or series of plugs shall be oriented in the same direction, unless this conflicts with precautions against mismatching.

42.6 Orientation—Plugs and receptacles shall be arranged so that the aligning pins or equivalent devices are oriented in the same relative position.

FIG. 111 Methods of Identifying Plugs and Receptacles to Prevent Mismatching
42.7 **Coding**—Plugs and receptacles shall have durable strips, arrows, or other indications to show the positions of aligning pins or equivalent devices for proper insertion.

42.8 **Spacing**—Connectors shall be spaced far enough apart so that they can be grasped firmly for connecting and disconnecting. Space between adjacent connectors, or between a connector and any adjacent obstructions, shall be compatible with the size and shape of the plugs, and the type of clothing worn by the maintainer (for example, cold weather handwear, NBC gloves), but shall be not less than 25 mm (1 in.), except where connectors are to be sequentially removed and replaced and 25-mm (1-in.) clearance is provided in a swept area of at least 4.71 rad (270°) around each connector at the start of its removal/replacement sequence. Spacing shall be measured from the outermost portion of the connector, that is, from the backshell, strain relief clamp, dust cover, or EMI/RFI shield. Where high torque is required to tighten or loosen the connector, space shall be provided for use of a connector wrench.

42.9 **Testing and Servicing**—The rear of plug connectors shall be accessible for testing and servicing, except where precluded by potting, sealing, or other requirements.

42.10 **Drawer Modules**—Drawer modules designed for remove-and-replace maintenance shall be provided with connectors mounted on the back of the drawer and mated with connectors in the cabinet to accomplish electrical interconnection between the drawer, other equipment in the rack, and external connectors, where feasible. Guide pins or equivalent devices shall be provided to aid in alignment.

42.10.1 **Electronic Modules**—Replacement electronic items (for example, modules and high-failure-rate components) should be provided with simple plug-in, rack-and-panel-type connectors.

42.11 **Simplicity**—In electronic equipment, replacement items (for example, modules and high-failure-rate components) shall normally be provided with simple plug-in connectors.

42.12 **Disassembly and Adapters**—Disassembly of connectors for reasons of changing pin connections shall be easily performed without special tools. When adapters are required, they shall be capable of being hand-tightened.

42.13 **Dust Covers**—If dust covers are required, captive types shall be used.

43. **Electrical Wires and Cables**

43.1 **Routing**—Wherever possible, cables should be routed over, rather than under pipes or fluid containers. Route cables so that they are not pinched by doors, lids, and slides; are not walked on or used for handholds; are accessible to the technician, that is, are not under floorboards, behind panels or components that are difficult to remove, or routed through congested areas, and need not be bent or unbent sharply when connected or disconnected (Fig. 112 and Fig. 113).

43.2 **Coding**—Each cable or wire shall be labeled or coded throughout its entire length. Labels installed at a bench preparatory site shall be placed so they will be visible, and in the proper orientation to the reader, once the wire or cable is installed.

43.3 **Leads**—Enough slack shall be provided so terminal fittings can be replaced at least twice and preferably three times.

43.4 **Fan Out in Junction Boxes**—Cables shall fan out in junction boxes for easy checking, especially if there are no other test points in the circuits (see Fig. 113). Each terminal in the junction box shall be clearly labeled and easy to reach with test probes.

43.5 **Location of Junction Boxes**—Junction boxes that contain many wires (for example, IC junction boxes) which will require continued access after installation shall not be located under false decks or other difficult places to reach.

43.6 **Preformed Cables**—Use preformed cables when possible (Fig. 114). They permit flexible, more efficient assembly methods and minimize the chances of making wiring errors. They also permit testing and coding of the entire cable before installation. Once the cable is placed in position on the chassis, the leads can be connected without interference and confusion caused by stray wires.
44. Test Points

44.1 Adjustment—Test points used in adjusting a unit shall be located close to the controls and displays.

44.2 Troubleshooting—Sufficient test points shall be provided so that it will not be necessary to remove subassemblies from assemblies to accomplish troubleshooting.

44.3 Location—Test points and their associated labels and controls shall be located so they face the user in their test position.

44.4 Design Considerations—Test points shall be provided, designed, and located as follows:

44.4.1 So that there will be a minimum of disassembly or removal of other equipment or items.

44.4.2 On surfaces on or behind accesses that may be easily reached or readily operated when the equipment is fully assembled and installed.

44.4.3 So that adequate clearance is provided between connectors, probes, controls, and so forth, for easy grasping and manipulation. The following minimum clearances are recommended:

44.4.3.1 When only finger control is required, 19 mm (0.75 in.).

44.4.3.2 When the gloved hand must be used, 75 mm (3 in.).

44.4.4 With guards and shields to protect personnel and test or service equipment, particularly if the equipment must be serviced while operating.

44.4.5 To avoid locating a single test or service point in an isolated position; such points are most likely to be overlooked or neglected.

44.4.6 With windows to internal items requiring frequent visual inspections, such as gages, indicators, and so forth.

44.4.7 With tool guides and other design features to facilitate operation of test or service points that require blind operation.

44.4.8 Within easy functional reaching or seeing distance of related or corresponding controls, displays, fittings, switches, and so forth.

44.4.9 Away from dangerous electrical, mechanical, or other hazards. A hands-width separation of 115 mm (4.5 in.) shall be provided from the nearest hazard, along with guards and shields, to prevent injury.

44.5 Adjustment Controls—Where adjustment controls are associated with test and service points, they shall be designed and positioned so that:

44.5.1 They are capable of being quickly returned to the original settings to minimize realignment time if they are inadvertently moved.

44.5.2 Adjustments are independent of each other whenever possible.

44.5.3 Those that require sequential adjustment are located in the proper sequence and marked to designate the order of adjustment.

44.5.4 Knobs are used in preference to screwdriver adjustments except where inadvertent or unauthorized adjustments want to be avoided. In those cases, a screwdriver adjustment is preferred.

45. Test Equipment

45.1 Storage—Adequate storage space shall be provided within portable test equipment, its handling case, or lid to contain leads, probes, spares, manuals, and special tools, as required for operation.

45.2 Instructions—Instructions for operating portable test equipment shall be provided on the face of the test equipment, in a lid, or in a special compartment. Where applicable, the instructions shall include a reminder to calibrate the equipment before using it.

45.3 Switches—Selector switches shall be used instead of a number of plug in connections. Circuit breakers and fuses shall be used to safeguard against damage if the wrong switch or jack position is used.

45.4 Portable Test Equipment Design:

45.4.1 Rectangular or square shapes are recommended with dimensions to fit standard electrical racks if possible.

45.4.2 Stands or casters shall be provided for devices weighing more than 13.6 kg (30 lbs). Wheels, casters, or hoist-lifting shall be provided for devices weighing more than 40.8 kg (90 lbs).

45.4.3 Portable test equipment shall have rounded corners and edges.

45.4.4 Hinged, permanently attached covers are recommended.

45.4.5 The weight and dimensions of portable test equipment shall not exceed those listed in Table 45.

45.4.6 Instructions shall be written in a simple language and printed large enough to be seen in low light.

46. Failure Indications and Fuse Requirements

46.1 Indication of Equipment Failure:

<table>
<thead>
<tr>
<th>TABLE 45 Weight and Dimensions of Portable Test Equipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimensions</td>

</tr>
<tr>
<td>Width, mm (in.)</td>
</tr>
</tbody>
</table>
46.1 Power Failure—An indication shall be provided to reveal when power failure occurs. All mission-essential electronic computer and peripheral components that are part of a system shall incorporate an automatic self-check diagnostic of software and hardware at power up and at the request of the operator to assure they are functioning properly.

46.1.2 Out of Tolerance—Displays shall be provided to indicate when equipment has failed or is not operating within tolerance limits.

46.1.3 Critical Malfunctions—If equipment is not regularly monitored, an auditory alarm shall be provided to indicate critical malfunctions.

46.2 Fuses and Circuit Breakers:

46.2.1 General—When required by the system, a positive indication shall be provided to reveal that a fuse or circuit breaker has opened a circuit.

46.2.2 Replacement and Resetting—Fuses shall be readily accessible for removal and replacement. No other components shall require removal to gain access to fuses. No special tools shall be required for fuse replacement unless required by safety considerations. When resetting of circuit breakers is permissible, and is required for system operation during a mission, the breaker shall be located within reach of crew members in their normal operating posture.

46.2.3 Markings—The area of equipment served by the fuse or circuit breaker shall be identified. The current rating of fuses shall be permanently marked adjacent to the fuse holder. In addition, SPARE shall be marked adjacent to each spare fuse holder. Fuse ratings shall be indicated either in whole numbers, common fractions (such as \( \frac{1}{4} \)), or whole number and common fractions (such as \( 2\frac{1}{4} \)). Labeling of fuses and circuit breakers shall be legible in the anticipated ambient illumination range of the operator’s location.

46.2.4 Circuit Breaker Controls—Toggle bat and legend switch-actuated circuit breakers may be used to control electrical power. Push-pull-type breakers shall not be used as power switches.

46.2.5 Printed Circuit Boards—Printed circuit boards shall be designed and mounted for ease of removal and replacement, considering such factors as finger access, gripping aids, and resistance created by the mounting device. Appropriate feedback shall be provided to insulate the technician knows when the board is securely connected. Printed circuit boards shall be identified in accordance with MIL-STD-130 and reference designations for parts mounted on the printed circuit board shall be provided in accordance with MIL-STD-454, Requirement 67. These standards are applicable only to military vessels.

46.2.6 Circuit Breaker Dimensions and Separations—Dimensions and separation for toggle bat-actuated breakers shall comply with Fig. 42. Legend switch-actuated breakers shall comply with the dimension and separation criteria shown in Fig. 44. Push-pull-actuated circuit breaker separation shall comply with Fig. 47.

46.3 Other Design Considerations:

46.3.1 Fuses, or circuit breakers, shall be provided so that each unit of a system is separately fused and adequately protected from harmful powerline variations or transient voltages.

46.3.2 Fuses shall be located on the front or side panel of the unit where they can be seen and replaced without removing other parts. Fuses shall not be located inside the equipment.

46.3.3 Fuses shall be grouped in a minimum number of central, readily accessible locations and shall be replaceable by the equipment operator whenever possible, without the use of tools.

46.3.4 Cups or caps shall be the quick-disconnect, rather than the screw-in type; they shall be knurled and large enough to be removed easily by hand.

46.3.5 Fuse installations shall be designed so that only the cold terminal of the fuse can be touched by personnel.

46.3.6 When selecting fuses or circuit breakers, consider the suitability of each to perform a particular function (Table 46). There are two types of circuit breakers, thermal air and magnetic air. Thermal air circuit breakers are used primarily for overcurrent circuit protection. They are best adapted to dc circuits up to 250 V and to ac circuits up to 600 V in capacities up to 600 A. Magnetic air circuit breakers may be used to provide protection in event of overcurrent, undercurrent, reverse current, low voltage, reverse phase, and so forth.

46.4 Printed Circuit Boards—Printed circuit boards shall be designed and mounted for ease of removal and replacement, considering such factors as finger access, gripping aids, and resistance created by the mounting device. Appropriate feedback shall be provided to ensure that the technician knows when the board is securely connected.

47. Hydraulic Systems

47.1 Standardization:

47.1.1 Connectors in hydraulic systems shall be of standard design and handled with standard tools.

47.1.2 Standardize, where practical, valves and cylinders, hose assemblies, couplings, fittings, and filters.

47.1.3 Use standard hardware for mounting hydraulic components.

47.1.4 Ensure that all connectors are standardized by content of lines, and that the number of different sizes are held to a minimum. If there is a danger of mismating connectors for adjacent lines carrying different fluids, specify physically incompatible connectors for the two lines.

47.2 Identification:

<table>

TABLE 46 General Comparison Fuses and Circuit Breakers
47.2.1 Use color coding for hydraulic lines, valves, and so forth, at each end of the line.

47.2.2 Provide permanent identification and instruction markings and indicate periodic inspection and drain schedules on them.

47.2.3 Inlets, outlets, and connecting lines in hydraulic systems shall be identified at least every 460 mm (18 in.), and at both ends, to facilitate maintenance.

47.3 Drain Cocks—All drain cocks shall be closed when the handle is in the down position. Those with a high rate drainage shall be fitted to all air receivers and oil reservoirs.

47.4 Seals—Seals that are visible externally after they are installed, since costly accidents result when seals are left out during assembly or repair, are preferred. However, O-ring seals are permitted. Seals shall not protrude or extrude beyond the coupling since protruding seals are chipped and shredded by vibration or contact, and the damage spreads internally to destroy sealing power and deposit pieces in the line. For low-temperature operation, use special low-temperature materials.

47.4.1 Specify couplings that use permanent seals rather than those that must be removed and replaced when the seal wears out.

47.5 Design Considerations—Hydraulic systems design shall consider the following: (See Fig. 115.)

47.5.1 Provide mechanical stops for valve handles to prevent the valves from opening because of vibrations.
47.5.2 Self-sealing couplings shall be provided on complex hydraulic and pneumatic systems to simplify identification.
47.5.3 Consider the use of armor-covered flexible hose for hydraulic lines to facilitate replacement in the field form bulk stock.
47.5.4 Use aircraft-type safety fittings with built-in check valves in hydraulic lines to limit fluid loss in the event of a line rupture.
47.5.5 Design for automatic bleeding of hydraulic systems whenever possible.

48. Design of Equipment For Remote Handling

48.1 Characteristics of Equipment to be Handled Remotely:
48.1.1 Alignment—Self-alignment devices shall be provided for components that must be joined remotely.
48.1.2 Disconnect—Quick-disconnect devices shall be provided to reduce remote-handling difficulties.
48.1.3 Fasteners—All fasteners shall be captive and readily replaceable by remote-handling techniques.
48.1.4 Lock and Latching Mechanisms—Each lock or latching mechanism shall be operable from a single point, have a positive catch, and provide a clear visual indication of the latch position.
48.2 Feedback—Provision shall be made for transmitting information from remote work areas to the operator of the remote-handling system. Visual information shall be regarded as most critical, followed, in order, by kinesthetic, tactual, and auditory feedback.

48.3 Manipulatory:
48.3.1 Safety—Power manipulators shall be provided with positive stops to prevent accidents.
48.3.2 Characteristics—For tasks that require manipulative dexterity and load capacities of less than 10 kg (22 lbs), manipulators with the following characteristics shall be provided:
48.3.2.1 Position control (that is, zero-order control in which the operator’s control output directly determines the machine output).
48.3.2.2 Mutual force reflection between control and effector.
48.3.2.3 Seven degrees of freedom in motion and force control (that is, three for translation, three for rotation, and one for gripping).
48.3.3 Power Assist—For tasks involving gross positioning of loads heavier than 10 kg (22 lbs), electrically or hydraulically powered manipulators with rate control shall be provided (that is, the operator’s control output directly determines the rate of change of the machine output).

48.4 Viewing Equipment:
48.4.1 General—A viewing system shall be provided which gives the operator of a remote manipulator adequate information with respect to the three spatial coordinates of the workspace (that is, X, Y, and Z).
48.4.2 Direct Viewing—When permitted by shielding requirements, provision shall be made for the operator to view the work directly through shielding windows.

48.4.3 Viewing Angle—To avoid distortion, requirements shall be minimized for direct viewing of objects either near the viewing window or at line-of-sight angles at incidence greater than 105 rad (60°).

48.4.4 Indirect Viewing—Applicable viewing systems, such as closed-circuit television systems, periscopes, and microscopes, shall be provided to supplement direct viewing, where required by specific remote-handling situations.

48.4.5 Coding—Symbol or pattern coding shall be used in preference to color coding for television viewing.

48.4.6 Lettering—Letters, numbers, and important details that must be viewed by means of television shall be light whenever possible.

48.4.7 Use quick-release fastening devices on connections that require frequent disconnection. Provide self-sealing features to prevent leakage of fluid when disconnect is made.

48.4.8 Use valves with integral limit switches where practicable.

48.4.9 Use permanent or cartridge-type fasteners.

48.4.10 Provide, in case of electrical failure, a means for manually operating hydraulic systems.

48.4.11 Consider the connector recommendations shown in Fig. 114.

48.4.12 To prevent fluid spraying or draining on the technician or nearby objects when fluid lines are disconnected during maintenance, use the following design recommendations:
48.4.12.1 Provide line drains to ground or container at low-level access points.
48.4.12.2 Reposition line disconnects from sensitive components or shield the component.
48.4.12.3 Provide a high-visibility warning light at disconnect areas that are especially critical against a dark background. Glazed or reflecting surfaces shall be avoided.

48.4.13 Stereo Viewing—The two images produced by a stereoscopic periscope shall not differ more than 2% in magnification or 0.50 prism diopter in vertical imbalance. Horizontal imbalance shall be no greater than 0.50 prism diopter so as not to be fatiguing. Light transmittance of the two optical paths shall be within 10% of each other.

48.5 Illumination:

48.5.1 Reflected Light—Lighting provided in remote work areas shall be such that reflected light, as measured at the operator’s work station (in direct viewing), will conform with the requirements of this standard, or as otherwise specified by the procuring activity.

48.5.2 Threshold Viewing—Monochromatic lighting shall be provided when viewing conditions are near threshold, when high magnification powers are required, or when the operator is required to view the work at high angles of incidence through refractive materials.

49. Small Systems and Equipment

49.1 Portability and Load Carrying—Individual portions of equipment shall be designed so that, when carried, the weight of the load will be distributed through as many muscle groups as possible. Pressure shall be avoided or minimized on sensitive areas, including large blood vessels, nerves, and areas lacking muscular padding. Design of load-carrying systems
shall consider the weight and distribution of individual items to
be carried by the user. The weight of the items to be carried
varies according to the climatic zone, mission to be performed,
and occupational specialty. Load-carrying systems shall be
provided with a quick-release capability.

49.1.1 Portability:
49.1.1.1 Weight—Individual portions of equipment may
weigh up to 16 kg (35 lbs) if the load is balanced and is
distributed over many muscle groups and it is not necessary for
the individual carrying the load to maintain the pace of an
infantry movement.

49.1.1.2 Lifting Aids—When necessary, lifting aids shall be
provided to permit a second person to assist the porter in
placing the load on the body.

49.1.1.3 Configuration—The load shall be designed to per-
mit freedom of movement. The shape of the load shall be free
of sharp edges or projections that may be harmful to the porter
or snag on undergrowth. The shape and weight of the load shall
not interfere with:
   (a) The length of step.
   (b) Movements of the head.
   (c) The ability to raise and lower the load when going over
      obstacles.
   (d) The ability to see where the feet are placed when
      walking.
   (e) The ability to squat.
   (f) Regulation of body temperature.
   (g) The maintenance of normal posture.

49.1.1.4 Carrying by Two Persons—Where the load is
designed for carrying by two persons, a combination of
stretcher-type handles and shoulder support shall be used, if
feasible.

49.1.1.5 Standardization—Maximum use shall be made of
standard load-carrying systems or components.

49.1.2 Transportability by Personnel—Systems that include
a requirement for transportability by personnel shall conform
to the following provisions:

49.1.2.1 Weight—Individual portions of equipment shall be
designed to weigh as little as possible if the system is to be
manually transported by an individual on foot while maintain-
ing pace with an infantry movement.

49.1.2.2 Load Carrying—The total load carried by an indi-
vidual, including clothing, weapons, and equipment for close
combat operations shall not exceed 30 % of body weight and,
for marching, 45 % of body weight. Where personnel with fifth
percentile body weight must be accommodated, the total load
shall not exceed 24.5 kg (54 lbs).

49.1.2.3 Lifting Aids—Units shall be equipped with handles
suitable for two-handed lifting and carrying. The provisions of
38.5 shall apply.

49.2 Optical Instruments and Related Equipment:
49.2.1 General—This section pertains only to direct-view,
visual optical systems. The information is presented so that
human capabilities and limitations can be considered in the
design, engineering, operation, and maintenance of optical
equipment. Detailed instrument parameters, characteristics,
and so forth, shall be a function of governing applications and
user requirements.

49.2.2 Visual Accommodation—Any adjustment of the eyes
beyond normal functional ability shall not be required.

49.2.3 Viewing Angle—Optical instruments shall be or-
iented so that they are presented to the operator at an angle
comfortable for viewing.

49.2.4 Magnification:
49.2.4.1 General—Instrument magnification shall be suffi-
ciently high to permit performance of the required application,
such as detection, recognition, identification, laying, and so
forth.

49.2.4.2 Unstabilized, Unsupported Handheld Sights—
Because of hand tremors and body motion, magnification of
unstabilized, unsupported handheld sights shall not exceed 8
power for monoculars or binoculars.

49.2.4.3 Multiple Magnification Requirements—If more
than one magnification is required, two or more discrete
magnifications shall be provided for optimum image quality
and boresight integrity. Varifocal (zoom) systems shall be
considered for use only in systems where sighting accuracy is
relatively unimportant and it results in overall simplification.

49.2.5 Field of View—Field of view shall be compatible
with intended use and optical/mechanical design limitations.

49.2.6 Entrance Pupil—The entrance pupil shall be equal to
the product of the magnification and the exit pupil diameter
and, therefore, defined by these parameters.

49.2.7 Exit Pupil:
49.2.7.1 General—The diameter of the exit pupil shall be
consistent with intended use and size/weight limitations.

49.2.7.2 Daylight—For daylight application, the exit pupil
diameter shall not be less than 3 mm (0.12 in.).

49.2.7.3 Low-Light Levels—For maximizing performance
at twilight and lower light levels, the exit pupil shall not be less
than 7 mm (0.28 in.).

49.2.8 Eye Relief—A long eye relief (for example, 25 mm
(1 in.)), is ordinarily desirable for vehicular-mounted sights to
observe on the move and to afford some field-of-view while
wearing a protective mask. The required eye relief depends
upon the particular application, but shall be at least 15 mm (0.6
in.) to permit use by observers wearing glasses.

49.2.9 Eyepiece Adjustments:
49.2.9.1 4-Power and Less—Fixed focus eyepieces set be-
tween −0.50 and −1.00 diopter may be used for instruments
4-power and less.

49.2.9.2 Over 4-Power—Eyepiece dioptic (focusing) ad-
justments (−4 to +2 dipters required, −6 to +2 dipters
desired) shall be provided and marked in 0.5-dipter incre-
ments on all instruments over 4-power magnification.

49.2.10 Optical Quality:
49.2.10.1 Axial Resolution—Axial resolution shall be equal
to or better than 300 µrad (1 min) divided by the magnification
to provide an eye-limited instrument.

49.2.10.2 Luminous Transmission—Luminous transmission
shall be as high as possible, preferably greater than 50 %.

49.2.11 Reticles:
49.2.11.1 Line Thickness—Reticule lines shall be thin
enough so as not to obscure targets, but thick enough to be
easily seen. Reticule lines shall subtend a minimum of 600 µrad
(2 min) at the eye.
49.2.11.2 Patterns—Reticle patterns shall be as simple as possible and restricted to one main mission per reticle glass. Additional patterns shall be on separate reticle glasses if added complexity is warranted for the particular application.

49.2.11.3 Format—Line reticle shall be used in preference to reticle containing one, two, or three central spots. A small cross or very small circle shall be used in preference to a dot.

49.2.11.4 Parallax—The reticle shall be focused to the target range of primary interest to limit the parallax to an acceptable value throughout the usable range.

49.2.12 Illuminated Sights and Reticles:

49.2.12.1 Night Operations—Illuminated reticle shall be provided for sights to be used during twilight or night operations.

49.2.12.2 Color—Blue shall not be used as the color if illumination for reticle or sights.

49.2.12.3 Dimming—It shall be possible to gradually lower the luminance of a sight until it is extinguished.

49.2.12.4 Illumination Level—The illumination level of a sight (once an adjustment is made) shall remain fixed under all conditions of vibration.

49.2.12.5 Uniformity—Illuminated sights shall be evenly illuminated by means of an opal diffuser or similar device.

49.2.12.6 Reticle Lines—Reticle lines for illuminated sights shall be 150-µrad (0.5-min) visual angle or more in thickness. They shall be thin enough so as not to obscure targets, but thick enough to be easily seen. In any case, their thickness shall not exceed 600 µrad (2 min).

49.2.13 Binoculars/Bioculars:

49.2.13.1 Binocular Viewing—Where continuous use of a sight under low levels of illumination will exceed 1 min, the single optical train shall be provided with two eyepieces, if this does not lead to unacceptable light losses.

49.2.13.2 Eyepiece Separation—Binocular/biocular instruments shall have an eyepiece separation scaled from 50 to 73 mm with 1-mm interval markings.

49.2.13.3 Magnification Differences—Magnification differences of two barrels shall not exceed 2 %.

49.2.13.4 Luminous Transmission Differences—Luminous transmission differences of the two barrels shall not exceed 5 %.

49.2.13.5 Matched Oculars—To avoid size differences in the images supplied to the two eyes, hence eyestrain and headache or both, oculars shall be matched in focal length, that is, shall be matched pairs.

49.2.13.6 Weight—Weight of handheld binocular/bioculars shall not exceed 1 kg (2.2 lbs) and shall not exceed 1.5 kg (3.3 lbs).

49.2.13.7 Size and Configuration—Instrument size and configuration shall be compatible with anthropometric requirements of Section 30.

49.2.14 Eyecups and Headrests—Any optical instrument requiring steady orientation of the eyes shall be provided with a headrest or eyecups, or both.

49.2.14.1 Eyecups—Eyecups shall be provided to maintain proper eye relief, eliminate stray light, and, when required, to protect or cushion the eyes and orbital region against impact with the eyepieces. The radii of Fig. 116 defines a surface of revolution within which a satisfactory symmetrical eyepiece and cup must be designed if interferences with facial features are to be avoided. These shall be applied to cushion forms when they are compressed to the maximum.

49.2.14.2 Headrests/Browpads—A headrest or brow pad shall be used to absorb energy which would be injurious to the operator’s head.

49.2.14.3 Compatibility with Clothing and Personal Equipment—Eyecups and headrests shall be compatible with helmets, protective masks, and other clothing and personal equipment.

49.2.15 Accessories:

49.2.15.1 Filters:

(a) General—Light filters, removable from the optical path, shall be provided to reduce glare, light intensity, or protect the observer’s eyes against hazardous light levels. Provisions shall be made for filter stowage, where applicable.

---

**FIG. 116 Anatomical Limits on Axially Symmetrical Ocular Metal Part**

---

| A - SUPERCIALLY ARCH REQUIREMENT | 17 mm (1/16 in) |
| B - NASAL BONE REQUIREMENT | 22 mm (7/8 in) |
| C - GREATER ALAR CARTILAGE REQUIREMENT | 32 mm (1 1/4 in) |
| D - SEPTAL CARTILAGE REQUIREMENT | 44 mm (1 3/4 in) |

---

136
(b) Use—Use of color or neutral density filters will depend upon the application. For use in observing bright light sources, neutral filters shall be considered for reducing overall brightness without affecting contrast. The use of polarizing filters shall be considered where it is necessary to reduce glare and increase apparent contrast from sun, snow, or water.

49.2.15.2 Shutter—Shutters having closure and reopening times appropriate for each application may be provided in lieu of fixed filters to protect the observer exposed to flashes from weapon systems, lasers, or nuclear devices. Shutter for protection from the observer’s own weapon system flash, which may be actuated just before the weapon is fired, shall not disturb the lay of the weapon before closing nor unnecessarily impede the observation of the projectile flight path or resultant impact.

49.2.15.3 Positioning Aids—Level vials, scales, pointers, and other devices required for positioning the instrument shall be readily visible and protected from damage of displacement.

49.2.16 Environmental Conditions—Carry/transport cases shall be provided for instruments to be hand-carried or mounted/dismounted separately. Instruments to be used under severe environmental conditions shall be designed to take into consideration the special clothing, headgear, protective masks, or other ancillary equipment required by the operator, affecting controls, eyepieces, eyecups, headrests, and other operator interfaces.

49.2.17 Lighting—Means shall be provided for illumination of internal and external scales, level vials, and so forth, under low-light-level conditions. Continuously variable control of illumination shall be provided as required by weapon system characteristics. Illumination under low-light-level conditions shall be designed to minimize the dark adaptation of the observer. Red illumination or red filters shall be used to maintain dark adaptation.

49.2.18 Maintenance:

49.2.18.1 Modular Design—When practical, optical equipment shall be developed using modular design to provide for interchangeability of optical subassemblies.

49.2.18.2 Positioning Aids—Built-in aligning devices and other aids shall be used whenever possible for ease of positioning optical assemblies within an instrument or optical modules that have multiple applications in equipment.

49.2.18.3 Quick Release—Quick-release methods of removing optical instruments shall be used wherever practical.

49.2.18.4 Collimation—Optical instruments shall be provided with built-in collimation features to allow field adjustment.

49.2.18.5 Purging and Charging—Where periodic purging and charging of optical instruments are required, an instruction plate, indicating time interval and pressure requirements, shall be accessible. Purging and charging fittings shall be accessible for required maintenance.

49.2.18.6 Component Replacement—Internal components such as light bulbs that require frequent replacement, checkout or maintenance shall be easily accessible, removable without special tools, and replaceable without removal or disassembly or other components. Components that require frequent replacement and frequently used special tools or equipment or both shall be readily accessible. Provision shall be made for storage of such components and tools in or on the specific equipment. This particularly applies to items such as light bulbs whose failure could make the instrument inoperable.

50. Operational and Maintenance Vehicles

50.1 General—Handles, levers, pedals, knobs, and workspace dimensions shall be designed to enhance effective vehicle operation by suitably clothed and equipped users with relevant body dimensions varying between fifth and ninety-fifth percentiles (See Section 30).

50.2 Seating:

50.2.1 Dimensions and Clearances—Seating for vehicle operators shall follow the dimensions and clearances recommended in Fig. 54 and Fig. 55, and Table 47, as applicable.

50.2.2 Vertical Adjustment—If the seat’s height above the floor is variable, requirements for leg room and footrest will also vary. When the seat is adjusted higher, there will be more leg room and larger footrest angles.

50.2.3 Horizontal Adjustment—Seats shall adjust at least 150 mm (6 in.) in the fore-aft direction.

50.2.4 Back Rest—Back-rest angle shall be not more than 1920 mrad (110°) from horizontal. If only the lumbar area is supported, the backrest angle of tilt shall be 1660 to 1745 mrad (95 to 100°) for operators in an alert position.

50.2.5 Seat Pan—The seat pan shall be flat and made from a rigid material.

50.2.6 Seat Padding—Seat padding shall be kept to a minimum, but it shall be resilient enough to keep the operator’s body from contacting the seat bottom during severe vibration. Seat padding made of foam-type material shall be adequately ventilated.

50.2.7 Seat Belts—All administrative-type vehicles shall have safety seat belts. Seat belts shall be installed on other types of vehicles except when they interfere with operational requirements.

50.3 Controls:

</table>
50.3.1 **Design**—Controls shall be designed so as not to be adversely affected by distortion, shock, or vibration of the vehicle.

50.3.2 **Steering**—In case of power steering assist failure, the steering gear shall afford the operator sufficient mechanical advantage to guide the vehicle during an emergency stop or during low-speed operation (see Fig. 37 for quantitative data.)

50.3.3 **Pedals**—Foot pedals shall be designed to accept the weight of the operator’s foot without initiating control action.

50.3.4 **Control of Hazardous Operations**—The operation of switches or controls that initiate hazardous operations shall require the prior operation of a locking control.

50.4 **Operating Instructions:**

50.4.1 **Provisions of Operating Instruction**—Operating instructions shall be provided for all vehicles and vehicle equipment, except where the mode of operation will be obvious to all potential operators.

50.4.2 **Format**—Information shall be presented in the form of diagrams whenever possible.

50.4.3 **Speed Notice**—Maximum permissible road speeds in each gear and range shall be indicated. On vehicles for which all road speeds are limited by engine speed, a red line on the tachometer (if so equipped), at maximum engine RPM, may be used in lieu of a speed placard.

50.4.4 **Shift Handle Position**—Operating positions of shift handles, such as transmission, power take-off, winch-control, and transfer case mechanisms shall be illustrated.

50.4.5 **Control Movements**—Control movements shall be shown in planes parallel to the movement of the actual controls.

50.4.6 **General Labeling Criteria**—Identification and instruction markings shall conform with the criteria for labeling contained in this standard.

50.5 **Visibility:**

50.5.1 **Night Operation**—Indicators required by the vehicle operator during night operation shall be illuminated. The display luminance shall be adjustable from 0.1 to 3.5 cd/m² (0.03 to 1.0 ft-L). Blackout lighting systems, if required, shall be designed to preclude accidental operation of external lights and signals.

50.5.2 **Visual Field**—The operator shall have forward visibility through a lateral visual field of at least π rad (180° preferably 3840 mrad (220°)).

50.5.3 **Glare**—Appropriate use shall be made of visors or other means to preclude performance degradation caused by glare from external sources such as sunlight or headlights except that windshields or other transparent areas through which high-acuity vision is required shall not be tinted or colored.

50.5.4 **Windshields and Windows**—Transparent materials selected for windshield and windows shall be shatterproof and shall neither distort nor obscure vision.

50.5.5 **Windshields Wipers and Washers**—Windshield wipers and washers shall be provided. Blades shall return to the stored position when turned OFF. Provisions shall be made for manual operation in event of power failure.

50.5.6 **Forklifts**—The configuration of forklift mechanisms and forklift truck cabs shall permit the operator to have direct view of the tips of the forks in all typical modes of material loading and in all likely operator positions.

50.6 **Heating and Ventilation:**

50.6.1 **Heating**—The crew compartments shall be provided with a heating system capable of maintaining temperatures above 20°C (68°F) during occupancy when personnel are not wearing arctic clothing and exposure is for extended duration (that is, more than 3 h). When arctic clothing is worn, cab heaters shall be capable of maintaining a reference temperature of not less than 5°C (41°F) at the minimum ambient design temperature with the vehicle moving at two-thirds maximum speed and the defrosters operating at maximum capacity. The reference temperature is measured 610 mm (24 in.) above the seat reference point of each operator/passenger position. Air temperatures around any part of the operator/passenger’s body shall not vary more than ±5°C (±9°F). The heater shall achieve these requirements within 1 h after it is turned on.

50.6.2 **Ventilation**—Outside fresh air shall be supplied at minimum rate of 0.57 m³ (20 ft³)/min/person. Air flow rates for hot-climate operation (temperatures above 32°C (90°F)) shall be maintained between 4.2 and 5.7 m³ (150 and 200 ft³)/min/person, unless air conditioning or individual (microclimate) cooling is provided. Air velocity at each person’s head location shall be adjustable either continuously or with not less than three settings (OFF, LOW, and HIGH) from near zero to at least 120 m (400 ft)/min.

50.6.3 **Visibility**—The heating-ventilating system shall be designed to minimize degradation of visibility as a result of frosting or misting of the wind shield.

50.7 **Cranes, Materials, Handling, and Construction:**

50.7.1 **General**—Positioning of equipment and loads shall be facilitated through use of center-of-gravity identification, matching guidelines, identification of attaching points, detachable probes, and so forth. Latches on control levers shall not cause delay in operation.

50.7.2 **Control Labels**—All controls used with lifting equipment shall be labeled as to function and direction of movement.

50.7.3 **Control Placement**—The placement of controls shall be within easy reach of the operator and shall afford optimum visibility of the load at all times.

50.7.4 **Foot-Operated Controls**—Foot-operated controls shall not be selected for precise adjustments or movements. Foot-operated brake pedals that require locking shall lock by foot action alone. For ease of operation, the pedals shall rise from the depressed position in a backward as well as vertical movement.

50.7.5 **Load Capacity**—The load capacity shall be indicated on the equipment, and audible warning devices shall be provided where necessary to indicate that the allowable load is being exceeded.

50.7.6 **Visibility**—Maximum, unobstructed view of the work, including the point sheaves of the basic boom of a revolving crane at a 3-m (10-ft) radius shall be visible to suitably clothed and equipped users with relevant body dimensions varying between fifth and ninety-fifth percentiles.

50.7.7 **Handholds and Footholds**—Suitable handholds and footholds shall be provided to facilitate personnel access and movement.
51. Hazards and Safety

51.1 General—As a part of system equipment design, safety factors shall be given major consideration, including, as a minimum, the effective application of the human engineering criteria in other sections of this practice, together with the representative safety criteria herein.

51.1.1 Principles of Human Behavior Related to Safety—There are principles of human behavior that are of importance to the designer striving to design safe equipment. Armed with this knowledge the designer can design out many of the accidents that occur with shipboard equipment.

51.1.1.1 If the equipment is insufficient, it will be modified by the user, usually at the job site and often with built-in hazards.

51.1.1.2 The operational/maintenance procedures must be clean, definite, and comprehensive, otherwise they will be ignored.

51.1.1.3 Equipment design must be such that it encourages safe use, that is, do not provide hardware that can be used in an unsafe manner.

51.1.1.4 If the equipment or system is not designed to operate as the user’s cultural expectancies and stereotypes lead him or her to think it will operate, he or she will eventually make a mistake.

51.1.1.5 If an unsafe design is allowed in the equipment, no warning note in a technical manual can eliminate it completely. Neither can regular or even special training prevent accidents, even if it mandatory.

51.1.1.6 Equipment users tend to be unimaginative; they do not visualize the consequences of unsafe acts. Therefore, do not expect that an obviously dangerous task will be recognized by the user.

51.1.1.7 Designers shall consider the possibilities for errors and design equipment so incorrect use (deliberate or accidental) will do as little harm as possible.

51.1.1.8 People make guesses as to what a label, instruction, operational chart, and so forth, says if it is not complete, legible, and readable. Be sure that they are complete and legible.

51.1.1.9 If procedures for safe operation or maintenance seem needlessly difficult or burdensome, people avoid doing what is necessary for safety. So, make it easier to use safely than to use it unsafely.

51.1.1.10 Equipment develops a reputation among users and maintainers regarding its difficulty or hazardous use that can significantly affect the way it is used and serviced.

51.1.1.11 Abbreviated checklists tend to cause mistakes so make job procedures detailed enough so the user does not have to fill in the blanks.

51.1.1.12 People must be protected against themselves. Designers cannot create an unsafe piece of equipment or system and expect the user to look out for himself or herself.

51.1.1.13 An operator’s care in using and maintaining an item tends to increase in relation to the item’s cost and complexity. Thus, complicated and costly pieces of equipment, with safety hazards, will usually produce fewer accidents as a result of poor maintenance than will the simpler and less expensive equipment.

51.1.1.14 Ease of maintenance affects the equipment’s reliability.

51.1.1.15 Equipment is particularly susceptible to misuse if operators must communicate with each other to use it.

51.2 Safety Labels and Placards:

51.2.1 Hazard-Identifying Plates—All hazard plates (that is, danger, caution) shall comply with Section 28 and shall be mounted adjacent to any equipment that presents a hazard to personnel (from high voltage, heat, toxic vapors, explosion, ionizing radiation, and so forth) or equipment.

51.2.2 Center of Gravity and Weight—Where applicable, the center of gravity and the weight of equipment shall be distinctly marked.

51.2.3 Weight Capacity—The weight capacity shall be indicated on stands, hoists, lifts, jacks, and similar weight-bearing equipment, to prevent overloading.

51.2.4 Identification of Protective Areas—Areas of operation or maintenance in which special protective clothing, tools, or equipment are necessary (insulated shoes, gloves, suits, and so forth) shall be specifically identified.

51.2.5 NO-STEP Markings—NO-STEP markings shall be provided when necessary to prevent injury to personnel or damage to equipment.

51.2.6 Electrical Labels—All receptacles shall be marked with their voltage, phase, and frequency characteristics, as appropriate.

51.2.7 Hand Grasp Areas—Hand grasp areas shall be conspicuously and unambiguously identified on the equipment.

51.3 Pipe, Hose, and Tube Line Identification—Pipe, hose, and tube lines for liquids, gas, steam, and so forth, shall be clearly and unambiguously labeled or coded as to contents, pressure, heat, cold, or other specific hazardous properties.

51.4 General Workspace Hazards:

51.4.1 Alerting Device—A hazard-alerting device shall be provided to warn personnel of impending danger or existing hazards. Normally, a flashing red light and siren (if an auditory signal is used) are used for the worst condition (DANGER) while a horn and amber light are used for the CAUTION condition.

51.4.2 Emergency Doors and Exits—Emergency doors and exits shall be constructed so that they:

51.4.2.1 Are simple to operate,
51.4.2.2 Are directly accessible,
51.4.2.3 Are unobstructed,
51.4.2.4 Are simple to locate and operate in the dark,
51.4.2.5 Are quick opening in 3 s or less,
51.4.2.6 Require 44 to 133 N (10 to 30 lbs) of operating force to open, and
51.4.2.7 Do not themselves, or in operation, constitute a safety hazard. Two exits, doors, or kickout panel, shall be provided in any manned space where fuel, chemicals, or other flammable materials are used.

51.4.3 Stairs—Stairs, including incline, step risers, and treads, shall conform with standard safe design practice. Incline ladders shall have a maximum angle of 60°, 50° preferred. Skid-proof flooring, stair, and step treads shall be...
provided. Where conditions warrant special precaution, surfaces shall be covered with a non-slip coating. Incline ladders shall run fore and aft.

51.4.4 Obstructions—Workspace around areas where heavy manual maintenance is performed shall be free of obstructions that could cause injury to personnel, either through accidental contact with the obstruction or because the obstruction requires an awkward or dangerous body position.

51.4.4.1 Pipe Hangers—Pipe hangers shall not protrude from the overhead into the minimum head room. Hangers used to support pipe mounted on bulkheads or other locations where they can be struck by passing crew members shall be of the U type and installed, as close as possible, to that shown in Fig. 89 (lower drawing).

51.4.4.2 Storage Racks—Storage racks located in passageways for gas bottles, casualty cables, fire-fighting equipment, and so forth, shall not impede traffic flow and shall not have securing nut studs or other sharp objects protruding into the passageway.

51.4.4.3 Door Swing—Hinges for doors on lockers, electrical cabinets, storage bins, and so forth, shall be located so that a partial or fully opened door will not interfere with personnel and equipment flow.

51.5 Illumination—Adequate illumination shall be provided in all areas. Hazard-identifying plates, stairways, and all hazardous areas shall be illuminated in accordance with the recommended levels of Table 32.

51.6 Thermal Contact Hazards—Equipment that, in normal operation, exposes personnel to surface temperatures greater or less than those shown in Table 48, shall be appropriately guarded. Surface temperatures induced by climatic environment are exempt from this requirement. Cryogenic systems shall also be appropriately guarded.

51.7 General Equipment-Related Hazards:

51.7.1 Interlocks and Alarms—The operation of switches or controls that initiate hazardous operations (ignition, movement of a crane, and so forth) shall require the prior operation of a related or locking control. Where practicable, the critical position of such a control shall activate a visual and auditory warning device in the affected work area.

51.7.2 Access—Units shall be so located and mounted that access to them can be achieved without danger to personnel from electrical charge, heat, moving parts, chemical contamination, radiation, or other hazards. Mounting heights for common electrical fixtures shall be in accordance with Fig. 117.

51.7.3 Hazardous Access—Where access areas must be located over dangerous mechanical or electrical components, the access door or cover shall be designed to actuate an internal light when opened, and a highly visible warning label shall be provided on the outside of the door or cover.

51.7.4 Edge Rounding—Where applicable, all exposed edges and corners shall be rounded to a minimum of 0.76-mm (0.03-in.) radius. Sharp edges and corners that present a personal safety hazard or potential damage to equipment during usage shall be suitably protected or rounded to a minimum radius of 13 mm (0.5 in.).

51.7.5 Storeroom Shelves—Shelves in storerooms over 203 mm (80 in.) above the deck shall be equipped with foot supports (lower shelves are acceptable) designed to support a 113-kg (250-lbs) load. Where lower shelves are used as a foot support, they shall be designed to support whatever may be stored on the shelf plus a 113-kg (250-lbs) load.

51.7.6 Eyewash Fountains—A minimum clearance of 30 cm (12 in.), and 48 cm (15 in.) preferred, shall be provided on either side of an eyewash fountain as measured from the fountain centerline.

51.8 Platforms:

51.8.1 Locks—Self-locking or other fail-safe devices shall be incorporated on elevating stands, work platforms, and drawbridges to prevent accidental or inadvertent collapsing or falling.

51.8.2 Handrails, Safety Bars, and Chains—Handrails, safety bars, or chains shall be installed around platforms and across stair or step openings in platforms, ledges, catwalks, and so forth. Such guards shall be placed 107 cm (42 in.) above the standing surface. An intermediate guard rail shall be provided. Chains shall only be used where it is not feasible to install handrails or safety bars. Kickboards, at least 152 mm (6 in.) high, shall be installed. When platforms are raised and located near a railing (for example, signal lights on the bridge wings), the railing around the platform must also be raised to maintain the 107-cm (42-in.) height.

51.8.3 Safety Mesh—Screen or safety mesh shall be installed on the underside of open gratings, platforms, or flooring surfaces where there is a possibility that small tools, parts, or debris may fall through the grating on workers or equipment beneath the platform.

51.8.4 Elevated Work Platforms—Elevated work platforms raised by electric or hydraulic motors shall fail safe so that in the event power or hydraulic failure occurs the platform will lock in the up position. All platforms shall have their lifting capacity clearly marked on the platform.

51.9 Electrical Hazards:

51.9.1 Shock—The principle electrical hazard is shock. All electrical potentials of 30-V rms or more are potential shock hazards. Most shock deaths result from contacting relatively low potentials, ranging from 70 to 500 V. Table 49 summarizes typical effects of various currents.

51.9.2 Shock Prevention—One or more of the following shall be used to minimize the chance of inadvertent contact

</table>
with live electrical wires, potentials, exposed contacts, charged capocetone, and so forth.

51.9.2.1 Guards.

51.9.2.2 Grounding.

51.9.2.3 Interlock Switches—Every door or access part that provides access to high-voltage potentials shall have an interlock.

51.9.2.4 Warning Signs.

51.9.2.5 Capacitor Discharge Devices (Bleeders) shall discharge the capacitor fully in 1 min or less.

51.9.2.6 Fuses.

51.9.3 Insulation of Tools—Tools and test leads to be used near high voltages shall be adequately insulated.

51.9.4 Plugs and Receptacles—Plugs and receptacles shall be designed so that a plug of one voltage rating cannot be inserted into a receptacle of another rating.

51.9.5 Voltage Exposure—Equipment shall be designed so that all hot contacts will be socket contacts.

51.9.6 Ground Potential—Equipment shall be designed so that all external parts, with the exception of antenna and transmission line terminals, will be at ground potential.

51.9.7 Electrically Operated Hand Tools—Electrically operated hand-held power tools shall be designed with three-wire power cords with one wire at ground potential and shall have exposed surfaces that are either nonconducting or are electrically connected to the ground wire. Exposed surfaces include cases, grips, handles, switches, triggers, chucks, and other surfaces that are capable of being contacted during operation. Portable tools, protected by an approved system of double insulation or its equivalent, may be used without a ground wire when approved by the procuring activity. Hand tools with the potential for injury to personnel (for example, deck sanders, large drills, and so forth) shall be equipped with a dead man power switch.

51.9.8 Vehicle Batteries—All batteries that have a rating greater than 25 amp hours shall have terminal guarding to prevent inadvertent short-circuit. Such guarding shall also prevent short-circuiting of the battery in spite of clearly improper but possible acts by personnel, such as placing of tools across terminals, resting a heavy object on the battery cover, and standing on a battery cover.

51.9.9 Main Power Switch—Every item of equipment shall have a clearly labeled main-power switch that turns off all power to the item.

51.10 Mechanical Hazards:

51.10.1 Guards—A guard shall be provided on all moving parts of machinery and transmission equipment, including pulleys, belts, gears, blades, and so forth, on which personnel may become injured or entangled. Where perforations are provided in guards for air circulation, none shall be larger than a 13-mm (0.5-in.) round or square hole.

51.10.2 Steps and Ladders—Adequate clearance for fingers shall be provided in the design of telescoping steps or ladders.

51.11 Fluid Hazards:

51.11.1 Connectors—Each connector used in the handling or control of hazardous fluids, including propellants, solvents, toxics, hypergolics, asphyxiants, and so forth, shall be incompatible with other connectors within the access area of that conductor.

51.11.2 Fluid and Fuel-Servicing Equipment—Automatic shutoff devices shall be provided on fluid and fuel service equipment to prevent overflow and spillage.

51.11.3 Flammable Liquid Lockers—Flammable liquid lockers shall not be installed nearer than 1.8 m (6 ft) to a door or exit if it is the only means of egress from the space or compartment.

51.12 Barriers—Barriers may be used to protect a person from contacting a hazard (for example rotating machinery,
electrical contact, hot pipe). The required height of the barrier and the distance separating the barrier from the hazard depends on the height of the hazard as shown in Fig. 118.

51.13 Toxic Hazards:
51.13.1 Toxic Fumes:
51.13.1.1 General—All reasonable precautions shall be taken to eliminate toxic fume hazards. From the standpoint of practical health-hazard control, the most important constituents are carbon monoxide from gasoline engines, aldehydes, nitrogen oxides from diesel engines, and sulfur dioxide from marine turbine engines.

(a) Carbon Monoxide—Carbon monoxide in personnel areas shall be reduced to the lowest level feasible. Personnel shall not be exposed to concentrations of carbon monoxide (CO) in excess of values which will result in carboxyhemoglobin (COHb) levels in their blood greater than the following percentages: 5% COHb (all system design objectives and aviation system performance limits) and 10% COHb (all other systems performance limits).

51.13.1.2 Allowable Limits—Allowable limits for some of the toxic gases described above are shown in Table 50.

51.13.2 Toxic Material—Place all storage bins containing toxic material (for example, soaps, bleach, and so forth, in the laundry) in a vertical position if possible. If mounted horizontally, the bins shall be no higher than 151 cm (60 in.) above the deck.

There should be no interpolation of the values in the table, see the following examples:

**Example 1**

The height of the danger point, "A", is 1500 mm (59.1 in) and its horizontal distance, "C", from the proposed barrier is 700 mm (27.6 in). Using the table, the height of the barrier, "B", should be 1800 mm (71.1 in).

**Example 2**

The height of the barrier, "B", is 1300 mm (51.2 in) and the height of the danger point, "A", is 2300 mm (90.6 in). Using the table, the barrier should be positioned 600 mm (23.6 in) from the danger point.

**Example 3**

The height of the barrier, "B", is 1700 mm (66.9 in) and the horizontal distance, "C", from the danger point is 550 mm (21.7 in). Using the table, the danger point should not be between 1200 and 2200 mm (47.2 and 86.8 in).

**FIG. 118 Required Distance Between Hazard and Barrier**
51.14 Radiation—Radiation-emitting systems and equipment require special consideration to minimize hazards to operators and maintenance personnel. Ionizing radiation exposure rates produced by any device shall not exceed 0.5 mR/h at a distance of 50 mm (2 in.) from any point on the external surface.

52. User-Computer Interface

52.1 General—Computer programs and equipment interfaces shall provide a functional interface between the system for which they are designed and users (operators/maintainers) of that system. This interface shall optimize compatibility with personnel and shall minimize conditions that can degrade human performance or contribute to human error.

52.1.1 Standard Procedures—Users shall be provided standard procedures for similar, logically related transactions.

52.1.2 Computer Response—Every input by a user shall consistently produce some perceptible response output from the computer.

52.1.3 On-Line Guidance—Users shall be provided on-line data and command indices and dictionaries to guide selection and composition for data and command entries. Definitions of allowable options, system capabilities, procedures, and ranges of values shall be displayable at the user’s request.

52.1.4 System Status—Users shall be provided information at all times on system status regarding operational modes, availability, and loads, either automatically or by request.

52.1.5 Log-On Procedures—In applications in which users must log on to the system, log on shall be a separate procedure that must be completed before a user is required to select among any operational options.

52.1.5.1 Automatic Log-On Display—Appropriate prompts for log on shall be automatically displayed on the user’s terminal with no special action required other than turning on the terminal.

52.1.5.2 Log-On Feedback—Users shall be provided feedback relevant to the log-on procedure that indicates the status of the inputs.

52.1.5.3 Log-On Delay—If a user cannot log on to a system, a prompt shall be explained to provide the reason for this inability. Log-on processes shall require minimum input from the user consistent with the requirements prohibiting illegal entry.

52.1.6 Log-Off Procedures—When a user signals for log off, the system shall check pending transactions to determine if data loss seems probable. If so, the computer shall prompt for confirmation before the log-off command is executed.

52.1.7 Computer Failure—In the event of partial hardware/software failure, the program shall allow for orderly shutdown and establishment of a checkpoint so restoration can be accomplished without loss of computing performed to date.

52.1.8 Interaction—Where two or more users may access the computer program or data processing results from multiple personnel-equipment interfaces, the operation by one person shall not interfere with the operations of another person unless mission survival may be contingent upon the preemption. Provisions shall be made so that the preempted user can resume operations at the point of interference without information loss.

52.2 Data Entry:

52.2.1 General—Data entry functions shall be designed to establish consistency of data entry transactions, minimize input actions and memory load on the user, ensure compatibility of data entry with data display, and provide flexibility of user control of data entry.

52.2.2 User Pacing Manual—Data entry shall be paced by the user, depending on the user’s application, criticality of the operation and attention span, rather than by the system.

52.2.3 Positive Feedback—The system shall provide a positive feedback to the user of the acceptance or rejection of a data entry.

52.2.4 Processing Delay—Where system overload or other system conditions will result in a processing delay, the system shall acknowledge the data entry and provide an indication of the delay to the user.

52.2.5 Explicit Action—Data entry shall require an explicit completion action, such as the depression of an ENTRY key.

52.2.6 Validation—Data entries shall be validated by the system for correct format, legal value, or range of values. Where repetitive entry of data sets is required, data validation for each set shall be completed before another transaction can begin.

52.2.7 Software Available Data—The user shall not be required to enter data already available to the software.

52.2.8 Input Units—Data shall be entered in units that are familiar to the user.

52.2.9 Cursors:

52.2.9.1 Control—Systems using cursors shall provide cursor control capability consistent with user speed and accuracy requirements.

52.2.9.2 Display—A movable cursor within the display shall have a distinctive visual attribute that does not obscure other displayed entities. When fine positioning accuracy is required, as in some forms of graphic and image-processing applications, the displayed cursor shall include an appropriate point designation feature (such as crosshairs).

52.2.9.3 Home Position—The home position for the cursor shall be consistent across similar types of displays.

52.2.9.4 Explicit Actuation—A separate, explicit action, distinct from cursor position, shall be required for the actual entry (for example, enabling, actuation) of a designated position.

52.2.9.5 Consistent Positioning—Where cursor positioning is incremental by discrete steps, the step size of cursor movement shall be consistent horizontally (that is, in both right and left directions) and vertically (in both up and down directions).
52.2.9.6 Keyboard Cursor Control—When position designation is required in a task emphasizing keyed data entry, cursor control shall be by some device integral to the keyboard. If cursor movement is accomplished by depressing keys, the keys shall be located on the main keyboard.

52.2.9.7 Movement Relationships—The response of a cursor to control movements shall be consistent, predictable, and compatible with the user’s expectations. For cursor control by key action, a key labeled with a left-pointing arrow shall move the cursor leftward on the display; for cursor control by joystick, leftward movement of the control shall result in leftward movement of the cursor.

52.2.9.8 Abbreviations, Mnemonics, and Codes—When abbreviations, mnemonics, or codes are used to shorten data entry, they shall be distinctive and have a relationship or association to normal language or specific job-related terminology.

52.2.9.9 Explicit Delete Action—Data deletion or cancellation shall require an explicit action, such as the depression of a DELETE key.

52.2.9.10 Change of Data—Where a user requests change (or deletion) of a data item that is not currently being displayed, the option of displaying the old value before confirming the change shall be presented.

52.2.9.11 Single Method of Data Entry—Data entry methods and data displays shall not require the user to shift between entry methods.

52.2.9.12 Data Entry Display—Where data entry on an electronic display is permitted only in prescribed areas, a clear visual definition of the entry fields shall be provided.

52.3 Keyboard:

52.3.1 Use—A keyboard shall be used to enter alphabetic, numeric, and other special characters into the system.

52.3.2 Timely Display—Keyed inputs, except security items such as passwords, shall be echoed on the display within 0.1 s.

52.3.3 Length—Except for extended text, the length of individual data items shall be minimized.

52.3.4 Justification—When entering tabular data, the user shall not be required to right- or left-justify tabular data entries. The system shall automatically justify columnar data with respect to decimal point, left margin, and right margin.

52.3.5 Numeric Keypads—Keyboards used in systems requiring substantial numeric input shall be equipped with a numeric keypad.

52.3.6 Minimization of Keying—The amount of keying required shall be minimized by using numbered lists and abbreviations.

52.3.7 Minimization of Shift Keying—The use of key-shifting functions shall be minimized during data entry transactions.

52.3.8 Data Change—In keyed data entry, means shall be provided to allow users to change previous entries, if necessary, by DELETE and INSERT actions.

52.4 Fixed Function (Dedicated) Keys:

52.4.1 Use—Fixed function keys (for example, ENTER) shall be used for time-critical, error-critical, or frequently used control inputs.

52.4.2 Standardization—Fixed function keys shall be common throughout the system.

52.4.3 Functional Consistency—Once a key has been assigned a given function, it shall not be reassigned to a different function for a given user.

52.4.4 Availability—Fixed function keys shall be selected to control functions that are continuously available; lockout of fixed function keys shall be minimized.

52.4.5 Nonactive Keys—Nonactive fixed function keys shall be replaced by a blank key on the keyboard.

52.4.6 Grouping—Fixed function keys shall be logically grouped and shall be placed in distinctive locations on the keyboard.

52.4.7 Activation—A fixed function key shall require only a single actuation to accomplish its function.

52.4.8 Feedback—When fixed function key activation does not result in an immediately observable natural response, the user shall be given an indication of system acknowledgement.

52.4.9 Function Labels—Key assignments shall be displayed at all times, preferably through direct marking. Where abbreviations are necessary, they shall be in accordance with Section 28.

52.5 Variable Action Keys:

52.5.1 Use—Variable action keys may be used for programmable menu selection and entry of control functions.

52.5.2 Status Display—When the effect of an action key varies, the status of the key shall be displayed.

52.5.3 Reprogrammable or Inactive Default Action—When keys with labeled default functions are reprogrammed or turned off, a visual warning shall alert the user that the standard action is not currently accessible via that key.

52.5.4 Relabeling—Provision shall be made for easily relabeling variable action keys. Labels for variable function keys, located along the perimeter of a display, may be generated on the display face.

52.5.5 Shifted Characters—Variable function keys shall not be shifted character keys that require the depression of a shift key before each actuation of the variable key.

52.5.6 Easy Return to Base-Level Functions—Where the functions assigned to a set of function keys change as a result of user selection, the user shall be given an easy means to return to the initial, base-level functions. For example, in cockpit design, where multifunction keys may be used for various purposes such as navigation or weapons control, the aircrew should be able to take a single action to restore those keys quickly to their basic flight control functions.

52.5.7 Minimization of Keying—Operational sequences using variable action keys shall be minimized with respect to the number of key functions required.

52.6 Lightpen:

52.6.1 Use—A lightpen may be used when noncritical, imprecise input functions are required. Such direct-pointing controls shall be used when item selection is the primary type of data entry.

52.6.2 Dimensions and Mounting—See 26.6.3.
52.6.3 Actuation—Lightpens shall be equipped with a discrete actuating/deactuating mechanism. For most applications, a push-tip switch, requiring 0.5 N (2 to 5 oz) of force to actuate, is preferred.

52.6.4 Feedback—Two forms of feedback shall be provided to the user when using a lightpen:

52.6.4.1 Feedback concerning lightpen placement, preferably in the form of an illuminated circle projected from the lightpen onto the display screen, and

52.6.4.2 Feedback that the lightpen has actuated and the input has been received by the system.

52.7 Joystick/Trackball:

52.7.1 Use—A joystick, trackball, or similar device may be used when precise input functions are required. These devices shall conform to 26.2, 26.3, 26.4, 26.5, and 26.6.

52.7.2 Actuation/Deactuation—A discrete mechanism shall be provided to allow the user to actuate/deactuate the device.

52.8 Touch Screen—See 26.8 for information on touch screens.

53. Data Display

53.1 Display Format:

53.1.1 Consistency—Display formats shall be consistent within a system.

53.1.1.1 When appropriate for users, the same format shall be used for input and output.

53.1.1.2 Data entry formats shall match the source document formats.

53.1.1.3 Essential data, text, and formats shall be under computer, not user, control.

53.1.2 Criticality—Only data essential to the user’s needs shall be displayed.

53.1.3 Readily Usable Form—Data presented to the user shall be in a readily usable and readable form that the user does not have to transpose, compute, interpolate, or mentally translate into other units, number bases, or languages.

53.1.4 Order and Sequences—When data fields have a naturally occurring order (such as chronological), such order shall be reflected in the format organization of the fields.

53.1.4.1 Data Grouped by Importance—Where some displayed data items are of significant importance or require immediate user response, those items shall be grouped at the top of the display.

53.1.4.2 Data Grouped by Function—Where sets of data are associated with particular questions or related to particular functions, each set may be grouped together to help illustrate those functional relationships.

53.1.4.3 Data Grouped by Frequency—Where some data items are used more frequently than others, those items may be grouped at the top of the display.

53.1.5 Data Separation—Separation of groups of information shall be accomplished by blanks, spacing, lines, color coding, or other means consistent with the application.

53.1.6 Recurring Data Fields—Recurring data fields within a system shall have consistent names and shall have consistent relative position within displays.

53.1.7 Extended Alphanumeric—When five or more alphanumeric characters within natural organization are displayed, the characters shall be grouped in blocks of three to five characters within each group separated by a minimum of one blank space or other separating character such as a hyphen or slash.

53.1.8 Comparative Data Fields—Data fields to be compared on a character-by-character basis shall be positioned one above the other.

53.1.9 Labels and Titles—Each display shall be labeled with a title or label that is unique within the system. To make the display as meaningful as possible and to reduce user memory requirements, every field or column heading shall be labeled.

53.1.9.1 Display Title—Every display shall begin with a title or header at the top, describing briefly the contents or purpose of the display. There shall be at least one blank line between the title and the body of the display.

53.1.9.2 Command Entry, Prompts, Messages at Bottom—The last several lines at the bottom of every display shall be reserved for status and error messages, prompts, and command entry.

53.1.10 Data Group Labels—Each individual data group or message shall contain a descriptive title, phrase, word, or similar device to designate the content of the group or message. Labels shall perform the following:

53.1.10.1 Be located in a consistent fashion adjacent to the data group or message they describe. The relationship of the label to the group, field, or message being described shall be unambiguous.

53.1.10.2 Be highlighted or otherwise accentuated to facilitate operator scanning and recognition. The technique used to accentuate labels shall be different from, and easily distinguished from, that used to highlight or code emergency or critical messages.

53.1.10.3 Be unique and meaningful to distinguish them from data, error messages, or other alphanumericcs.

53.1.10.4 Be displayed in uppercase only, while text may be displayed in uppercase and lowercase.

53.1.10.5 Reflect the question or decision being posed to the user, when presenting a list of user options.

53.1.11 Scrolling—Items continued on the next page (scrolled) shall be numbered relative to the last item on the previous page.

53.1.12 Page Numbering—Each page of a multiple-page display shall be labeled to identify the currently displayed page and the total number of pages, for example, Page 2 of 5.

53.1.13 Frame Identification—Every display frame shall have a unique identification to provide a reference for use in requesting the display of that frame. The frame identification shall be an alphanumeric code or an abbreviation which is prominently displayed in a consistent location. It shall be short enough (three to seven characters) and meaningful enough to be learned and remembered easily.

53.2 Display Content:

53.2.1 Standardization—The content of displays within a system shall be presented in a consistent, standardized manner.

53.2.2 Information Density—Information density shall be held to a minimum in displays used for critical task sequences. A minimum of one-character space shall be left blank vertically
above and below critical information, with a minimum of
two-character spaces left blank horizontally before and after.

53.2.2.1 *Crowded Displays*—When a display contains too
much data for presentation in a single frame, the data shall be
partitioned into separately displayable pages.

53.2.2.2 *Related Data on Same Page*—When partitioning
displays into multiple pages, functionally related data items
shall be displayed together on one page.

53.2.2.3 *Page Labeling*—In a multipage display, each page
shall be labeled to show its relation to the others.

53.2.3 *Abbreviations and Acronyms*—Information shall be
displayed in plain concise text wherever possible. Abbrevia-
tions and acronyms shall conform to Section 28. Abbreviations
shall be distinctive to avoid confusion. Words shall have only
one consistent abbreviation. No punctuation shall be used in
abbreviations. Definitions of all abbreviations, mnemonics, and
codes shall be provided at the user’s request.

53.2.3.1 *Data Entry and Display Consistency*—Data dis-
play word choice, format, and style shall be consistent with the
requirements for data entry and control.

53.2.3.2 *Context for Displayed Data*—The user shall not
have to rely on memory to interpret new data; each data display
shall provide needed context, including recapitulating prior
data from prior displays as necessary.

53.3 *Display Coding*:

53.3.1 *Use*—Coding shall be used to differentiate between
items of information and to call the user’s attention to changes
in the state of the system. Coding shall be used for critical
information, unusual values, changed items, items to be
changed, high priority messages, special areas of the display,
errors in entry, criticality of command entry, and targets.
Consistent, meaningful codes shall be used. Coding shall not
reduce legibility or increase transmission time.

53.3.2 *Flash*—Flash coding shall be used to call the user’s
attention to mission critical events only. No more than two
flash rates shall be used. Where one rate is used, the rate shall
be between three and five flashes per second. Where two rates
are used, the second rate shall be less than two per second.

53.3.3 *Brightness*—Brightness intensity coding shall be
used only to differentiate between an item of information and
adjacent information. No more than three levels of brightness
shall be used. Each level shall be separated from the nearest by
at least a 2:1 ratio.

53.3.4 *Pattern and Location*—Pattern and location coding
shall be used to reduce user search time by restricting the area
to be searched to prescribed segments.

53.3.5 *Underlining*—Underlining may be used to indicate
unusual values, errors in entry, changed items, or items to be
changed.

53.3.6 *Symbol*—Symbol coding may be used to enhance
information assimilation from data displays. Symbols shall be
analogous of the event or system element they represent or be in
general use and well known to the expected users. Where size
difference between symbols is used, the major dimensions of
the larger shall be at least 150% of the major dimension of the
smaller with a maximum of three size levels permitted.

53.3.6.1 *Special Symbols*—When special symbols are used
to signal critical conditions, they shall be used for only that
purpose.

53.3.6.2 *Markers Close to Words Marked*—When a special
symbol is used to mark a word, the symbol shall be separated
from the beginning of the word by one space.

53.3.7 *Color*—Color coding may be used to differentiate
between classes of information in complex, dense, or critical
displays. Information shall not be coded solely by color if the
data must be accessed from monochromatic as well as color
terminals or printed in hardcopy versions.

53.3.8 *Shape*—Shape coding may be used for search and
identification tasks.

53.3.9 *Brightness Inversion*—When a capability for bright-
ness inversion is available (so-called “reverse video,” where
dark characters on a bright background can be changed under
computer control to bright on dark or vice versa), it may be
used for highlighting critical items that require user attention.
When used for alerting purposes, brightness inversion shall be
reserved consistently for that purpose and not be used for
general highlighting.

53.4 *Dynamic Displays*:

53.4.1 *Changing Values*—Changing alphanumeric values
that the operator must reliably read shall not be updated more
than once per second. Changing values that the viewer uses to
identify rate of change or to read gross values shall not be
updated faster than five times per second, nor slower than
twice second, when the display is to be considered as real time.

53.4.2 *Update Rate*—The rate of update shall be control-
able by the user and shall be determined by the use to be made
of the information.

53.4.3 *Display Freeze*—A display freeze mode shall be
provided to allow close scrutiny of any selected frame that is
updated or advanced automatically by the system. For frozen
display frames, an option shall be provided to allow resump-
tion at the point of stoppage or at the current real-time point.

53.4.4 *Freeze Feedback*—An appropriate label shall be
provided to remind the operator when the display is in the
freeze mode.

53.5 *Tabular Data*:

53.5.1 *Use*—Tabular data displays shall be used to present
row-column data.

53.5.2 *Standard Formats*—Location of recurring data shall
be similar among all tabular data displayed and common
throughout the system.

53.5.3 *Arrangement*—Tabular data shall be displayed in a
left-to-right, top-to-bottom array. Alphanumeric data shall be
left justified; numeric data shall be right justified with decimal
points, if any, aligned vertically.

53.5.4 *Titles*—When tabular data are divided into classifi-
cations, the classification titles shall be displayed and subclassi-
fication shall be identified. When tabular data extend over
more than one page vertically, the columns shall be titled
identically on each page.

53.5.5 *Horizontal Extension*—Tabular displays shall not
extend over more than one page horizontally.
53.5.6 Lists—Items in lists shall be arranged in a recognizable order, such as chronological, alphabetical, sequential, functional, or importance.

53.5.6.1 List Lines—Each item in a list shall start on a new line.

53.5.6.2 Vertical Extension—Where lists extend over more than one display page, the last line of one page shall be the first line of the succeeding page.

53.5.6.3 Marking Multiline Items in a List—Where a single item in a two separate word list continues for more than one line, such items shall be marked in some way (for example, blank line, indentation) so that the continuation of the item is obvious.

53.5.6.4 Arabic Numerals—When listed items will be numbered, Arabic numerals shall be used rather than Roman.

53.5.6.5 Vertical Ordering in Multiple Columns—Where items in a list are displayed in multiple columns, items shall be ordered vertically within each column.

53.5.6.6 Hierarchic Structure for Long Lists—Where lists are long and must extend beyond more than one displayed page, a hierarchic structure shall be used to permit the logical partitioning into related shorter lists.

53.5.7 Numeric Punctuation—Long numeric fields shall not be punctuated with spaces, commas, or slashes. Conventional punctuation schemes shall be used if in common usage. Where none exist, a space shall be used after every third or fourth digit. Leading zeros shall not be used in numerical data except where needed for clarity.

53.5.8 Alphanumeric Grouping—Strings of alphanumericics shall be grouped into sets of three to five characters or grouped at natural breaks. When a code consists of both letters and digits, common character types shall be grouped for ease of location.

53.5.9 Distinctive and Informative Labels—Rows and columns shall be labeled distinctively to guide data entry.

53.5.10 Justification of Numeric Entry—Users shall be allowed to make numeric entries in tables without concern for justification; the computer shall right justify integers or else justify with respect to a decimal point if present.

53.5.11 Labeling Units of Measurement—In tabular display, the units of displayed data shall be consistently included in the column labels.

53.5.12 Consistent Column Spacing—Column spacing within a table from one table to another shall be uniform and consistent.

53.5.13 Column Scanning Cues—A column separation of at least three spaces shall be maintained.

53.5.14 Row Scanning Cues—In dense tables with many rows, a blank line shall be inserted after a group of rows at regular intervals. No more than five lines shall be displayed without a blank line being inserted.

53.6 Graphic Displays:

53.6.1 Use—Graphic data displays may be used to present assessment of trend information, spatially structured data, time critical information, or relatively imprecise information.

53.6.2 Recurring Data—See 53.1.6.
target areas on maps, flight plans), templates or skeletal displays shall be provided for those formats to aid data entry.

53.6.16 Computer Deviation of Graphic Data—When graphic data can be derived from data already available in the computer, machine aids for that purpose shall be provided.

53.6.17 Drawing Lines—When line drawing is required, users shall be provided with aids for drawing straight line segments. When line segments must join or intersect, computer aids shall be provided to aid in such connection.

53.6.18 Drawing Figures—When a user must draw figures, computer aids shall be provided for that purpose (for example, templates, tracing techniques, stored forms).

53.6.19 Changing Size—When editing graphic data, users shall be provided with the capability to change the size (scale) of any selected element on the display, rather than delete and recreate the element in a different size.

53.6.20 Highlighting Critical Data—When a user’s attention must be directed to a portion of a graphic display showing critical or abnormal data, that feature shall be highlighted with some distinctive means of data coding.

53.6.21 Reference Index—When a user must compare graphic data to some significant level or critical value, a reference index or baseline shall be included in the display.

53.6.22 Data Annotation—When precise reading of a graphic display may be required, the capability shall be provided to supplement the graphic representation with the actual numeric values.

53.6.23 Normal Orientation for Labels—The labels on dynamic graphic displays shall remain with the top of the label up when the displayed image rotates.

53.6.24 Pictorial Symbols—Pictorial symbols (for example, icons, pictograms) shall look like the objects, features, or processes they represent.

53.6.25 Display of Scale—When a map or other graphic display has been expanded from its normal presentation, an indicator of the scale expansion shall be provided.

53.6.26 Consistent Scaling—When users must compare graphic data across a series of charts, the same scale shall be used for each chart.

53.6.27 Single Scale Only—Where graphs are presented, only a single scale shall be shown in each axis, rather than including different scales for different curves in the graph. If interpolation must be made or where accuracy of reading graphic data is required, computer aids shall be provided the user.

53.6.28 Unobtrusive Grids—When grid lines are displayed, they shall be unobtrusive and shall not obscure data elements. Grid lines shall be displayed or suppressed at the option of the user.

53.6.29 Direct Display of Differences—Where users must evaluate the difference between two sets of data, that difference shall be plotted directly as a curve in its own right, rather than requiring user to compare visually the curves that represent the original data sets.

53.6.30 Bar Graphs—Bar graphs shall be used for comparing a single measure across a set of several entities or for a variable sampled at discrete intervals.

53.6.30.1 Bar Spacing—Adjacent bars shall be spaced closely enough, normally not more than one bar width, so that a direct visual comparison can be made without eye movement.

53.6.30.2 Histograms (Step Charts)—Histograms (bar graphs without spaces between the bars) shall be used where bar graphs are required and where a great many intervals must be plotted.

53.7 Textual Data Displays:

53.7.1 Use—Information, such as abstracts or reports, that cannot be presented in any other format, may be presented in text format.

53.7.2 Formats—Textual data formats shall conform to the practices established for the particular type of textual data displayed.

53.7.3 Paragraph Separation—Text paragraphs shall be separated by at least one blank line. Paragraphs shall be numbered.

53.7.4 Brevity—Short simple sentences shall be used and shall be displayed in normal upper/lowercase font.

53.7.5 Abbreviations—See 52.2.9.8.

54. Text/Program Editing

54.1 Buffer—When inserting characters, words, or phrases (editing), items to be inserted shall be collected in a buffer area and displayed in the prescribed insert area of the screen for subsequent insertion by user command.

54.2 Presentation Mode—Display mode rather than line mode shall be used for text editing.

54.3 Display Window—ROLL and SCROLL commands shall refer to the display window not the text/data, that is, the display window shall appear to the user to be an aperture moving over stationary text.

54.4 Editing Commands—Easy-to-use, special editing commands, such as MOVE, COPY, and DELETE, for adding, inserting, or deleting text/program segments shall be provided.

54.4.1 Text Edit Commands—In text editing, the special commands shall be based on sentences, paragraphs, or higher-order segments.

54.4.2 Program Edit Commands—In program editing, the special commands shall be used on lines or subprograms. Program lines shall reflect a numbering scheme for ease in editing and error correction. When available, line-by-line syntax checking shall be under user control.

54.4.3 Tab Controls—For editing programs or tabular data, cursor tab controls or other provisions for establishing and moving readily from field to field shall be provided.

54.5 Editing Commands—Where editing commands are made by keying onto the display, the editing commands shall be readily distinguishable from the displayed textual material.

54.6 Highlighted Text—Where text has been specified to become the subject of control entries (for example, for underlining, bolding, moving, copying, or deleting), the affected segment of text shall be highlighted to indicate its boundaries.

54.7 String Search—The capability shall be provided to allow the user to specify a string of text (words, phases, or numbers) and request the computer to advance (or back up) the cursor automatically to the next occurrence of that string.
54.8 Automatic Line Break—An automatic line break (carriage return) shall be provided when the text reaches the right margin for entry/editing of unformatted text. User override shall be provided.

54.9 Format Control—An easy means shall be provided for users to specify required format control features during text entry/editing, for example, to specify margins, tab settings, line spacing, and so forth.

54.10 Predefined Formats—When text formats must follow predefined standards, the required format shall be provided automatically. Where text formats are a user option, a convenient means shall be provided to allow the user to specify and store for future use the formats that have been generated for particular applications.

54.11 Frequently Used Text—The capability shall be provided to label and store frequently used text segments (for example, signature blocks, organizational names, call signs, coordinates) and later to recall (copy into current text) stored segments identified by their assigned labels.

54.12 Text Displayed as Printed—Users shall have the option of displaying text as it will be printed, including underlining, boldface, subscript, superscript, special characters, special symbols, and different styles and sizes of type. Where display of all possible features (for example, special fonts) is impractical, format codes shall be highlighted and displayed within the text to mark the text that will be affected by the code.

54.13 Control Annotations—Where special formatting features are indicated in the text by use of special codes or annotation, the insertion of the special annotation shall not disturb the spacing of the displayed text and shall not disturb formatting of graphs and tables or alignment of rows and columns.

54.14 Flexible Printing Options—In printing text, users shall be allowed to select among available output formats (for example, line spacing, character size, margin size, heading, and footing) and to specify the pages of a document to be printed.

54.15 Head and Foot of File—The means shall be provided to readily move the cursor to the head or the foot (end) of the file.

55. Audio Displays, Interface

55.1 Uses—Audio displays (signals), used as part of the user-computer interface, have application where:

55.1.1 The common mode of visual display is restricted by overburdening or user mobility needs and it is desirable to cue, alert, or warn the user, or

55.1.2 The user shall be provided feedback after control actuation, data entry, or completion of timing cycles and sequences.

55.2 Other Requirements—Other audio design criteria apply. See Sections 14, 15.1 and 15.3.

55.3 Supportive Function, Audio—Audio signals used in conjunction with visual displays shall be supplementary to the visual signals and shall be used to alert and direct the user’s attention to the appropriate visual display.

55.4 Signal Characteristics—The intensity, duration, and source location of the signal shall be compatible with the acoustical environment of the intended receiver as well as the requirements of other personnel in the signal area. Signals shall be intermittent, allowing the user sufficient time to respond. Signals shall be automatically terminated by operator response action or by manual control.

55.5 Frequency—See Section 16.

55.6 Alarm Settings—When alarm signals are established on the basis of user-defined logic, users shall be permitted to obtain status information concerning current alarm settings, in terms of dimensions (variables) covered and values (categories) established as critical. Alarm status information is particularly necessary in monitoring situations in which responsibility may be shifted from one user to another as in changes of shift.

56. Interactive Control

56.1 General—System response times shall be consistent with operational requirements. Required user response times shall be compatible with required system response time. Required user response times shall be within the limits imposed by total user tasking expected in the operational environment.

56.2 Response Time—System response times shall be consistent with operational requirements. Required user response times shall be compatible with required system response time. Required user response times shall be within the limits imposed by total user tasking expected in the operational environment. See Section 56.27, Error Management/Data Protection.

56.2.1 Response Time Induced Keyboard Lockout—If computer processing time requires delay of concurrent user inputs and no keyboard buffer is available, keyboard lockout shall occur until the computer can accept the next transaction. An alert shall be displayed to indicate to the user that lockout has occurred.

56.2.2 Keyboard Restoration—When the computer is ready to continue, following response time-induced keyboard lockout, a signal to so indicate shall be presented, for example, cursor changes back to normal shape.

56.2.3 Interrupt to End Keyboard Lockout—When keyboard lockout has occurred, the user shall be provided with a capability to abort a transaction that has resulted in an extended lockout. Such capability shall act like an UNDO command that stops ongoing processing and does not RESET the computer thereby losing prior processing.

56.3 Simplicity—Control/display relationships shall be straightforward and explicit. Control actions shall be simple and direct.

56.4 Accidental Actuation—Provision shall be made to prevent accidental actuation of potentially destructive control actions, including the possibility of accidental erasure or memory dump.

56.5 Compatibility with User Skill—Controls shall be compatible with the lowest anticipated user skill levels.

56.6 Availability of Information—Information necessary to select or enter a specific control action shall be available to the user when selection of that control action is appropriate.

56.7 Concurrent Display—Control actions to be selected from a discrete set of alternatives shall have those alternatives displayed before the time of selection. The current value of any
parameter or variable with which the user is interacting shall be displayed. User control inputs shall result in a positive feedback response displayed to indicate performance of requested actions.

56.8 Hierarchical Process—When hierarchical levels are used to control a process or sequence, the number of levels shall be minimized. Display and input formats shall be similar within levels and the system shall indicate the current positions within the sequence at all times.

56.9 User Memorization—The requirement to learn mnemonics, codes, special or long sequences, or special instructions shall be minimized.

56.10 Dialogue Type—The choice of dialogue type (for example, form filling, menus, command language) for interactive control shall be compatible with user characteristics and task requirements.

56.11 Number System—When numeric data is displayed or required for control input, such data shall be in the decimal, rather than binary, octal, hexadecimal, or other number system.

56.12 Data Manipulation—The user shall be able to manipulate data without concern for internal storage and retrieval mechanisms of the system.

56.13 Computer-Processing Constraints—The sequence of transaction selection shall generally be dictated by user choices and not by internal computer-processing constraints.

56.14 Feedback for Correct Input—Control feedback responses to correct user input shall consist of changes in state or value of those elements of the displays that are being controlled in an expected and logically natural form. An acknowledgement message shall be used only in those cases in which the more conventional mechanism is not appropriate or feedback response time must exceed 1 s.

56.15 Feedback for Erroneous Input—Where control input errors are detected by the system, error messages shall be available, and error recovery procedures shall be provided.

56.16 Control Input Data Display—The presence and location of control input data entered by the user shall be clearly and appropriately indicated. Data displayed shall not mislead the user with regard to nomenclature, units of measure, sequence of task steps, or time phasing.

56.17 Originator Identification—Except for broadcast communication systems, the transmitter of each message in inter-user communications shall be identified—automatically, if possible.

56.18 Menu Selection:

56.18.1 Use—Menu selection interactive control shall be used for tasks that involve little or no entry of arbitrary data and where users may have relatively little training. It shall also be used when a command set is so large that users are not likely to be able to commit all of the commands to memory.

56.18.2 Selection Devices—Lightpens or other pointing devices shall be used for menu selection. Where design constraints do not permit pointing devices, a standard window shall be provided for the user to key the selected option code.

56.18.3 Titles—Each page of options (menu) shall have a title that clarifies the purpose of that menu.

56.18.4 Series Entry—Users shall be provided the capability to stack menu selections, that is, to make several menu selections without having each menu displayed.

56.18.5 Sequences—A menu shall not consist of a long list of multipage options, but shall be logically segmented to allow several sequential selections among a few alternatives.

56.18.6 Active Option Presentation—The system shall present only menu selections for actions that are currently available.

56.18.7 Format Consistency—Menus shall be presented in a consistent format throughout the system and shall be readily available at all times.

56.18.8 Option Sequence—Menu selections shall be listed in a logical order, or, if no logical order exists, in the order of frequency of use.

56.18.9 Simple Menus—When the number of selections can fit on one page in two columns, a simple menu shall be used. If the selection options exceed two columns, hierarchical menus may be used.

56.18.10 Option Presentation—Selection codes and associated descriptors shall be presented on single lines.

56.18.11 Direct Function Call—If several levels of hierarchical menus are provided, a direct function call capability shall be provided such that the experienced user does not have to step through multiple menu levels.

56.18.12 Consistency With Command Language—When menu selection is used to train in the use of a command language, the wording and order shall be consistent with the command language.

56.18.13 Option Coding—When selections are indicated by coded entry, the code associated with each option shall be included on the display in some consistent manner.

56.18.14 Keyed Codes—If menu selections must be made by keyed codes, the options shall be coded by the first several letters of their displayed labels rather than by more arbitrary numeric codes.

56.18.15 Position in Structure—When menu traversal can be accomplished by clearly defined hierarchical paths, the user shall be given some indication of the displayed menu’s current position in the overall or relevant structure, such as by having an optional display of “path” information. A menu tree showing the menu hierarchy shall be included in the user manual.

56.18.16 Back Menu—When using hierarchical menus, the user shall be able to return to the next higher level by using single key action until the initial, top-level menu or display is reached.

56.18.17 Return to Top Level—A function shall be provided to directly recall the initial, top-level menu or display without stepping through the menu or display hierarchy.

56.19 Form Filling:

56.19.1 Use—Form-filling interactive control may be used when some flexibility in data to be entered is needed and where the users will have moderate training.

56.19.2 Grouping—Displayed forms shall be arranged such that related items are grouped together.

56.19.3 Format and Content Consistency—The format and content of displayed forms shall be perceptually related to that
of paper forms, if paper forms are used to guide data entry. A standard input form shall be used.

56.19.4 Distinctiveness of Fields—Fields or groups of fields shall be separated by lines or other delineation cues. Required fields shall be distinguished from optional fields.

56.19.5 Field Labels—Field labels shall be distinctively presented such that they can be distinguished from data entry. Labels for data entry fields shall incorporate additional cueing of data format where the entry is made up of multiple inputs, for example, DATE (M/D/Y): __/__/__.

56.19.6 Cursor—A displayed cursor shall be positioned by the system at the first data entry field when the form is displayed. The cursor shall be advanced by a tab key to the next data entry field when the user has completed entry of the current field.

56.19.7 Entry Length Indication—The maximum acceptable length for variable length fields shall be indicated.

56.19.8 Overwriting—Data entry by overwriting a set of characters in a field (such as a default) shall not be used.

56.19.9 Unused Underscores—When an item length is variable, the user shall not have to remove unused underscores.

56.19.10 Dimensional Units—When a consistent dimensional unit is used in a given entry field, the dimensional unit shall be provided by the computer. When the dimensional unit varies for a given field, it shall be provided, or selected, by the user.

56.19.11 User Omissions—When required data entries have not been input, the omission shall be indicated to the user and either immediate or delayed input of the missing items shall be allowed. For delayed entry, the user shall be required to enter a special symbol in the field to indicate that the missing item is delayed, not overlooked.

56.19.12 Nonentry Areas—Nonentry (protected) areas of the display shall be designated and made inaccessible to the user via the cursor.

56.19.13 Flexible Data Entry—When multiple data items are entered as a single transaction, the user shall be allowed to reenter, change, or cancel any item before taking a final ENTER action.

56.19.14 Information Labels—Descriptive wording shall be used when labeling data fields; use of arbitrary codes shall be avoided.

56.19.15 Logical Order—Where no source document or external information is involved, forms shall be designed so that data items are ordered in a logical sequence for input.

56.19.16 Form Filling for Control Entry—Form filling shall be considered as an aid for composing complex control entries. For example, for a print request, a displayed form might help the user invoke the various format controls that are available.

56.19.17 Fixed Function Keys—Fixed function key interactive control may be used for tasks requiring only a limited number of control inputs or in conjunction with other dialogue types.

56.20 Command Language:

56.20.1 Use—Command language interactive control may be used for tasks involving a wide range of user inputs and where user familiarity with the system can take advantage of the flexibility and speed of the control technique.

56.20.2 User Viewpoint—A command language shall reflect the user’s point of view such that the commands are logically related to the user’s conception of what is being done.

56.20.3 Distinctiveness—Commands shall be distinctive from one another.

56.20.4 Punctuation—The command language shall contain a minimum of punctuation or other special characters.

56.20.5 Abbreviations—The user shall be permitted to enter the full command name or an abbreviation for any command of more than five characters.

56.20.6 Standardization—All commands and their abbreviations, if any, shall be standardized and consistent with Section 28.

56.20.7 Displayed Location—Commands shall be entered and displayed in a standard location on the display.

56.20.8 Command Prompts—The user shall be able to request prompts, as necessary, to determine required parameters in a command entry.

56.20.9 Complexity—The command language shall be programmed in layers of complexity such that the basic layer will allow the inexperienced user to control a transaction. As this person’s skill increases, the command language shall allow skipping from basic to more advanced layers to meet the user’s current needs.

56.20.10 User Definition of Macro Commands—The programming shall not accept a user designated macro name that is the same as an existing command name.

56.20.11 Standard Techniques for Command Editing—Users shall be allowed to edit erroneous command entries with the same techniques that are used to edit data entries since consistent editing techniques will speed learning and reduce errors.

56.20.12 Destructive Commands—Where a command entry may have disruptive consequences, the user shall be required to review and confirm a displayed interpretation of the command before it is executed.

56.21 Questions and Answers:

56.21.1 Use—Question-and-answer dialogues shall be considered for routine data entry tasks in which data items are known and their ordering can be constrained, users will have little or no training, and the computer is expected to have medium response speed.

56.21.2 Questions Displayed Separately—Each question shall be displayed separately in question-and-answer dialogues; users shall not be required to answer several questions at once.

56.21.3 Recapitulating Prior Answers—When a series of computer-posed questions are interrelated, answers to previous questions shall be displayed when those will provide context to help a user answer the current questions.

56.21.4 Source Document Capability—When questions prompt entry of data from a source document, the question sequence shall match the data sequence in the source document.

56.22 Query Language:
56.22.1 **Use**—Query language dialogue shall be used for tasks emphasizing unpredictable information retrieval (as in many analysis and planning tasks), with moderately trained users.

56.22.2 **Natural Organization of Data**—Query languages shall reflect a data structure or organization perceived by users to be natural. For example, if a user supposes that all data about a particular topic are stored in one place, then the query language shall permit such data to be retrieved by a single query, even though actual computer storage might carry the various data in different files.

56.22.3 **Coherent Representation of Data Organization**—A single representation of the data organization for use in query formulation shall be established, for example, if different queries will access different databases over different routes, the user shall not necessarily need to know this.

56.22.4 **Task-Oriented Wording**—The wording of a query shall simply specify what data are requested; a user shall not have to tell the computer how to find the data.

56.22.5 **Logic to Link Queries**—The query language shall be designed to include logic elements that permit users to link (for example, “and,” “or”) sequential queries as a single entry.

56.22.6 **Confirming Large-Scale Retrieval**—If a query will result in a large-scale data retrieval, the user shall be required to confirm the transaction or else take further action to narrow the query before processing.

56.23 **Graphic Interaction:**

56.23.1 **Use**—Graphic interaction as a dialogue may be considered for use by casual users to provide graphic aids as a supplement to other types of interactive control.

56.23.2 **Iconic Menus**—When system users have different linguistic backgrounds, graphic menus may be used which display icons to represent the control options.

56.23.3 **Supplementary Verbal Labels**—Where icons are used to represent control actions in menus, verbal labels shall be displayed with each icon to help assure that its intended meaning will be understood.

56.24 **Feedback:**

56.24.1 **Use**—Feedback shall be provided which presents status information, confirmation, and verification throughout the interaction.

56.24.2 **Standby**—When system functioning requires the user to standby, WORKING, BUSY, or WAIT messages shall be displayed until user interaction is again possible. Where the delay is likely to exceed 15 s, the user shall be informed. For delays exceeding 60 s, a countdown display shall show delay time remaining. (See 56.27).

56.24.3 **Process Outcome**—When a control process or sequence is completed or aborted by the system, positive indication shall be presented to the user concerning the outcome of the process and the requirements for subsequent user action.

56.24.4 **Input Confirmation**—Confirmation shall not cause displayed data removal.

56.24.5 **Current Modes**—When multiple modes of operation exist, a means shall be provided to remind the user of the current mode.

56.24.6 **Highlighted Option Selected**—When a displayed message or datum is selected as an option or input to the system, the subject item shall be highlighted to indicate acknowledgment by the system.

56.24.7 **User Input Rejection**—If the system rejects a user input, feedback shall be provided to indicate the reason for rejection and the required corrective action. Feedback shall be self-explanatory.

56.24.8 **Feedback Message Content**—Users shall not be required to translate feedback messages by use of reference system or code sheets. Abbreviations shall not be used unless necessary.

56.24.9 **Time-Consuming Processes**—The system shall give warning information when a command is invoked which will be time-consuming or expensive to process.

56.25 **Prompts:**

56.25.1 **Use**—Prompts and help instructions shall be used to explain commands, error messages, system capabilities, display formats, procedures, and sequences and to provide data. Prompting shall conform to the following:

56.25.1.1 When operating in special modes, the system shall display the mode designation and file(s) being processed.

56.25.1.2 Before processing any user requests that would result in extensive or final changes to existing data, the system shall require user confirmation.

56.25.1.3 When missing data are detected, the system shall prompt the user.

56.25.1.4 When data entries or changes will be nullified by an abort action, the user shall be requested to confirm the abort.

56.25.1.5 Neither humor nor admonishment shall be used in structuring messages; the dialog shall be strictly factual and informative for the user.

56.25.1.6 Error messages shall appear as close as possible to the user entry that caused the message.

56.25.1.7 If a user repeats an entry error, the second error message shall be revised to include a noticeable change so that the user may be certain that the computer has processed the attempted correction.

56.25.2 **Standard Display**—Prompting messages shall be displayed in a standardized area of the displays.

56.25.3 **Explicit Prompts**—Prompts and help instructions for system-controlled dialogue shall be explicit, and the user shall not be required to memorize lengthy sequences or refer to secondary written procedural references.

56.25.4 **Prompt Clarity**—Prompts shall be clear and understandable. They shall not require reference to coding schemes or conventions which may be unfamiliar to occasional users.

56.25.5 **Definitions**—A dictionary of abbreviations and codes shall be available on-line. Definitions of allowable options and ranges of values shall be displayable at the user’s request.

56.25.6 **Consistent Terminology**—On-line documentation, off-line documentation, and help instructions shall use consistent terminology.

56.25.7 **User Confirmation**—User acceptance of stored data or defaults shall be possible by a single confirming keystroke.

56.26 **Default:**
56.26.1 **Workload Reduction**—Default values shall be used to reduce user workload. Currently defined default values shall be displayed automatically in their appropriate data fields with the initiation of a data entry transaction and the user shall indicate acceptance of the default.

56.26.2 **User Selection**—The user shall have the option of generating default values based on operational experience if the systems designer cannot predefine appropriate values.

56.26.3 **Default Substitution**—The user shall be able to replace any default value during a given transaction without changing the default definition.

56.26.4 **Defaults for Sequential Entries**—Where a series of default values have been defined for a data entry sequence, the user shall be allowed to default all entries or to default until the next required entry. The experienced user may not wish to accept each default value for each data field individually.

56.27 **Error Management/Data Protection**:

56.27.1 **Error Correction**—Where users are required to make entries into a system, an easy means shall be provided for correcting erroneous entries. The system shall permit correction of individual errors without requiring reentry of correctly entered commands or data elements.

56.27.2 **Early Detection**—A capability shall be provided to facilitate detection and correction of errors after keying in but before entering into the system. While it is desirable that errors be detected early, error checking shall occur at logical data entry breaks, for example, at the end of data fields rather than character by character to avoid disrupting the user.

56.27.3 **Internal Software Checks**—User errors shall be minimized by use of internal software checks of user entries for validity of item, sequence of entry, completeness of entry, and range of value.

56.27.4 **Critical Entries**—The system shall require the user to acknowledge critical entries before their being implemented by the system. An explicitly labeled CONFIRM function key, different from the ENTER key, shall be provided for user confirmation of control and data entries that have been questioned by the computer.

56.27.5 **Error Message Content**—Error message shall be constructive and neutral in tone, avoiding phrases that suggest a judgment of the user’s behavior. The error messages shall reflect the user’s view, not that of the programmer. Error messages shall be appropriate to the user’s level of training, be as specific as possible to the user’s particular application, and describe a way to remedy, recover, or escape from the error situation.

56.27.6 **Error Recovery and Process Change**—The user shall be able to stop the control process at any point in a sequence as a result of indicated error or as an option. The user shall be able to return easily to previous levels in multistep processes to nullify an error or to effect a desired change.

56.27.7 **Diagnostic Information**—Error messages shall explicitly provide as much diagnostic information and remedial direction as can be inferred reliably from the error condition. Where clear inference is not possible, probable helpful inference(s) may be offered.

56.27.8 **Correction Entry and Confirmation**—When the user enters correction of an error, such corrections shall be implemented by an explicit action by the user (for example, actuation of an ENTER key.) All error corrections by the user shall be acknowledged by the systems either by indicating a correct entry has been made or by another error message.

56.27.9 **Spelling Errors**—Spelling and other common errors shall not produce valid system commands or initiate transactions different from those intended. When possible, the system shall recognize common misspellings of commands and execute the commands as if spelling had been correct. Computer-corrected commands, values, and spellings shall be displayed and highlighted for user confirmation.

56.27.10 **Errors in Stacked Commands**—To prompt for corrections of an error in stacked commands, the system shall display the stacked sequence with the error highlighted. Where possible, a procedure shall be provided to correct the error and salvage the stack.

56.27.11 **Display of Errorneous Entries**—A computer-detected error, as well as the error message, shall be continuously displayed until the error is corrected.

56.27.12 **Help**—In addition to explicit error management aids, (labels, prompts, advisory messages) and implicit aids (cuing), users shall be able to obtain further on-line guidance by requesting HELP. Following the output of a simple error message, users shall be permitted to request a more detailed discussion at levels of increasing detail.

56.27.12.1 **Standard Action to Request HELP**—A simple, standard action that is always available shall be provided to request HELP.

56.27.12.2 **Multilevel HELP**—When an initial HELP display provides only summary information, more detailed explanations shall be provided in response to repeated user requests for HELP.

56.27.12.3 **Browsing HELP**—Users shall be permitted to browse through on-line HELP displays, just as they would through a printed manual, to gain familiarity with system functions and operating procedures.

56.27.13 **Data Security**—Data shall be protected from unauthorized use, potential loss from equipment failure, and user errors.

56.27.13.1 **Automated Security Measures**—Automated measures shall be provided to minimize data loss from intruders in a system or from errors by legitimate users.

56.27.13.2 **Warning of Threats to Security**—Computer logic shall be provided that will generate messages or alarm signals or both to warn users of attempted intrusion by unauthorized users.

56.27.13.3 **Segregating Real from Simulated Data**—When simulated data and system functions are provided (perhaps for user training), real data shall be protected and real system use shall be clearly distinguished from all simulated operations.

56.27.13.4 **Display of Simulated Data**—In applications in which either real or simulated data can be displayed, a clear indication of simulated data shall be included as part of the classification label.

56.27.13.5 **Displayed Security Classification**—When displayed data are classified for security purposes, a prominent indication of security classification level shall be labeled in each display.
56.27.13.6 User Identification—User identification procedures shall be as simple as possible, consistent with adequate data protection. For protection of the password, the password shall not be echoed on the display. Audio feedback, rather than visual, shall be provided when imputing secure passwords during log on.

56.27.13.7 Choice of Passwords—When passwords are required, users shall be allowed to choose their own passwords since a password chosen by a user will generally be easier for that individual to remember. Guidelines for password selection shall be given so that users will not choose easily guessable ones.

56.27.13.8 Changing Passwords—Users shall be allowed to change passwords whenever they choose; all passwords shall be changed at periodic intervals.

56.28 System Response Time—Maximum system response times for real-time systems (for example, fire-control systems, command and control systems) shall not exceed the values of Table 51. Non-real-time systems may permit relaxed response times. If computer response time will exceed 15 s, the user shall be given a message indicating that the system is responding.

56.29 Other Requirements:

56.29.1 Overlays—Mechanical overlays, such as coverings over the keyboard or transparent sheet placed on the display, shall be avoided.

56.29.2 Hard Copy—The user shall have the capability to obtain a paper copy of the exact contents of the alphanumeric or digital graphic display in those systems where:

56.29.2.1 Mass storage is restricted.
56.29.2.2 Mass stored data can be lost by power interruption or
56.29.2.3 Record keeping is required.

56.29.3 Display Print—The user shall be able to print a display by simple request (for example, PRINT-SCREEN) without having to take a series of other actions first, such as calling for the display to be filed, specifying a filename, then calling for a print of that named file.

56.29.4 Print Page—The user shall have the capability to request printing of a single page, or sequence of pages, by specifying the page numbers.

56.29.5 Functional Integration—Data transmission functions shall be integrated with other information-handling functions within a system. A user shall be able to transmit data using the same computer system and procedures used for general entry, display, and other processing of data.

56.29.6 Consistent Procedures—Procedures for preparing, sending, and receiving data and messages shall be consistent from one transaction to another and consistent with procedures for other information-handling tasks.

56.29.7 Minimal Memory Load on Users—The data transmission procedures shall minimize memory load on the users by providing computer aids for automatic insertion of standard information, such as headers and distribution lists.

56.29.8 Interrupt—Users shall be allowed to interrupt message preparation, review, or disposition and then resume any of those tasks from the point of interruption.

56.29.9 Stored Message Forms—Where formats conform to a defined standard or are predictable in other ways, prestored forms shall be provided to aid users in message preparation.

56.29.10 Incorporate Existing Files—Users shall be allowed to incorporate an existing data file in a message or to combine several files into a single message for transmission and to combine stored data with new data when preparing messages for transmission. It shall not be necessary to reenter any data already entered for other purposes.

56.29.11 Addresses:

56.29.11.1 Prompting Address Entry—When users must specify the address for messages, prompting shall be provided to guide the user in the process.

56.29.11.2 Address Directory—Users shall be provided with an on-line directory showing all acceptable forms of message addressing for each destination in the system and for links to external systems.

56.29.11.3 Aids for Director Search—Computer aids shall be provided so that a user can search an address directory by specifying a complete or partial name. It shall also be possible to extract selected addresses from a directory for direct insertion into a header to specify the destination(s) for a message.

56.30 Software:

56.30.1 General—The design of computer program shall provide adequate information and respond within required time
limits with sufficient detail and precision to ensure mission accomplishment while minimizing physical and mental stress on the users.

56.30.2 Information and System Response—The information displayed to the user, such as symbols, display codes, prompts, alerts, and alarms shall be limited to that which is necessary to perform specific actions or to make decisions.

56.30.3 Computer Failure—In the event of computer failure, the program shall allow for orderly shutdown and establishment of a checkpoint so restoration can be accomplished without loss of computing performed to date.

56.30.4 Task Complexity—Software shall minimize user task complexity. Control inputs shall be simplified to the extent possible, particularly for tasks requiring real-time responses, and shall permit logical task sequences with a minimum number of control manipulations to achieve task completion.

56.30.5 Interaction—Where two or more users must have simultaneous read access to the computer program or data-processing results from multiple personnel-equipment interfaces, the operation by one person shall not interfere with the operations of another person unless mission survival may be contingent upon the preemption. Provisions shall be made so that the preempted user can resume operations at the point of interference without information loss.
Standard Specification for
Fuel Oil Meters of the Volumetric Positive Displacement Type

This standard is issued under the fixed designation F 1172; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides the minimum requirements for the design, fabrication, pressure rating, marking, and testing for fuel oil meters (volumetric positive displacement type).

1.2 The values stated in inch-pound units are to be regarded as the standard. Metric (SI) units are provided for information only.

1.3 The following safety hazards caveat pertains only to the test method section of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
F 722 Specification for Welded Joints for Shipboard Piping Systems

2.2 ANSI Standards:
B2.1 Pipe Threads
B16.1 Cast Iron Pipe Flanges and Flanged Fittings
B16.3 Malleable-Iron Screwed Fittings
B16.4 Cast-Iron Screwed Fittings
B16.5 Pipe Flanges and Flanged Fittings
B16.11 Forged Steel Fittings Socket-Welding and Threaded
B16.34 Valves, Flanged and Buttwelding End
B31.1 Power Piping

2.3 Manufacturers’ Standardization Society of the Valve and Fittings Industry.
MSS SP-25 Standard Marking System for Valves, Fittings, Flanges and Unions

2.4 API Standard:
Code No. 1101 Measurement of Petroleum Liquid Hydrocarbons by Positive Displacement Meter

2.5 American Society of Mechanical Engineers:
ASME Boiler and Pressure Vessel Code, Section VIII, Div. I, Pressure Vessels; Section IX, Welding and Brazing Qualifications

3. Terminology

3.1 Definitions of Terms Specific to This Standard:
3.1.1 fuel oil meter (volumetric positive displacement type)—device intended to indicate the volume of liquid fuel oil delivered to a fuel distribution system over a period of time.
3.1.2 maximum allowable working pressure (MAWP)—maximum system pressure to which a fuel oil meter may be subjected.

4. Ordering Information

4.1 Orders for products under this specification shall include the following applicable information:
4.1.1 Title, number, and date of this specification.
4.1.2 Operating pressure (psi) and temperature (°F).
4.1.3 End connection and size.
4.1.4 Maximum capacity required.
4.1.5 Type of fuel service.
4.1.6 Materials—external and internal.
4.1.7 Other test requirements.
4.1.8 Qualification test reports as required.

5. Materials and Manufacture

5.1 Fuel oil meter casings, as well as any pressure-retaining parts, shall be constructed of ferrous material as listed in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code. All other parts shall be constructed of materials suitable for the service intended. Fasteners in contact with interior fluid shall be of corrosion-resistant steel.

5.2 Seals and associated parts shall be of materials suitable for the service and the fluid to be measured.

---

1 This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.
4 Available from Manufacturer’s Standardization Society of the Valve and Fittings Industry, 1815 N. Fort Myer Dr., Arlington, VA 22209.

5 Available from American Petroleum Institute, 1801 K St., N.W., Washington, DC 20226.
6 Available from American Society of Mechanical Engineers (ASME), ASME International Headquarters, Three Park Ave., New York, NY 10016-5990.
5.3 Manufacture:
5.3.1 Fuel oil meters with end fittings in compliance with ANSI Standards B2.1, B16.1, B16.3, B16.4, B16.5, B16.11, or B16.34 as appropriate may be used within the pressure-temperature ranges permitted by the applicable standard provided the meter housing is satisfactory for these conditions.
5.3.2 Threaded fittings above two nominal pipe size (NPS) and socket welded flanges above 3 NPS shall not be used in fuel oil meters with a MAWP above 150 psig (1 N/mm²) and for service above 150°F (65°C).
5.4 Welding procedure qualification, welder performance qualification, and welding materials shall be in accordance with ANSI B31.1 and Section IX of the ASME Code. Brazing or soldering shall not be used.

6. Other Requirements
6.1 Components:
6.1.1 The meter shall consist of a housing with measuring mechanism and a register with counter mechanism.
6.1.1.1 Measuring Chamber—The measuring chamber for all meters shall be so constructed as not to show distortion under maximum allowable working pressure in any manner, or to affect the sensitivity of the meter.
6.1.1.2 Adjusting Device—The meter shall be provided with an adjusting device for changing the registered quantity to attain desired calibration. The adjustment setting shall have provisions for locking and shall not change during the meter life except by manual readjustment. The adjusting device shall be noncyclical and shall permit adjustment without disassembly of the mechanism except for removal of adjusting device cover plate. The plate shall be sealed by means of a lead seal. The meter shall be capable of calibration adjustment over a minimum range of 5 %.
6.1.1.3 Direction Marking of Meter—Directions for positive and negative adjustment shall be permanently marked on the meter.
6.1.1.4 Register—The register shall be of the direct-reading type. The register shall have a nonsetback total indicator and a setback-type run indicator, so that individual runs can be registered without affecting the total of all runs, as shown on the total indicator. The total indicator shall have a minimum of eight figures, and the setback run indicator shall have a minimum of five figures. Reset digits shall have a minimum height of ½ in. (13 mm) and shall not be coated with fluorescent paint. The indicating register shall read in U.S. gallons of 231 in.³ (3.785 41 × 10⁻³ m³) each. The register shall be isolated from the fluid.
6.1.1.5 Register Face—The register shall have a transparent, colorless plastic face of such size that all digits shall be easily read. Glass shall not be used.
6.2 Rating, Design, and Fabrication:
6.2.1 The maximum allowable working pressure-temperature rating (MAWP) for fuel oil meters conforming to this standard shall be established by at least one of the following methods:
6.2.1.1 Proof test in accordance with the requirements prescribed in Paragraph UG-101 of Section VIII of the ASME Code. If burst-type tests as outlined in Paragraph UG-101(m) are used, it is not necessary to rupture the component. In this case, the value of B to be used in determining the MAWP shall be the maximum pressure to which the component was subjected without rupture. Components that have been subjected to a hydrostatic proof test shall not be offered for sale.
6.2.1.2 The water temperature shall not exceed 125°F (52°C) during the test.
6.2.2 Design calculations are in accordance with the requirements prescribed in Section VIII, Division I of the ASME Code.
6.3 Where welded construction is used for the fabrication of pressure containing parts, welded joint design details shall be in accordance with Section VIII, Division 1 of the ASME Code and Specification F 722. Except for fillet welds, all welds shall be full penetration welds extending through the entire thickness of the shell.
6.4 Inlet and outlet connections consisting of welded flanges and fittings shall be in accordance with Specification F 722. When radiography is required (see 10.2), all welds shall be butt welds for Class I piping as required by Specification F 722, except packing cylinders, drains, and similar ancillary connections may be attached by fillet or socket welds.
6.5 Capacity—The maximum capacity of the meter shall be as specified by the manufacturer.
6.6 Pressure Drop—The maximum pressure drop between the meter inlet and outlet shall not exceed 5 psi (34 MPa) as certified by testing in accordance with 8.1.1.2.
6.7 Error, Normal Flow—For flow rate and calibration setting between 5 and 100 % of maximum capacity, the error of the meter shall not exceed 0.1 % for any one predetermined flow rate and accuracy setting.
6.8 Maintainability—The meter shall be so designed as not to require special tools for overhaul and repair.

7. Workmanship, Finish, and Appearance
7.1 Meter shall have all burrs or sharp edges removed and shall be cleaned of all loose metal chips and other foreign substances.
7.2 Treatment and Painting—The exterior surface of the meter shall be treated and painted in accordance with best commercial practice.

8. Number of Tests
8.1 Qualification Tests:
8.1.1 A representative fuel oil meter of each particular design shall be certified as having undergone the following qualification tests.
8.1.1.1 Calibration and adjustment:
The meter shall be tested in accordance with applicable sections of API Code 1101.
8.1.1.2 Pressure drop—Clean fluid at 35 Saybolt seconds Universal (SSU) shall be pumped through the meter at 100 % of manufacturer’s rated capacity. After the flow rate has been stabilized, the measured pressure drop between the inlet and outlet of the meter shall not exceed 5 psi (34 MPa).
8.2 Production Tests:
8.2.1 The manufacturer shall production test each fuel oil meter by hydrostatic test methods as described in Section 9.
8.2.2 Each meter shall be calibration tested at mid range of flow capacity. The reading error shall not exceed 0.1 % at this flow rate.

9. Test Methods

9.1 Hydrostatic Test—Each fuel oil meter shall be given a hydrostatic shell test of at least 1½ times its maximum allowable working pressure.

9.1.1 The fluid temperature shall not exceed 125°F (52°C) during the hydrostatic test, and the fluid used should be nonflammable. Further, it should not cause rusting and should otherwise be compatible with the internal parts of the fuel oil meter.

9.1.2 The test arrangement shall be air free before pressurization.

9.1.3 The minimum duration of the shell test shall be 30 s at required pressure.

9.1.4 No visible leakage or structural damage shall show during the test.

10. Inspection

10.1 Each finished fuel oil meter shall be visually examined and dimensionally checked to ensure that the meter corresponds to this specification and is marked in accordance with Section 12.

10.2 Nondestructive Examination of Welds:
10.2.1 All welds shall be visually examined in accordance with ANSI B31.1.

10.2.2 Welded inlet and outlet connections that are equal to or greater than 4 NPS or greater than 0.375-in. nominal wall thickness which are in services greater than 150 psig (1 N/mm²) and 150°F (65°C) shall be 100 % radiographically examined.

11. Certification

11.1 The pressure ratings established under this specification are based upon materials of high quality produced under regular control of chemical and physical properties by a recognized process. The manufacturer shall be prepared to certify that his product has been so produced and that the physical and chemical properties thereof, as proven by test specimens and nondestructive testing or as documented by certifications from the producer or recognized distributor of these materials, are at least equal to the requirements of the appropriate specifications.

11.2 When specified in the purchase order or contract, the manufacturer certification shall be furnished to the purchaser stating that samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

11.3 Certification of the MAWP shall be available to purchasers.

12. Product Marking

12.1 Each fuel oil meter shall be permanently marked with the following:

12.1.1 Manufacturer’s name or trademark.

12.1.2 Maximum allowable working pressure—temperature rating (MAWP).

12.1.3 Flow Direction—The direction of flow through the meter shall be indicated by the words “inlet” and “outlet,” a directional arrow, or both, stamped or embossed on the meter.

12.1.4 End fittings complying with a standard listed in 5.3.1 may be marked in accordance with the applicable requirements of MSS SP-25 for dimensional identification purposes if desired.

12.1.5 Size (end connection size), may be included at the option of the manufacturer.

12.1.6 ASTM designation of this specification.

13.1 The manufacturer of the fuel oil meter shall maintain the quality of the meters that are designed, tested, and marked in accordance with this specification. At no time shall a meter be sold that is marked with this standard designation that does not meet the requirements herein.

Standard Specification for Thermosetting Resin Fiberglass Pipe Systems to Be Used for Marine Applications

This standard is issued under the fixed designation F 1173; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers reinforced thermosetting resin pipe systems with nominal pipe sizes (NPS) 1 through 48 in. (25 through 1200 mm) which are to be used for all fluids approved by the authority having jurisdiction in marine piping systems.

1.2 Values stated in inch-pound are to be regarded as the standard. Values given in parentheses are for information only.

1.3 The dimensionless designator NPS has been substituted for traditional terms as “nominal diameter,” “size,” and “nominal size.”

1.4 The following safety hazards caveat pertains to the test methods which are included in this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology
3.1 Definitions are in accordance with Terminologies D 883 and F 412.
3.2 Definitions of Terms Specific to This Standard:
3.2.1 continuously electrically conductive, adv—pipe and fittings made conductive using discretely conductive materials or layers.
3.2.2 homogeneously electrically conductive, adv—pipe and fittings made conductive using a resin additive so that conductivity is maintained between any two points on the pipe or fitting.
3.2.2.1 Discussion—For conveying nonconducting fluids (those having conductance less than 1000 pico-Siemens per metre), pipe systems which are continuously or homogeneously conductive or have conductivity from the inside surface to the outside surface are recommended. In accordance with IMO Resolution A.753(18), all pipe located in a hazard—ous area, regardless of the fluid being conveyed, must be electrically conductive.
3.2.3 maximum operating pressure, n—the highest pressure that can exist in a system or subsystem under normal operating conditions.
3.2.4 representative piping system, n—a system composed of a single manufacturer’s pipes, fittings, joints, and adhesives that would normally be used by a customer or installer.

4. Classification
4.1 General—Pipe and fittings are to be classified using the following system which is similar to that of Classification D 2310 for pipe.
4.1.1 Types:
4.1.1.1 Type I—Filament wound.
4.1.1.2 Type II—Centrifugally cast.
4.1.1.3 Type III—Molded (fittings only).
4.1.2 Resin:
4.1.2.1 Resin 1—Epoxy resin.
4.1.2.2 Resin 2—Vinylester resin.
4.1.2.3 Resin 3—Polyester resin.
4.1.2.4 Resin 4—Phenolic resin.
4.1.2.5 Resin 5—Customer-specified resin.
4.1.3 Class:
4.1.3.1 Class A—No liner.
4.1.3.2 Class B—Reinforced liner.
4.1.3.3 Class C—Nonreinforced liner.
4.2 Pressure Rating—Pipe and fittings shall be classified as to the method used to obtain their pressure rating (refer to Appendix X1).

4.2.1 Rating Method 1—Short-term test.
4.2.2 Rating Method 2—Medium-term (1000-h) test.
4.2.3 Rating Method 3—Long-term (10 000-h) test.
4.2.4 Rating Method 4—Long-term (10 000-h) regression test.

4.3 Fire Endurance—Piping systems are to be classified in accordance with the following cells if fire performance is to be specified (refer to Appendix X2).
4.3.1 Fluid:
4.3.1.1 Fluid E—Empty.
4.3.1.2 Fluid EF—Initially empty for 5 min, followed by flowing water. Fluid velocity of 3-ft/s maximum during qualification test.)
4.3.1.3 Fluid S—Stagnant water.
4.3.2 Fire Type:
4.3.2.1 Fire Type JF—Jet fire with heat flux between 95 100 and 126 800 Btu/(h-ft²) (300 and 400 kW/m²).
4.3.2.2 Fire Type IF—Impinging flame with heat flux of 36 011 Btu/(h-ft²) (113.6 kW/m²).
4.3.2.3 Fire Type HF—Hydrocarbon furnace test at 1102°F (1110°C).

4.3.3 Integrity/Duration:
4.3.3.1 Integrity A—No leakage during or after fire test.
4.3.3.2 Integrity B—No leakage during fire test, except a slight weeping is acceptable. Capable of maintaining rated pressure for a minimum of 15 min with a leakage rate of 0.05 gal/min (0.2 L/min) after cooling.
4.3.3.3 Integrity C—Minimal or no leakage (0.13 gal/min (0.5 L/min)) during fire test. Capable of maintaining rated pressure with a customer-specified leakage rate after cooling.
4.3.3.4 Duration—The duration of the test shall be specified in minutes and shall be specified or approved by the authority having jurisdiction.

5. Ordering Information
5.1 When ordering pipe and fittings under this specification, the following should be specified (where applicable):
5.1.1 Service Conditions:
5.1.1.1 Fluid being transported.
5.1.1.2 Design temperature (reference 6.6).
5.1.1.3 Internal design pressure.
5.1.1.4 External design pressure.
5.1.2 General Information:
5.1.2.1 Type (reference 4.1.1).
5.1.2.2 Resin (reference 4.1.2).
5.1.2.3 Class (reference 4.1.3).
5.1.3 Pressure Rating Method (Internal Only) (reference 4.2).
5.1.4 Fire Endurance:
5.1.4.1 Fluid (reference 4.3.1).
5.1.4.2 Fire type (reference 4.3.2).
5.1.4.3 Integrity (reference 4.3.3).
5.1.4.4 Flame spread rating (reference 6.4).
5.1.4.5 Smoke and other toxic products of combustion (reference 6.5).
5.1.5 NPS.
5.1.6 Manufacturer’s Identification (part number, product name, and so forth).
5.1.7 Specific job requirements (that is, potable water usage, electrical conductivity).

6. Performance Requirements

6.1 Internal Pressure—All components included in the piping system shall have pressure ratings suitable for the intended service. Pressure ratings shall be determined in accordance with Appendix X1 using the method specified by the customer or a longer-term method, if available. If, for example, a Rating Method 2—medium-term test is specified and data for Rating Method 3—long-term test is available, then the long-term test data is acceptable. Note that for some components, particularly specialty fittings, long-term testing is not practical and ratings for these items will typically be determined using Rating Test Method 1.

6.2 External Pressure—All pipe included in the piping system shall have external pressure ratings suitable for the intended service. External pressure ratings shall be determined by dividing the results of Test Method D 2924 by a minimum safety factor of 3.

6.3 Fire Endurance—The piping system shall have the fire endurance required by the authority having jurisdiction based on the intended location and service. Fire endurance shall be determined using the appropriate method in Appendix X2.

6.4 Flame Spread—The authority having jurisdiction shall designate any flame spread requirements based on the location of the piping. For ships, mobile offshore drilling units (MODU’s), and floating oil production platforms subject to the requirements of SOLAS or Title 46 of the U.S. Code of Federal Regulations, performance shall be determined by test procedures given in IMO Resolution MSC.61(67), Annex 1, Part 5—Test for Surface Flammability, as modified for pipes in Appendix 3 of IMO Resolution A.753(18).

6.5 Smoke and Other Toxic Products of Combustion—The authority having jurisdiction shall designate any smoke and toxicity requirements based on the location of the piping. For ships, MODUs, and floating oil production platforms subject to the requirements of SOLAS or Title 46 of the U.S. Code of Federal Regulations, performance shall be determined by test procedures given in IMO Resolution MSC.61(67), Annex 1, Part 2—Smoke and Toxicity Test, as modified in B.9.0 of Appendix B—Fire Performance Tests.

6.6 Temperature—The maximum working temperature shall be at least 36°F (20°C) less than the minimum glass transition temperature (determined in accordance with Test Method D 5028 or equivalent) or heat distortion temperature (determined in accordance with ISO 75 Method A, or equivalent) of the resin or plastic material. The minimum glass transition temperature or heat distortion temperature, whichever is less, shall not be less than 176°F (80°C).

Note 1—Glass transition temperature shall be used for in-process quality control testing (reference 9.1.4, 9.2.4, and 9.3.3).

6.7 Material Compatibility—The piping material shall be chemically compatible with the fluid being carried and any fluid in which it will be immersed.

6.8 Electrical Resistance—Conductive piping systems shall have a resistance per unit length not to exceed $3.05 \times 10^3 \Omega/ft$ ($1 \times 10^3 \Omega/m$) when tested in accordance with Appendix X3. Resistance to earth at any location on an installed piping system required to be conductive shall be no greater than $1 \times 10^6 \Omega$.

6.9 Static Charge Shielding—Conductive piping systems shall have a maximum resulting voltage not to exceed 1% of the supply voltage induced on the exterior surface of the pipe when tested in accordance with Appendix X3.

6.10 Potable Water Usage—The material, including pipe, fittings, adhesive, and any elastomeric gaskets required shall have no adverse effect on the health of personnel when used for potable water service. Material shall conform to National Sanitation Standard 61 or meet the requirements of FDA Regulations 21 CFR 175.105 and 21 CFR 177.2280, 21 CFR 177.2410, or 21 CFR 177.2420.

7. Other Requirements

7.1 Flanges—Standard flanges shall have bolt patterns in accordance with ANSI B16.5 Class 150 for nominal pipe sizes 24-in. and smaller and in accordance with ANSI B16.1 Class 125 for larger flanges. Consult the manufacturer’s literature for bolt length, torque specifications, and tightening sequence.

7.2 Military Usage—Piping and fittings used in military applications shall comply with the provisions of Appendix D, Supplementary Requirements to Specification F 1173 for U.S. Navy use.

8. Workmanship and Appearance

8.1 All pipe, fittings, and spools shall be visually inspected for compliance with the requirements stated in Table 1, and, if appropriate, either repaired or rejected. After all minor repairs, a pressure test in accordance with 9.1.1, 9.2.1, or 9.3.1 shall be performed on the component.

9. Inspection and Sampling

9.1 Pipe:

9.1.1 Pressure Tests—A minimum of 5% of pipe joints shall be tested at a pressure of not less than 1.5 times the pipe system pressure rating.

9.1.2 Lot Size—A lot of pipe shall consist of 150 joints, or fractions thereof, of one size, wall thickness, and grade in continuous production.

9.1.3 Short-Term Burst Tests—Short-term hydrostatic burst tests shall be conducted in accordance with Test Method D 1599 at a minimum frequency of one test per lot. If the measured value is less than 85% of the published value, the lot is rejected or subject to retest.

9.1.4 Degree of Cure—The glass transition temperature ($T_g$) shall be determined at a minimum frequency of one test per production lot. If the measured value is more than 10°F less than the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.1.5 Glass Content—The glass content (mass fraction expressed as percentage) of at least one sample per production lot shall be determined in accordance with Test Method D 2584. If the measured glass content is not within 5% of the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.1.6 Wall Thickness—Total wall thickness and reinforced wall thickness shall be determined in accordance with Practice
TABLE 1 Visual Acceptance Criteria

<table>
<thead>
<tr>
<th>Defect Type</th>
<th>Description</th>
<th>Acceptance Criteria</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Burn</td>
<td>thermal decomposition indicated by distortion or discoloration of the laminate surface</td>
<td>none permitted</td>
<td>reject</td>

The tolerance on total and reinforced wall thickness for fittings shall refer to the manufacturer’s designated location on the body of the fitting.

9.2.4 Degree of Cure—The Tg shall be determined at a minimum frequency of one test per production lot. If the measured value is more than 10°F less than the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.2.5 Glass Content—The glass content (mass fraction expressed as percentage) of at least one sample per production lot shall be determined in accordance with Test Method D 2584. If the measured glass content is not within 5% of the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.2.6 Wall Thickness—Total wall thickness and reinforced wall thickness shall be determined in accordance with Practice D 3567 once per every production lot. Total and reinforced wall thickness shall be as specified in Table 2. Any out of tolerance components shall be rejected.

9.3 Flanges and Mitered Fittings:

9.3.1 Pressure Tests—One mitered fitting from each lot shall be tested to a pressure equal to or greater than 1.5 times the pipe system rating. All samples shall hold the test pressure for a minimum of 2 min.

9.3.2 Lot Size—A lot shall consist of 20 flanges or 10 mitered fittings of any given configuration.

9.3.3 Degree of Cure—The Tg shall be determined at a minimum frequency of one test per production lot. If the measured value is more than 10°F less than the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.3.4 Glass Content—The glass content (mass fraction expressed as percentage) of at least one sample per production lot shall be determined in accordance with Test Method D 2584. If the measured value is not within 5% of the value in the manufacturer’s specification, the lot is rejected or subject to retest.
shall be determined in accordance with Test Method D 2584. If the measured glass content is not within 5% of the value in the manufacturer’s specification, the lot is rejected or subject to retest.

9.3.5 Wall Thickness—Total wall thickness and reinforced wall thickness shall be determined in accordance with Practice D 3567 once per every production lot. Total and reinforced wall thickness shall be as specified in Table 2. Any out-of-tolerance components shall be rejected and the remainder of the lot be subject to retest.

9.4 Retest—If any test result in 9.1, 9.2, or 9.3, or combination thereof, fails to conform to the specified requirements, the manufacturer shall be permitted to elect to reject the entire lot, or retest two additional samples from the same lot. If both of the retest specimens conform to the requirements, all items in the lot shall be accepted except the sample which initially failed. If one or both of the retest samples fail to conform to the specified requirements, the manufacturer shall reject the entire lot or test individually the remaining samples in the lot in accordance with 9.1.1, 9.2.1, or 9.3.1, as applicable. Note that in the final case, all samples need only be subjected to the tests that the original samples failed.

9.5 Production Quality Documentation—The manufacturer shall have manufacturing procedures for each component to be supplied, raw material test certificates for each component to be used in manufacturing, and production quality control reports available for the procurement officer.

10. Certification

10.1 The pipe manufacturer shall be registered by an accredited agency to meet the requirements of ISO 9001. For purposes of this specification, the manufacture shall be considered a “special process” as defined in ISO 9001, Section 4.9.

11. Product Marking

11.1 Pipe and fittings shall be marked with the name, brand, or trademark of the manufacturer; NPS; manufacture date; pressure rating; pressure rating method; and other information upon agreement between the manufacturer and the purchaser.

12. Keywords

12.1 epoxy resin fittings; epoxy resin pipe; marine piping; nominal pipe size; thermoset epoxy resin pipe

APPENDIXES

(Nonnmandatory Information)

X1. DETERMINATION OF INTERNAL PRESSURE RATING FOR PIPE, FITTINGS, AND JOINTS

X1.1 Internal pressure rating for a piping system shall be determined using one of four methods. The method used to determine this rating shall be clearly identified by the manufacturer in published literature.

X1.1.1 Rating Method 1—Short-Term Test Method—Two samples of each pipe, joint, fitting, or other component shall be tested in accordance with Test Method D 1599 at ambient temperature. The maximum rating for mitered (hand lay-up) fittings shall be determined by dividing the lesser result by a safety factor of 2.5. The maximum rating for all other components shall be determined by dividing the lesser result by a safety factor of 4.0.

X1.1.2 Rating Method 2—Medium-Term (1000-h) Test—Two samples of each pipe, joint, fitting, or other component are to be tested in accordance with Test Method D 1598 for a period of 1000 h at the rated temperature. Both specimens must survive the exposure period without leakage. The maximum rating for mitered (hand lay-up) fittings shall be determined by dividing the test pressure by a safety factor of 2.0. The maximum rating for all other components shall be determined by dividing the test pressure by a safety factor of 1.87.

X1.1.3 Rating Method 3—Long-Term (10 000-h) Test—Two samples of each pipe, joint, fitting or other component are to be tested in accordance with Test Method D 1598 for a period of 10 000 h at the rated temperature. Both specimens must survive the exposure period without leakage. The maximum rating for mitered (hand lay-up) fittings shall be determined by dividing the test pressure by a safety factor of 1.5. Scaling of the results is allowed upon agreement between the manufacturer and the purchaser.

X1.1.4 Rating Method 4—Long-Term (10 000-h) Regression Test—Pipe, fittings, and joints shall be tested in accordance with Practice D 2992 Procedure B at the rated temperature. The pressure rating for all components shall be determined in accordance with the hydrostatic design basis (HDB) and lower confidence limit (LCL) as calculated in the test method. Ratings shall be determined by dividing the LCL at 20 years by a factor of 1.5. Scaling of the results is allowed for pipe bodies only in accordance with the ISO equation:

\[
S \times SF = P(D - t_r)/2t_r
\]

where:
- S = hoop stress, psi (kPa),
- SF = service factor,
- D = mean reinforced diameter (OD - t) or (ID + t), in. (mm),
- P = internal pressure psig (kPa), and
- t_r = minimum reinforced wall thickness, in. (mm).

NOTE X1.1—Liner thickness is not to be used in determining inside diameter.

NOTE X1.2—Coating thickness is not to be used in determining outside diameter.
X2. FIRE PERFORMANCE TESTS

X2.1 Fire performance tests shall be performed at an independent third-party laboratory to the satisfaction of the authority having jurisdiction.

X2.2 Piping Material Systems:
X2.2.1 All fire endurance, flame spread, and smoke and toxicity testing, where required, shall be conducted on each piping material system.
X2.2.2 Changes in either the type, amount, or architecture, or combination thereof, of either the reinforcement materials, resin matrix, liners, coatings, or manufacturing processes shall require separate testing in accordance with the requirements of this specification.

X2.3 Fire-Protective Coatings:
X2.3.1 Where a fire-protective coating is necessary for achieving the fire endurance, flame spread, or smoke and toxicity criteria, the following requirements apply:
X2.3.1.1 Pipes shall be delivered from the manufacturer with the protective coating on. On site application will be limited to what is physically necessary for installation (that is, joints).
X2.3.1.2 The fire-protection properties (that is, fire endurance, flame spread, smoke production, and so forth) of the coating shall not be diminished when exposed to (1) salt water, oil, or bilge slops, (2) other environmental conditions such as high and low temperatures, high and low humidity, and ultraviolet rays, or (3) vibration.
X2.3.1.3 The adhesion qualities of the coating shall be such that the coating does not flake, chip, or powder, when subject to an adhesion test.
X2.3.1.4 The fire-protective coating shall be resistant to impact and abrasion. It shall not be separated from the piping during normal handling.

X2.4 General Fire Endurance Test Requirements:
X2.4.1 All typical joints, including but not limited to pipe to pipe, fiberglass flange to fiberglass flange, and fiberglass flange to metallic flange intended to be used shall be tested. Elbows and tees need not be tested provided the same adhesive or method of joining utilized in straight piping tests will be used in the actual application.
X2.4.2 Qualification of piping systems of sizes different than those tested shall be allowed as provided for in Table X2.1. This applies to all pipe, fittings, system joints (including joints between metal and fiberglass pipes and fittings), methods of joining, and any internal or external liners, coverings, and coatings required to comply with the performance criteria.
X2.4.3 No alterations to couplings, fittings, joints, fasteners, insulation, or other components shall be made after the commencement of the fire endurance testing. Flange bolts shall not be retorqued after completion of the fire exposure testing, before hydrostatic testing. Postfire hydrostatic testing shall be conducted without altering the component in any way.

X2.5 Fire Type JF–Jet Fire—This test is based upon Health & Safety Executive document OTI 95 634, except that is modified so that actual pipe, joints, and fittings are exposed to the flame.

X2.5.1 Equipment:
X2.5.1.1 A propane vaporization and propulsion system capable of delivering $0.66 \pm 0.11$ lb/s ($0.3 \pm 0.05$ kg/s) flow under controlled conditions into a backing “box” which has the test specimen mounted at the box’s front opening. The nozzle shall be a tapered, converging type, 7.875 in. (200 mm) in length with an inlet diameter of 2.0 in. (52 mm) and an outlet diameter of 0.70 in. (17.8 mm). The nozzle is to be located 3.281 ft (1.0 m) from the front of the box, centered across the box, and mounted horizontally between 15 in. (375 mm) and 30 in. (750 mm) from the bottom of the box. The flow shall directly impinge on the test specimen.
X2.5.1.2 Water-handling and timing equipment suitable for delivering sufficient quantities of water to produce a fluid velocity of 3 ft/s (0.91 m/s) at the rated pressure of the piping system being tested.
X2.5.1.3 Instrumentation to record fuel flow rate, water flow rate, temperatures in the specimen and in various locations in the backing panel, and water leakage rate from the pipe assembly or individual components.
X2.5.2 Test Specimen—The test specimen shall be prepared with the joints, fittings, and fire-protection coverings, if any, intended for use in the proposed application. It is up to the authority having jurisdiction to determine the number and size of test specimens, as well as requirements for the qualification of a range of pipe diameters.
X2.5.3 Test Conditions:
X2.5.3.1 If fire-protective coatings or coverings contain or are liable to absorb moisture, the test specimen shall not be tested until the insulation has reached an air-dry condition. This condition is defined as equilibrium with an ambient temperature that is within 50 % relative humidity of 70 \pm 10°F (20 \pm 5°C). Where fire-protective coatings or coverings are required to enable a pipe system to pass a fire endurance test, the coatings’ or coverings’ properties should not degrade over time or due exposure to the environment as discussed in IMO FTP Code Res A.753(18) Paragraph 2.2.6, or both.
X2.5.3.2 The test specimen shall be planar and shall be mounted flush to the opening of a 5 by 5-ft (1.5 by 1.5-m) open-ended, steel box (closed back panel with a depth of 1.64 ft (0.5 m). Suitable auxiliary equipment shall be attached to the box to ensure the box’s structural stability and to prevent any

X2.5.3.3 If required to record temperature conditions during testing, mount thermocouples on the specimen and within the box or its structure.

X2.5.3.4 The test building shall be suitably constructed to ensure there is not a hazardous amount of heat or smoke allowed to accumulate during or after the test.

X2.5.3.5 Before conducting the test, calibration runs of the gas flow controls and water flow system shall be conducted.

X2.5.3.6 Fuel used shall be commercial grade propane delivered to the nozzle as a vapor without a liquid fraction.

X2.5.4 Test Procedure:

X2.5.4.1 Pressure test each test specimen to 1.5 times its rated pressure prior to mounting in the test rig. No leakage is allowed during this test.

X2.5.4.2 Unless Fluid S is specified, completely drain the specimen of water after the initial test and secure into position. Make all thermocouple and plumbing connections at this time. For Fluid S conditions, secure the specimen into position filled with water.

X2.5.4.3 It is acceptable to start the test using a small “pilot” flame to ensure safe ignition of the fuel before full flow being established.

X2.5.4.4 Increase the flow to the rate as specified in X2.5.1.1. This rate has been shown to produce a heat flux between 95 100 and 126 800 Btu/(h-ft²) (300 and 400 kW/m²). Timing of the test is to begin when the specimen is fully engulfed. Establish fully controlled flow within 30 s of the start of the test.

X2.5.4.5 If Fluid E or S is specified in 4.3.1, then continue the test for a minimum of 20 min under the initial conditions.

X2.5.4.6 If Fluid EF in 4.3.1 is specified, take the following steps:

1. Continue the test in the dry condition for 5 min.

2. After the 5-min dry period, introduce water at a flow velocity not to exceed 3.0 ft/s. Pressure in the system is to be maintained at a minimum of 90 % of the rated pressure for the system. These conditions are to be established within 1 min after the flow of water begins.

3. Continue the test under flowing water conditions for a minimum of 15 min.

X2.5.4.7 Increased exposure times over those previously specified are acceptable upon agreement between the manufacturer and the buyer.

X2.5.4.8 Upon completion of the fire exposure period, discontinue the fuel flow, extinguish the flame, and allow the sample to cool (with flowing water, if desired) to room temperature.

X2.5.4.9 After cooling, pressurize the specimen at it’s rated pressure for a minimum of 15 min with stagnant water (make-up water is allowed). Measure overall leakage and leakage of each component and record after this period.

X2.5.5 Acceptance Criteria—Piping shall be deemed to have passed the test if the performance meets the criteria set by the authority having jurisdiction regarding integrity and duration in 4.3.3. If no criteria is established, a maximum leakage of 10 % of the rated flow will be used as the default limit.

X2.5.6 Report—Report the following information:

X2.5.6.1 Complete identification of the pipe or fitting tested including the manufacturer’s name and code.

X2.5.6.2 Description of fire-protective coating, if applicable.

X2.5.6.3 Diameter of pipe, fitting, or joint.

X2.5.6.4 Endurance time.

X2.5.6.5 Appearance of test specimen.

X2.5.6.6 Date of test.

X2.5.6.7 Leakage rate.

X2.6 Fire Type HF—Hydrocarbon Furnace Test Method—This test method covers the determination of the fire endurance of thermosetting resin fiberglass pipe, fittings, and joints to be used in marine applications. The procedure in Test Method E 1529 with additional steps as outlined shall be followed. This procedure is similar to IMO Assembly Resolution A.753(18), Appendix 1, which is an alternative to this test.

X2.6.1 Significance—This test method is intended to provide a basis for evaluating the time period during which fiberglass pipe will continue to perform its intended function when subjected to a controlled, standardized fire exposure. In particular, the standard exposure condition of Test Method E 1529 simulates the condition of total continuous engulfment of a pipe or piping system in the luminous flame (fire plume) area of a large, free-burning hydrocarbon pool fire. The standard fire exposure is defined in terms of the total flux incident on the test specimen together with the appropriate temperature conditions.

X2.6.2 Test Equipment:

X2.6.2.1 Furnace—The setup and control of the test shall be as specified in Sections 6 through 11 of Test Method E 1529.

X2.6.2.2 Nitrogen tank with regulator or water circulating system with flow meters.

X2.6.3 Test Specimen:

X2.6.3.1 If fire-protective coatings or coverings contain or are liable to absorb moisture, the test specimen shall not be tested until the insulation has reached an air-dry condition. This condition is defined as equilibrium with an ambient temperature at 50 % relative humidity of 70 ± 10°F (20 ± 5°C). Where fire-protective coatings or coverings are required to enable a pipe system to pass a fire endurance test, the coatings or coverings properties should not degrade over time or due to exposure to the environment as discussed in IMO FTP Code Res A.753(18) Paragraph 2.2.6, or both.

X2.6.3.2 Accelerated conditioning is permissible provided the test method does not alter the properties of component materials.

X2.6.3.3 Special samples shall be used for moisture content determination and conditioned with the test specimen. Construct these samples in such a way as to represent the loss of water vapor from the specimen by having similar thickness and exposed faces.

X2.6.3.4 Prepare the test specimen with the joints, fittings, and fire-protection coverings, if any, intended for use in the proposed application.
X2.6.3.5 The number of specimens shall be sufficient to test typical joints as noted in X2.4.1.

X2.6.3.6 For specimens to be tested using Fluid E, the ends of the specimen shall be closed with one end allowing pressurized nitrogen to be connected. Specimens to be tested with Fluid EF and S shall have both ends closed with means to connect the water supply.

X2.6.3.7 It is permissible for the pipe ends and closures to be outside the furnace.

X2.6.3.8 The general orientation of the specimen shall be horizontal and it shall be supported by one fixed support. Remaining supports shall allow free movement.

X2.6.3.9 Special samples shall be used for moisture content determination and conditioned with the test specimen. Construct these samples so as to represent the loss of water vapor from the specimen by having similar thickness and exposed faces.

X2.6.3.10 When testing with Fluid E, nitrogen pressure inside the test specimen shall be maintained automatically at 10.1 ± 1.5 psi (0.7 ± 0.1 bar) during the test. Means shall be provided to record the pressure inside the pipe and the nitrogen flow into and out of the specimen to indicate leakage.

X2.6.4 Procedure:

X2.6.4.1 Measure the dimensions of the specimen in accordance with Practice D 3567. Include measurements of liner thickness and external coatings, if applicable.

X2.6.4.2 Place specimen in the furnace.

X2.6.4.3 Pressurize specimens to be tested with Fluid E with nitrogen maintaining the pressure in accordance with X2.6.3.10. Specimens to be tested with Fluid EF shall be initially filled with ambient air for 5 min and then with water flowing with a maximum velocity of 3 ft/s and 44 ± 7 psi (3 ± 0.5 bar). Specimens to be tested with Fluid S shall be filled with water at 44 ± 7 psi (3 ± 0.5 bar).

X2.6.4.4 Subject the piping or piping system to the fire exposure specified in Section 6 of Test Method E 1529 for the time specified by the authority having jurisdiction.

X2.6.4.5 After termination of the furnace test, allow the specimen, together with any fire-protective coating, to cool in still air to ambient temperature and then test to the rated pressure for 15 min.

X2.6.5 Acceptance Criteria—Pipe shall be deemed to pass the test if the performance meets the customer specified integrity/duration in 4.3.3. Note that, to meet IMO A753(18), Level 1 or Level 2 requirements, Fluid E shall be tested and there shall be no nitrogen leakage during the test or water leakage during the hydrotest in X2.6.4.5. For Level 1 or Level 2, the duration of the test is 60 or 30 min, respectively.

X2.6.6 Report—Report the following information:

X2.6.6.1 Complete identification of the pipe or fitting tested including manufacturer’s name and code.

X2.6.6.2 Description of fire-protective coating, if applicable.

X2.6.6.3 Diameter of pipe, fitting, or joint.

X2.6.6.4 Endurance time.

X2.6.6.5 Appearance of test specimen.

X2.6.6.6 Date of test.

X2.7 Fire Type IF–Impinging Flame:

X2.7.1 Scope—This test method covers the determination of the fire endurance of thermosetting resin fiberglass pipe, fittings, and joints to be used in marine applications. This test procedure is based on the IMO Assembly Resolution A.753(18) Appendix 2, which is an alternate procedure.

X2.7.2 Summary of Test Method—This test method subjects a pipe sample to a constant 36 011-Btu/(h-ft²) (113.6-kW/m²) net flux to determine a pipe systems fire-endurance.

X2.7.3 Test Equipment:

X2.7.3.1 Sievert No. 2942 Burner or Equivalent, which produces an air mixed flame. Propane with a minimum purity of 95 % should be used.

(1) The inner diameter of the burner heads shall be 1.14 in. (29 mm).
(2) The burner heads shall be mounted in the same plane and supplied with gas from a manifold (see Fig. X2.1).

(3) Each burner shall be equipped with a valve, if necessary, to adjust the flame height.

(4) It is acceptable to use a burner stand or pipe supports with an adjustable height.

(5) The distance between the burner heads and the pipe shall be maintained at 5 ± 3/8 in. (125 ± 10 mm) during the test.

(6) The free length of pipe between supports shall be 31.5 ± 2 in. (800 ± 50 mm).

X2.7.3.2 Thermocouples—Two thermocouples capable of measuring up to 2012°F (1100°C).

X2.7.3.3 Water.

X2.7.3.4 Thermometer, to measure internal water temperature.

X2.7.3.5 Pressure Gage, which is capable of reading up to 73 psi (5 bar) ± 5%.

X2.7.3.6 V-shaped Pipe Supports, two.

X2.7.4 Test Specimen:

X2.7.4.1 The test specimen shall be 59 in. (1.5 m) long.

X2.7.4.2 Pipe with permanent joints or fittings intended for use in marine applications shall be used in the specimen.

X2.7.4.3 All joint types shall be tested as noted in X2.4.1.

X2.7.4.4 The quantity of pipe specimens shall be sufficient to test all typical joints and fittings.

X2.7.4.5 A pressure relief valve shall be connected to one of the end closures of the system.

X2.7.5 Test Conditions:

X2.7.5.1 If fire-protective coatings or coverings contain or are liable to absorb moisture, the test specimen shall not be tested until the insulation has reached an air-dry condition. This condition is defined as equilibrium with an ambient temperature at 50% relative humidity of 70 ± 10°F (20 ± 5°C). Where fire-protective coatings or coverings are required to enable a pipe system to pass a fire endurance test, the coatings’ or coverings’ properties should not degrade over time or as a result of exposure to the environment as discussed in IMO FTP Code Res A.753(18) Paragraph 2.2.6, or both.

X2.7.5.2 Accelerated conditioning is permissible provided the test method does not alter the properties of component materials.

X2.7.5.3 Special samples shall be used for moisture content determination and conditioned with the test specimen. Construct these samples so as to represent the loss of water vapor from the specimen by having similar thickness and exposed faces.

X2.7.5.4 The test shall be carried out in a sheltered test site to prevent any draft from influencing the test.

X2.7.5.5 Specimens to be tested with Fluid E shall be pressurized with nitrogen maintaining the pressure in accordance with Appendix X2. Specimens to be tested with Fluid EF shall be initially filled with ambient air for 5 min and then with water flowing with a maximum velocity of 3 ft/s and 44 ± 7 psi (3 ± 0.5 bar). Specimens to be tested with Fluid S shall be filled with water at 44 ± 7 psi (3 ± 0.5 bar).

X2.7.5.6 The water temperature when testing with Fluids S and EF shall not be less than 59°F (15°C) at the start of the test and shall be measured at a maximum of 5-min intervals during the test.

X2.7.5.7 Flame Temperature:

(1) The exterior flame temperature shall be measured by means of two thermocouples mounted not more than 1 in. (25 mm) from the pipe near the center span of the assembly.

(2) The thermocouples shall be mounted on the horizontal plane at the level of the pipe.

(3) The test temperature shall be taken as the average of the two thermocouple readings.

X2.7.6 Procedure:

X2.7.6.1 Measure the dimensions of the specimen in accordance with Practice D 3567. Include measurements of liner thickness and external coatings, if applicable.

X2.7.6.2 Place the specimen on two V-shaped supports. The two stands shown in Fig. X2.1 are permissible supports.

X2.7.6.3 Pressurize the specimen with water as required in accordance with Appendix X2. Specimens to be tested with Fluid EF shall not be less than 59°F (15°C) at the start of the test.

X2.7.6.4 Burner Configuration for Constant Heat Flux:

(1) For piping 6 in. or less in diameter, the fire source shall consist of two rows of 5 burners as shown in Fig. X2.2.

(2) A constant heat flux averaging 36 011 Btu/(h-ft²) (113.6 kW/m²) ± 10% shall be maintained 5 ± 3/8 in. (125 ± 10 mm) above the centerline of the array.

(a) This flux corresponds to a premix flame of propane of a minimum 95% purity with a fuel flow rate of 11.02 lb/h (5 kg/h) for a total heat release of 221 780 Btu/h (65 kW).

(b) The gas consumption shall be measured with an accuracy of ±3% in order to maintain a constant heat flux.

(3) For piping greater than 6 in. in diameter, one additional row of burners shall be included for each 2-in. increase in diameter while maintaining the heat flux in X2.7.6.4.

(4) Begin the heat flux.

(5) Record the test temperature and water temperature and pressure, if applicable, at the beginning of the test, at the end of the test, and at maximum 5-min intervals during the test.
X2.7.6.5 Expose the test specimen to flame for 30 min.
X2.7.6.6 After termination of the burner regulation, test the test sample, together with the fire-protective coating, if any, shall be allowed to cool to ambient temperature and then tested to the rated pressure of the pipe. If fire-protective coverings are used, then conduct the pressure test without the covering, where practical.

(1) Hold the pressure for a minimum of 15 min.

X2.7.7 Acceptance Criteria—Piping shall be deemed to have passed the test if the performance meets the criteria set by the authority having jurisdiction regarding integrity and duration in 4.3.3.

X2.7.8 Report—Report the following information:
X2.7.8.1 Complete identification of the pipe or fitting tested including the manufacturer’s name and code.
X2.7.8.2 Description of fire-protective coating, if applicable.
X2.7.8.3 Diameter of pipe, fitting, or joint.
X2.7.8.4 Endurance time.
X2.7.8.5 Appearance of test specimen.
X2.7.8.6 Date of test.
X2.7.8.7 Leakage rate.

X2.8 Flame Spread:
X2.8.1 Flame spread testing of fiberglass piping shall be conducted in accordance with Appendix 3 of IMO Resolution A.753(18) except as modified in X2.8.2.
X2.8.2 Testing need not be conducted on all piping sizes. Only the sizes with the maximum and minimum wall thickness to be used must be tested.

X2.9 Smoke and Toxicity:
X2.9.1 Smoke and toxicity testing of fiberglass piping shall be conducted in accordance with Annex 1, Part 2—Smoke and Toxicity Test, of IMO Resolution MSC.61(67) except as modified in X2.9.2-X2.9.12. These modifications are similar to those in Appendix 3 of IMO A.753(18) except they apply to the smoke and toxicity test, not the surface flammability test.
X2.9.2 Testing shall be conducted on piping sizes with the maximum and minimum wall thickness intended to be used.

X2.9.3 The test sample shall be fabricated by cutting pipes lengthwise into individual sections and then assembling the sections into a test sample as representative as possible of a flat surface. All cuts shall be made normal to the pipe wall.
X2.9.4 The number of sections that must be assembled together to form a square test sample with sides measuring 3 in. shall be that which corresponds to the nearest integral number of sections which will result in a test sample with an equivalent linearized surface width between 3 and 3.5 in. The surface width is defined as the measured sum of the outer circumference of the assembled pipe sections normal to the lengthwise sections.
X2.9.5 The assembled test sample shall have no gaps between individual sections.
X2.9.6 The assembled test sample shall be constructed in such a way that the edges of two adjacent sections will coincide with the centerline of the test holder.
X2.9.7 The test samples shall be mounted on calcium silicate board and held in place by the edges of the test frame and, if necessary, by wire.
X2.9.8 The individual pipe sections shall be mounted so that the highest point of the exposed surface is in the same position as the plane of an equivalent flat plate.
X2.9.9 The space between the concave unexposed surface of the test sample and the surface of the calcium silicate backing board shall be left void.
X2.9.10 The void space between the top of the exposed test surface and the bottom edge of the sample holder frame shall be filled with a high-temperature insulating wool where the pipe extends under the frame.
X2.9.11 When the pipes are to include fireproofing or coatings, the composite structure consisting of the segmented pipe wall and fire proofing shall be tested and the thickness of the fireproofing shall be the minimum thickness specified for the intended usage.
X2.9.12 The test sample shall be oriented in the apparatus such that the pilot burner flame will be normal to the lengthwise piping sections.

X3. ELECTRICAL PROPERTY TEST METHODS FOR CONDUCTIVE FIBERGLASS PIPING

X3.1 Test Method for Determination of Charge Shielding Properties of Reinforced Thermo-setting Resin Pipe, Fittings, and Joints:

X3.1.1 Summary of Test Method—In this test method, a high-voltage electric field is applied to the interior surface of a grounded reinforced thermosetting resin pipe, fitting, or joint, and the resulting voltage on the exterior surface, if any, is measured. This test can also be used to determine the effect of typical chemical exposure on the conductive properties of the pipe, fittings, and joints.
X3.1.2 Test Equipment:
X3.1.2.1 DC Supply, capable of producing a minimum voltage of 1000 V.
X3.1.2.2 Fieldmeter, capable of measuring and displaying electric fields values of 100 V·m⁻¹ with zero stable within 50 V·m⁻¹ over at least 1000 s. A reading of 100 V·m⁻¹ shall be at least 10% of an analog scale reading or at least the second digit of a digital display. The instrument display shall give a linear response to electric field, symmetric with polarity and with no hysteresis. These properties shall be within 5% of full-scale reading of the operating range. The output time constant at the display shall be less than 1 s.
X3.1.3 Sample Preparation:
X3.1.3.1 The minimum NPS of the pipe, fitting, or joint tested shall be 2.
X3.1.3.2 For pipe specimens, the minimum length of the sample shall be seven times the NPS.
X3.1.3.3 If necessary to provide space for a grounding clamp, add further sections of conductive pipe, as necessary, to the specimen using the manufacturer’s normally recommended assembly methods for conductive joints. If a joint is required, then the resistance across the joint shall be determined in accordance with X3.2.
X3.1.3.4 Identify a minimum of five locations on the outside of the component for positioning the fieldmeter. Ensure that the locations around the periphery are equally spaced over the length of the component. It is possible that additional locations are needed to account for regions where there is a change in component geometry.

X3.1.4 Conditioning:
X3.1.4.1 The test specimen shall not be tested until the material has reached an air-dry condition. This condition is defined as 16 to 24 h at an ambient temperature of 73.4 ± 3.6°F (23 ± 2°C) and 50 ± 5 % relative humidity.
X3.1.4.2 If the effect of the environment on the electrical properties is required, place the specimens in a test tank so that they are completely immersed in the test fluid. Maintain the temperature of the bath at 60 to 80°F (15 to 27°C) throughout the test.

(1) At the end of three months, remove the test specimen from the tank and rinse thoroughly with tap water if the specimen has been exposed to a water-soluble product or a hydrocarbon solvent if the specimen has been exposed to a petroleum product.

(2) Wipe dry and place the test specimen in an oven at 149 ± 10°F (65 ± 5°C) for a period of 2 h.

(3) Remove the specimen from the oven and allow it to cool to 70 to 80°F (21 to 27°C) in a 50 ± 5 % relative humidity environment for 16 to 24 h.

X3.1.5 Procedure:
X3.1.5.1 Install a grounding clamp of the earthing system on the exterior of the specimen at each end of the component in accordance with the manufacturer’s instructions. Any surface preparation shall not exceed that normally required when installing a piping system.

X3.1.5.2 Blank off each termination of the specimen assembly with a suitable removable plug made from an insulating material which is in contact with just the inside surface of the component. One of the plugs shall be provided with an electrode that passes through the thickness of the material. For fittings, this electrode shall be a minimum distance of 12 in. (305 mm) away from the main body of the fitting. An additional section of conductive pipe shall be added as necessary to the component in accordance with X3.1.3.3.

X3.1.5.3 Completely fill the inside of the specimen with a suitable conducting fluid. It is acceptable to fit one or more of the plugs with a vent fitting to enable air to be expelled. Ensure the outside of the specimen is dry.

X3.1.5.4 Position the specimen vertically on a nonconducting surface or suspend it with non-electrically conducting materials in a manner to ensure that the outside of the component under test is accessible on all sides. The plug with the electrode shall be positioned such that the inside is in contact with the conducting fluid.

X3.1.5.5 Connect the electrode in the plug to the dc supply.
X3.1.5.6 Position the fieldmeter 1 in. (25 mm) from the exterior surface of the component under test. The fieldmeter shall be a minimum distance of 12 in. (305 mm) away from the wire connecting the dc supply to the electrode in the plug.

X3.1.5.7 With the specimen connected to earth using the grounding clamp, turn the dc supply on and monitor the output of the fieldmeter for 1 min. Turn off the dc supply.

X3.1.5.8 Repeat X3.1.5.6 and X3.1.5.7 for the remaining test positions.

X3.1.6 Report—Report the following information:
X3.1.6.1 Manufacturer of pipe, fitting, or joint.
X3.1.6.2 Designation of the product being tested.
X3.1.6.3 Description of the test sample including diameter of pipe, fitting, or joint and lengths of pipe extenders, if used.
X3.1.6.4 Description of grounding details.
X3.1.6.5 Test media if exposure is done.
X3.1.6.6 Conducting fluid used.
X3.1.6.7 dc supply voltage.
X3.1.6.8 Record of voltage output from the fieldmeter for 1 min for each test position and after exposure for one, three, six, and twelve months when exposure testing is done.
X3.1.6.9 Appearance of test specimen.
X3.1.6.10 Date.

X3.2 Test Method for Determining the Electrical Resistance Per Unit Length of Fiberglass Pipe, Fittings, Joints, and Representative Piping Systems:

X3.2.1 Summary of Test Method—In this test method, the length of the potential current path is measured and then the resistance is determined using a suitable megohmmeter capable of measuring resistance between 2000 and 1 × 10¹⁰ Ω. The test method is also useful to determine the effect of typical chemical exposures on the conductive properties of the pipe. The results are expressed in terms of resistance per unit length.

X3.2.2 Test Equipment:
X3.2.2.1 Megohmmeter, capable of measuring resistance between 2000 and 1 × 10¹⁰ Ω with a resolution of 5 %. The voltage between the electrodes shall be a minimum of 500 V.

X3.2.3 Test Specimen:
X3.2.3.1 Pipe.

(1) The pipe length shall be 3.28 ft (1 m) or six times the nominal diameter of the product plus two times the width of the grounding clamps, if applicable, whichever is greatest.

X3.2.3.2 Pipe with Fitting or Joint, or Both:

(1) NPS 2 piping shall be used unless otherwise specified.

(2) The electrical construction of the pipe shall be consistent with that of the fitting and joint.

(3) The joint or fitting shall be attached to two lengths of pipe. It is possible that this will require some fittings, for example, flanges, to be assembled in pairs. The length of each pipe shall be six times the nominal diameter of the product plus one times the width of the grounding clamps, if applicable. If needed to achieve this length, add further sections of conductive pipe using the manufacturer’s recommended assembly methods.
X3.2.4 Conditioning—The test specimen shall not be tested until the material has reached an air-dry condition. This condition is defined as 16 to 24 h at an ambient temperature of 73.4 ± 3.6°F (23 ± 2°C) and 50 ± 5 % relative humidity.

X3.2.5 Procedure:

X3.2.5.1 Where the electrical conductivity properties of the pipe and joint/fitting combination is to be evaluated, first determine the electrical properties of the pipe on its own.

X3.2.5.2 Current Path Selection—The current paths of interest are as follows:

1. Inside surface of the pipe at one end of the test assembly to the outside surface of the pipe at the other end of test assembly.
2. Outside surface of the pipe at one end of the test assembly to the outside surface of the pipe at the other end of test assembly.

X3.2.5.3 Sample Preparation:

1. Attach a suitable electrode (see Note X3.1) or grounding clamp to the outside diameter of a pipe on one end of the pipe or assembly.
2. Where a grounding clamp is applied, the surface preparation shall not exceed that used when piping systems are installed in accordance with the manufacturer’s recommendations.

3. Apply two suitable electrodes, one around the interior circumference of the specimen and one around the exterior circumference, on the other end of the pipe or assembly. Where the test is being carried out to confirm continuity of the embedded conducting elements within the component body, it is permissible to use the exterior electrode as a grounding clamp that is applied in a similar manner to the first.

4. The distance of the electrodes from the end of the specimen shall be greater than or equal to twice the specimen thickness. The width of the electrodes shall be between four and six times the specimen wall thickness.

Note X3.1—A suitable electrode shall provide the necessary conductivity to the surface of the pipe without causing damage to the surface. Examples include conductive paints, conductive adhesive tape, and brine-soaked sponges held in place with clamps.

X3.2.5.4 Outside-to-Outside Surface Electrical Measurement:

1. Isolate the test specimen from ground.
2. Attach suitable wires to the external electrodes.
3. Determine the resistance using the megohmmeter.
4. The power applied neither should exceed 3.41 Btu/h (1W), and the electrification time shall not exceed one minute unless otherwise specified. Record the readings from the megohmmeter and its accuracy at that range.
5. If the effect of the environment on the electrical properties is required, place the specimens in the test tank so that they are completely immersed in the test fluid. Maintain the temperature of the bath at 59 to 80°F (15 to 27°C) throughout the test. At the end of three months, remove the test specimen from the bath and rinse thoroughly with tap water if the specimen has been exposed to a water soluble product or a hydrocarbon solvent if the specimen has been exposed to a petroleum product. Wipe dry and place the test specimen in an oven at 149 ± 9°F (65 ± 5°C) for a period of 2 h. Remove the specimen from the oven and allow it to cool to 70 to 80°F (21 to 27°C) in a 50 ± 5 % relative humidity environment for 16 to 24 h. Determine the resistance using the megohmmeter. Note the appearance of the test specimen and the condition of the clamps.

X3.2.5.5 Inside-to-Outside Surface Electrical Measurement:

1. Isolate the test specimen from ground.
2. Attach suitable wires to the internal and external electrode.
3. Carry out the procedure in accordance with X3.2.5.4.

X3.2.6 Calculation of Pipe and Joint/Fitting Electrical Resistance:

X3.2.6.1 The electrical resistance shall be calculated for the two cases:

1. External-to-external surface of the component.
2. External-to-internal surface of the component.

X3.2.6.2 Care shall be taken to ensure that these two situations are treated separately.

X3.2.6.3 For the pipe tested on its own, the resistance per unit length of pipe shall be calculated by dividing the resistance of the pipe by the length between electrodes.

X3.2.6.4 The resistance of the fitting or joint shall be calculated as follows:

1. Calculate the resistance of each length of pipe attached to the joint or fitting by multiplying the resistance per unit length by the distance from the electrode to the fitting/joint.
2. Subtract two times the pipe resistance from the overall resistance measured across the assembly to give the resistance across the coupling.

X3.2.6.5 The resistance per unit length shall be determined by dividing the resistance by the effective path length. The effective path length depends on the type of fitting and mode tested.

X3.2.6.6 For pipes, straight joints, adapters, couplings, plugs, caps, and bushings, the path length shall be parallel to the centerline axis of the component and shall encompass the length of the component.

X3.2.6.7 For elbows, the path length shall be the length of the component at the mid-bend radius.

X3.2.6.8 For crosses and tees, one path length shall be parallel to the centerline axis of the component and shall encompass the length of the component. The other path length shall be along the shortest path from adjacent openings through each 90° bend.

X3.2.6.9 For laterals, one path length shall be parallel to the centerline axis of the component and shall encompass the length of the component. The second path length shall be along the shortest distance between adjacent openings through the oblique angle. The third path length shall be along the shortest distance between adjacent openings through the obtuse angle.

X3.2.7 Report—Report the following information:

X3.2.7.1 Complete identification of the pipe and fitting/joint/fire-protection coating tested including the manufacturer’s name and code.

X3.2.7.2 Diameter of the pipe, fitting, or joint.

X3.2.7.3 Details of the megohmmeter including name and model number, resolution capability, and voltage applied.
X3.2.7.4 Mode of testing, that is, external surface-to-
external surface or external surface-to-internal surface and
whether grounding clamps were used.
X3.2.7.5 Results of testing:
(1) Resistance per unit length of pipe.
(2) Resistance of fitting/joint.
X3.2.7.6 Environmental exposure time and media where
applicable.
X3.2.7.7 Appearance of specimen.
X3.2.7.8 Date of test.

X4. SUPPLEMENTARY REQUIREMENTS FOR U.S. NAVY USE

X4.1 Scope—This appendix shall be applied only when
specified by the purchaser in the inquiry, contract, or order.
This appendix contains special material, design, and perfor-
mance considerations and supplemental tests required when
fiberglass piping is to be used for U.S. Navy applications.
These requirements shall in no way negate any requirement of
the specification itself.

X4.2 Special Material, Design, and Performance Consid-
erations:

X4.2.1 Unless otherwise specified in the ordering informa-
tion, fiberglass pipe and fittings shall be rated for a minimum
of 200-psig static pressure at a minimum of 150°F.

X4.2.2 Physical Properties—Pipe and fittings shall have the
physical properties outlined in this section. Unless otherwise
specified in the ordering information, all physical properties
shall be determined at no less than 75°F.

X4.2.2.1 Cyclic Pressure Strength—Pipe, fittings, and ad-
hesive bonded joints shall be cycled a minimum of 10 000
cycles with no signs of leakage or weeping when tested in
accordance with X4.3.2.

X4.2.2.2 Hydrostatic Strength—Pipe, fittings, and joints
shall show no signs of leakage or weeping when tested in
accordance with X4.3.3.

X4.2.2.3 Ultimate Tensile Strength—The minimum longitudi-
nal tensile strength of sample pipe shall be 8500 psi at 75°F
or higher when tested in accordance with Test Method D 2105.

X4.2.2.4 Beam Elastic Modulus—The minimum elastic
modulus of pipe shall be 1 000 000 psi at 150°F when
determined in accordance with Specification D 5686.

X4.2.2.5 Hydrostatic Burst Strength—The minimum hoop
tensile strength of pipe shall be 30 000 psi at 75°F when tested
in accordance with Test Method D 1599.

X4.2.2.6 Low-Cycle Mechanical Fatigue—Piping assem-
blies shall successfully pass the mechanical fatigue test out-
lined in X4.3.3.4 with no visible signs of leakage.

X4.2.3 No asbestos is permitted in the construction of pipe
or fittings.

X4.3 Supplemental Test Methods—Supplemental test meth-
ods shall be conducted at a laboratory satisfactory to the
customer and shall consist of the following test methods.

X4.3.1 Cyclic Pressure Strength—Test specimens shall in-
clude a tee, a flange, and one other fitting selected by the
supplier. The fitting shall be joined to pipe sections at least 18
in. long or three diameters, whichever is longer, using the
joining method, construction, and adhesion intended for field
assembly. Specimen diameters for testing in each configuration
shall include the maximum product size for each method of
construction. In addition, the following other sizes shall be tested:

<table>
<thead>
<tr>
<th>Product Size Range (NPS)</th>
<th>Test Specimen (NPS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 1 1⁄2, 2, 3</td>
<td>3</td>
</tr>
<tr>
<td>4, 6</td>
<td>6</td>
</tr>
<tr>
<td>8, 10, 12</td>
<td>12</td>
</tr>
</tbody>
</table>

In each range of product size, the supplier is permitted to
select to test a smaller product size to qualify only the smaller
size. Each assembly shall be cycled at pressures between 0 psig
and two times the static pressure rating for a minimum of
10 000 cycles without failure. Failure shall be classified as any
leakage or weeping from the pipe, fitting, or joint.

X4.3.2 Hydrostatic Strength—Test specimens shall include
a tee, a flange, and one other fitting selected by the supplier.
The fitting shall be joined to pipe sections at least 18 in. long
or three diameters, whichever is longer, using the joining
method, construction, and adhesion intended for field assem-
blies. Specimen diameters for testing in each configuration
shall include the maximum product size for each method of
construction. In addition, the following other sizes shall be tested:

<table>
<thead>
<tr>
<th>Product Size Range (NPS)</th>
<th>Test Specimen (NPS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 1 1⁄2, 2, 3</td>
<td>3</td>
</tr>
<tr>
<td>4, 6</td>
<td>6</td>
</tr>
<tr>
<td>8, 10, 12</td>
<td>12</td>
</tr>
</tbody>
</table>

In each range of product size, the supplier is permitted to
select to test a smaller product size to qualify only the smaller
size. Each assembly shall be subjected to a pressure of two
times the static pressure rating for 5 min, followed by a
pressure drop to 0 psig, and then a repressurization to four
times the static pressure rating for a minimum of 5 min.

X4.3.3 Low-Cycle Mechanical Fatigue Endurance Test
Method—The purpose of this test method is to verify the
integrity of the piping system when it is subjected to external
mechanical fatigue loads and to demonstrate adequate pipe
fatigue endurance under cyclic mechanical loading. The load
values for this test have been derived from past successful
performance in marine applications.

X4.3.3.1 This test method shall be performed on 1, 3, and 6
NPS assemblies which will qualify piping up to 8 NPS. If
qualification for only one size is required, the supplier is
permitted to test that size.

X4.3.3.2 A test assembly and apparatus shall be fabricated
as shown in Fig. X4.1. The assembly shall consist of a flange,
a vertical leg of pipe with a coupling at midspan, a 90º elbow,
and a horizontal leg of pipe terminating at a second flange. The
total length of the vertical leg from the base of the flange to the
centerline of the horizontal leg shall be 10 to 15 times the
nominal pipe diameter. The total length of the horizontal leg
from the centerline of the cycling arm to the vertical leg shall
be one half of the vertical leg length. Fittings shall be attached to the pipe using the joining method, construction, and adhesion intended for field assembly. If more than one type of fitting (that is, Type I and III in accordance with 4.1.1) is intended for qualification, then each type of fitting must be represented.

X4.3.3.3 The fiberglass pipe assembly shall be fitted with a minimum of six strain gages in the following locations on the “outside” of the vertical leg (the side of the pipe which is subjected to tensile stress/strain when the horizontal leg is displaced downward):

1. Within 1/2 in. of the bottom flange.
2. Within 1/2 in. of the top of the coupling.
3. Within 1/2 in. of the bottom of the coupling.
4. Within 1/2 in. of the 90° elbow.
5. Midway between the coupling and the 90° elbow.
6. Midway between the coupling and the bottom flange.

These locations are shown in Fig. X4.1. All gages are to be mounted in-line, to within $\pm 6^\circ$, with the vertical pipe axis to measure axial strain along the vertical pipe leg. The surface of the pipe wall shall be lightly sanded to remove surface roughness at the gage location before installing the gages.

Note X4.1—The following procedure for fully reversed bending ignores (1) the effect of Poisson’s ratio as a result of pressure in calculating the axial stress at the pipe wall and (2) the effect of internal pressure on the mean stress of the pipe wall during fully reversed bending. A further simplification assumes that the bending modulus of the pipe is equal to the axial tensile modulus.

X4.3.3.4 After the pipe assembly has been mounted in the test apparatus, adjust the apparatus so that the assembly is subjected to a stress of 7000 psi. This is done in the following manner:

1. Pressurize the pipe assembly to 50 (±0/−5) psig.
2. Actuate the hydraulic cylinder and displace the horizontal leg of the pipe assembly down to load the vertical pipe leg containing the strain gages under tension.
3. Adjust the displacement of the pipe assembly until the average of all the strain gages indicates an axial strain corresponding to a pipe wall stress of 7000 psi. The axial tensile stress can be approximated by multiplying the strain reading by the pipe’s axial tensile modulus and ignoring Poisson’s effect because of pressure.

4. (4) Record the strain gage reading and note the actuator displacement.

5. (5) Reverse the displacement by moving the horizontal leg of the pipe assembly up until the gages registers the equivalent absolute value of stress under compression as previously registered under tension.

6. (6) Calculate the compressive stress and note the actuator displacement.

X4.3.3.5 Mechanically limit or fix the actuator displacements in the UP and DOWN directions to correspond to the stress values of 7000 psi tensile and 7000 psi compressive.

X4.3.3.6 Begin cycling the actuator and verify that the average of the axial-tensile and compressive strains are repeated at least three times to within $\pm 2\%$.

X4.3.3.7 Cycle the pipe assemblies under fully reversed bending at a rate no greater than 15 cycles per minute for a minimum of 500 cycles or until failure. Failure is defined as the smallest detectable leak, including weeping, from the pipe assembly. Experience has shown that failure often occurs at the strain gage location where the pipe surface has been lightly sanded. Pipe wall weeping which occurs under maximum stress but stops under reduced stress is still a failure. Any leak from a fitting or adhesive-bonded joint shall constitute a failure. It is likely that all failures will occur in the pipe wall. Note that if data is used from any one test assembly cycled to failure, then all assemblies must be cycled to failure to generate consistent results for graphical plotting and extrapolation.

X4.3.3.8 Record the number of cycles to failure for each size of pipe assembly.

X4.3.3.9 Repeat the procedure with an equivalent stress of 6000 psi with a minimum of 2000 cycles.

X4.3.3.10 Repeat the procedure with an equivalent stress of 4000 psi with a minimum of 50 000 cycles.
X4.3.3.11 Plot the stress versus cycles to failure data on a log-log graph and generate the best-fit straight line through the data using the “least squares” method. It is permissible to extrapolate the data linearly to 100 and 100,000 cycles. The graph shall cover stress from 100 to 10,000 psi and cycles to failure from 100 to 100,000 cycles.

X4.3.3.12 The graphed line must be coincident with or above the following stress values: 6000 psi at 1000 cycles; 4500 psi at 10,000 cycles; and 3400 psi at 100,000 cycles. If the graphed line does not meet these criteria, the test specimen shall be considered to have failed the test.

This standard is issued under the fixed designation F 1178; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the performance of a baking primer and enamel on metal for use on fabricated metal products, including marine furniture and joiner work.

1.2 The values stated in inch-pound units are to be regarded as standard. The metric (SI) units, given in parentheses, are for information only.

1.3 Painting facilities shall comply with all applicable Federal and State regulations regarding emissions and waste disposal.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

40 CFR 60 Subpart EE—Standard of Performance for Surface Coating of Metal Furniture

3. Terminology

3.1 Definitions of Terms Specific to This Standard:
3.1.1 air dry touch-up enamel—an air drying enamel that matches the factory applied enamel in color and gloss and is compatible with it.
3.1.2 baking finish—an enamel that requires baking at temperatures above 150°F (65°C) for the development of desired properties.
3.1.3 blister—an enclosed raised spot on the paint surface caused by moisture or solvent trapped under the surface.
3.1.4 cleaning—the first phase of the metal pretreatment prior to painting.
3.1.5 cure—to condense or polymerize a material by heating, resulting in the full development of desired properties.
3.1.6 degreasing—See cleaning.
3.1.7 dry film thickness (DFT)—the actual thickness of the cured paint system. It is measured in mils or thousandths of an inch (0.001 in. or 25.4 µm).
3.1.8 Enamel—a paint characterized by the ability to form an especially smooth film.

3.1.10 gloss—the degree to which a painted surface reflects light.

3.1.11 joiner work—doors, frames, ceilings, bulkheads, window casings, and all trim pieces in accommodation spaces aboard ship.

3.1.12 low gloss—finish that shows a gloss of 25 to 35 when measured with 60° glossmeter. A ceiling gloss is 6 to 16 when measured the same way.

3.1.13 pretreatment—usually restricted to mean the chemical treatment of unpaired surfaces before painting.

4. Ordering Information

4.1 Unless otherwise specified, a smooth, low-gloss enamel finish will be applied.

4.1.1 Color of enamel top coat.

4.1.2 Finish:

4.1.2.1 Smooth.

4.1.2.2 Textured.

4.1.3 Gloss (measured with 60° glossmeter):

4.1.3.1 Low gloss—25 to 35.

4.1.3.2 Ceiling gloss—6 to 18.

5. Materials and Manufacture

5.1 Metal substrate—This specification is intended for use on metal furniture and joiner work of either steel or aluminum.

5.2 For a smooth, low-gloss finish, the furniture or joiner work manufacturer shall follow the procedures in the order and as listed in Sections 6 through 7.

5.3 If a textured finish is specified, the furniture or joiner work manufacturer shall follow the procedures in the order and as listed in Sections 6 through 8.

6. Cleaning and Degreasing

6.1 All exterior and interior surfaces, both visible and concealed, and all joints shall be thoroughly cleaned and degreased.

6.2 The cleaning/rinsing process shall remove dirt, oil grease, moisture, and other foreign matter.

6.3 No detrimental residue from this process shall remain deposited on any surface.

7. Enameling

7.1 All surfaces contributing to the appearance of the final product shall be enamaled to a smooth, low-gloss finish in colors specified in the ordering documents.

7.2 Enamel shall be applied in an amount sufficient to produce a minimum dry film thickness of 1.5 mils (0.0015 in. (38.1 µm)) for joiner doors and frames. For other joiner materials and furniture, 1 to 1.5 mils (0.001 to 0.0015 in. (25.4 to 38.1 µm)) is acceptable.

7.3 The enamel required under this specification shall be a thermosetting type, requiring a high baking schedule for proper cure. This enamel shall satisfy the requirements of Section 9.

8. Texturing (Optional)

8.1 If a textured finish is required by ordering documents, the enamel chosen shall be capable of producing a suitable raised textured finish when using equipment and techniques recommended by the manufacturer.

8.2 All requirements for enameling of the textured finish shall remain as written for the smooth, low-gloss finish except that the gloss shown in 9.2.3.2 shall be 6 minimum to 16 maximum for ceiling panels. Other items may vary according to paint specified.

9. Performance Criteria

9.1 Test Panel Description—Test panels shall be 4½ in. (114 mm) minimum width and 7½ in. (191 mm) maximum length of material and thickness as listed below:

9.1.1 Cold rolled steel sheet, in accordance with Specification A 1008, USSG 20 gauge (0.0359 in. or 0.91 mm) thick.

9.1.2 Galvannealed steel sheet, in accordance with Specification A 653/A 653M with coating designation A 01, CSG 20 gauge (0.0396 in. or 1.01 mm) thick.

9.1.3 Type 5052-H32 aluminum alloy, in accordance with Specification B 209, 0.040 in. (1.02 mm) thick.

9.2 Prepare test panels for testing, test, and evaluate in accordance with the following requirements:

9.2.1 Dry Film Thickness—Measure the total dry film thickness, either prime coat or prime coat plus enamel, on metal test panels or products in accordance with Test Method D 1400. Where only steel products are being enamelled, the dry film thickness may be measured in accordance with Test Methods D 1186.

9.2.2 Primer:

9.2.2.1 Preparation of Primer Test Panels—Clean, pretreat, and coat two metal test panels with primer on both sides and on all edges in the production cycle. After baking the primed test panels, scribe one side of each panel with two diagonal scribe lines that extend through the prime coat down to the base metal. For scribing, use a sharp instrument and a suitable straightedge. Hold the scribing tool perpendicular to the surface of the test panel, and make two intersecting diagonal marks. Begin each scribe line at a point approximately 1/2 in. (13 mm) from a corner and continue to a point approximately 1/2 in. (13 mm) from the diagonally opposite corner. The scribe must penetrate the prime coating down to the metal, leaving a uniformly bright line.

9.2.2.2 Salt Spray Exposure of Primer Test Panels—Expose the metal panels in accordance with Practice B 117 for 250 h at 95°F (35°C). Remove test panels from the salt spray cabinet and rinse them using a gentle stream of water at a temperature of 100 ± 10°F (37.8 ± 5.5°C). Dry the test panels and vigorously scrape the scribed side of each panel with a dull knife blade or a suitable piece of sheet metal having a similar dull edge. Hold the scraper with its face perpendicular to the specimen surface and parallel to the scribe, moving it back and forth across the scribed line. Complete the scraping within 15 min of the drying of the surface. Masking tape, 1 in. (25 mm) wide, shall be pressed onto all scribed marks and pulled away clearly. Evaluate the performance of these test panels per 9.2.2.3 and 9.2.2.4.
9.2.2.3 Evaluation of the Blistering Resistance of Primer Test Panel—There shall be no evidence of blistering of these primed metal panels after 250-h exposure in accordance with Practice B 117.

9.2.2.4 Evaluation of the Corrosion Resistance of Primer Test Panel—Measure creepage, or loss of adhesion due to corrosion, at the scribe marks. This creepage shall not extend more than \( \frac{1}{8} \) in. (3.2 mm) on either side of scribe mark. The total width of gap in prime coat shall not exceed \( \frac{1}{4} \) in. (6.4 mm).

9.2.3 Enamel:

9.2.3.1 Preparation of Enamel Test panels—Clean, pretreat, and coat two metal test panels with primer and enamel in the production cycle to a total dry film thickness of 1 to 1.5 mils (0.001 to 0.0015 in. (25.4 to 38.1 µm)).

9.2.3.2 Gloss—The enamel test panel shall show a gloss of 25 minimum to 35 maximum when measured using a 60° glossmeter (Gardner, Photovolt, or equal) unless otherwise specified in ordering documents or, if a textured finish, gloss shall be as noted in 8.2.

9.2.3.3 Hardness—Conduct this hardness test in accordance with Test Method D 3363 using a standard 2H drafting pencil sharpened to expose the full diameter of the pencil lead. The lead is sanded to a blunt-ended but sharp-edged shape by using sanding strokes perpendicular to the centerline of the lead. Holding the end of the pencil lead firmly against the enamel test panel, with the pencil centerline at an angle of 45° with the painted surface, apply four gouging or scraping strokes to the enameled surface. The strokes shall be a minimum of \( \frac{1}{4} \) in. (6.4 mm) long and applied forward, trying to gouge the lead into the enameled surface. The enamel surface shall remain undamaged when subjected to this test.

9.2.3.4 Paint Cure—The solvent cure test determines if the enamel finish is properly cured. Conduct the test as follows: Wrap finger in a rag and dip in a solvent recommended by the manufacturer of the touch-up enamel, one or more coats as required. Wipe surface clean of dust or moisture.

9.2.3.5 Adhesion—Evaluate adhesion between enamel and prime coat and between prime coat and steel substrate by a cross-hatch test in accordance with Test Methods D 3359 and as follows: Scribe the enameled test panel with a sharp knife or similar instrument to give a cross hatch pattern with overall size of 1 in.\(^2\) (6.45 cm\(^2\)). Make 17 parallel cuts at about 1⁄16 in. (2 mm) spacing and extending through the coating to the base metal. Make 17 similar cuts at 90° to and crossing the first 17, giving a cross-hatched area of 256 squares. Press masking tape 1 in. (25 mm) wide firmly onto the entire hatched area and then immediately jerk cleanly away from the panel. Examine the hatched area. Normally, no paint squares will belifted by this test, but a classification of 3B, in accordance with Test Methods D 3359, for one panel out of three is permissible.

9.2.3.6 Flexibility—Test the enameled metal test panel for flexibility of the paint system by bending 180° over a conical mandrel in accordance with Test Method D 522. The paint system shall not flake or exhibit loss of adhesion during this test. Slight cracking of paint finish, less than \( \frac{1}{4} \) in. (6.4 mm) long, at conical mandrel diameters less than \( \frac{1}{2} \) in. (12.7 mm) is permissible.

9.2.3.7 Impact Resistance —The enameled metal test panel shall withstand a minimum of 40 in. lb (4.52 J) direct impact without cracking or loss of adhesion. The impact test consists essentially of a 2 lb (0.91 kg) bar dropping 20 in. (508 mm) onto a \( \frac{1}{2} \) in. (12.7 mm) diameter sphere in contact with the test panel. The surface of the test equipment beneath the test panel shall have a circular, concave surface greater than \( \frac{1}{2} \) in. in diameter directly under the point of contact.

9.2.3.8 Color Stability—The enameled metal test panel, when subjected to an additional bake of 350°F (177°C) for 30 min, shall show no significant change in color or gloss.

9.2.4 Air Dry Touch-Up Enamel:

9.2.4.1 Conditions for Use—This air dry touch-up enamel is intended for use in the field for minor scratches or defects only. It shall be compatible with, and adhere to, the scratched surface.

9.2.4.2 Preparation of Scratched Surface—Where appearance is important, use fine sandpaper and taper edges of scratch to blend in and conceal scratch before applying touch-up enamel. Wipe surface clean of dust or moisture.

9.2.4.3 Application—Apply by brush, roller, or spray, as recommended by the manufacturer of the touch-up enamel, one or more coats as required.

9.2.4.4 Color—Color must match the color of the scratched surface.

9.2.4.5 Gloss—Gloss must match the gloss of the scratched surface. The gloss shall be as follows, when measured with a 60° glossmeter:

- Furniture and metal joiner work: 25 to 35
- Ceiling panels: 6 to 16

9.2.4.6 Curing Rate—Cure this touch-up enamel as follows:

- Dust free: 30 min
- Dry enough to handle: 1–2 h
- Dry enough to sand and recoat: 24 h

10. Quality Assurance

10.1 Daily Test Panels—(NOTE):

10.1.1 Prepare four test panels of each of the following three metals daily: USSG 20 gage (0.0359 in. or 0.91 mm) thick cold-rolled carbon steel in accordance with Specification A 1008, GSG 20 gage (0.0396 in. or 1.01 mm) thick galvannealed steel in accordance with Specification A 653/A 653M with coating designation A 01, and 0.040 in. (1.02 mm) thick type 5052–H32 aluminum alloy in accordance with Specification B 209. Test the enameled panels of each metal as follows and record the results (see Fig. X1.1).

**Note:** This specification is intended for use on steel, galvanized steel and aluminum furniture and joiner work. Even if the product is basically all aluminum, such as for U.S. Navy furniture, it may contain parts of galvanized steel and painted steel. By daily testing all three metals all possibilities are covered.

10.1.1.1 Dry Film Thickness—See 9.2.1.
10.1.1.2 Hardness—See 9.2.2.3.
10.1.1.3 Paint Cure—See 9.2.3.4.
10.1.1.4 Adhesion—See 9.2.3.5.
10.1.1.5 Flexibility—See 9.2.3.6.
10.1.1.6 *Impact Resistance*—See 9.2.3.7. Test the remaining set of prime coated only panels in salt spray in accordance with 9.2.2.1 and 9.2.2.2, evaluate them in accordance with 9.2.2.3 and 9.2.2.4, and report results on the form shown in Fig. X1.1.

10.1.2 Maintain and retain copies of these daily tests and their results for historical documentation in accordance with 10.3. See Fig. X1.2 for a sample of a suitable record-keeping form.

10.1.3 See 10.4 for test panel retention requirements.

10.2 Perform in-process tests for color match, gloss, paint cure, and film thickness, on the finished product, for each color change or at least once each hour on large color runs.

10.2.1 Maintain and retain copies of these tests and results for historical documentation in accordance with 10.3. See Fig. X2.1 for sample of a suitable record-keeping form.

10.3 Retain process control records and paint test panel results for as long as is required by the procurement documents. If not addressed in these procurement documents, retain all process control records and paint test panel results only until the product has been accepted by the procuring agency and payment has been made to the product supplier.

10.4 Normally, test panels shall be retained for a period of one month but may be discarded sooner if inspected and test results are recorded on the appropriate test results form by a cognizant inspector.

10.5 Maintain an inspection of the final product for adequate paint coverage and proper appearance to produce a quality product. See Appendix X2.

**APPENDIXES**

*(Nonmandatory Information)*

**X1. LAB TECHNICIAN**

X1.1 Perform tests on cleaning, pretreatment, and electrodeposition systems and maintain at proper operating ranges.

X1.2 *Paint Sample Tests:*

X1.2.1 Run (four) sample panels each of mild steel, aluminum, and galvanealed steel sheet each day as follows:

X1.2.1.1 Two of each material to be prime-coat only, and

X1.2.1.2 Two of each material to be top-coated over prime.

X1.2.2 Test top-coated panels and one set of prime-coated only panels as follows and record the results on the Lab Technician—Paint Sample Quality Assurance Tests Form (Fig. X1.1).

X1.2.2.1 Film thickness.

X1.2.2.2 Hardness.

X1.2.2.3 Paint cure.

X1.2.2.4 Adhesion.

X1.2.2.5 Flexibility.

X1.2.2.6 Impact resistance.

X1.2.3 Test the remaining set of prime-coated samples in salt spray and record the results on the Salt Spray Data Form (Fig. X1.2).

FIG. X1.1 Lab Technician—Paint Sample Quality Assurance Tests Form
X2. FINAL PRODUCTION PRODUCT INSPECTION

X2.1 The following quality assurance checks are to be made at least once every hour on large color runs or on each color change. Record results on the Paint Shop Production Line, Quality Assurance Check List Form Fig. X2.1).

X2.1.1 Color match.
X2.1.2 Gloss.

X2.1.3 Paint cure.
X2.1.4 Dry film thickness.

X2.2 The following quality assurance checks are to be made on each item as it is removed from the paint line.

X2.2.1 Paint coverage.
X2.2.2 Appearance:

X2.2.2.1 Runs.
X2.2.2.2 Blisters.
X2.2.2.3 Bumped or dented material requiring filling.

X3. PAINT SAMPLE QUALITY ASSURANCE SALT SPRAY TESTS

X3.1 Samples—One sample panel each of mild steel, aluminum, and galvanized steel sheet that have been enameled shall be tested each production day.

X3.1.1 Panels must be checked for dry film thickness and scribed through the paint coat to expose the underlaying metal before testing.

X3.2 Testing—Test panels shall be continuously tested in accordance with Practice B 117.

X3.2.1 Panels shall be tested for 250, 500, 750, and 1000 h, with results at each interval recorded on the Salt Spray Data Form (Fig. X1.2).

X3.3 Records—Copies of Salt Spray Data Form (Fig. X1.2) showing tests results must be forwarded to Quality Assurance and the plant manager for evaluation.

X3.3.1 Quality Assurance will maintain a reference file on all daily salt spray test results. (See 10.3.)
X3.3.2 After test results have been recorded and any failures evaluated by Quality Assurance, test panels may be discarded.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org).
Standard Practice for
Inspection Procedure for Use of Anaerobic Thread Locking Compounds with Studs

This standard is issued under the fixed designation F 1179; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers an inspection procedure to ensure that studs installed with an anaerobic thread locking compound have achieved the necessary backout resistance.

1.2 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. General Requirements

2.1 Application of anaerobic compounds, used as a method for locking threaded fasteners, shall be in accordance with the anaerobic compound manufacturer’s recommendations.

2.2 Responsibility for Inspection—Unless otherwise specified in the contract, the contractor is responsible for the performance of all inspection requirements as specified herein.

2.3 Government Inspection System—For U.S. Navy procurements, each organization shall maintain an inspection system to ensure that all of the requirements of this practice are being met wherever anaerobic compounds are used for locking threaded fasteners.

3. Stud Installation Verification

3.1 Verification of fastener locking effectiveness of anaerobic compounds, after the manufacturer’s recommended setting period, shall be in accordance with the following:

3.1.1 Witness installation and removal through a distance of three threads beyond the locking element of a previously unused nut (annular plastic ring locking element type) on two studs in each joint bolt circle containing more than three studs.

3.1.1.1 Locate selected studs 180° apart or as close thereto as possible.

3.1.1.2 Examine only one stud in applications having three studs or less.

3.1.2 Accept the assembly if no turning motion of the studs is observed during nut installation or removal. Also, accept the assembly if a slight initial turning motion (up to ¼ turn) of the studs is observed, and no further turning motion of the studs is observed, during nut installation or removal. A small initial turning of the set stud represents a breaking or powdering of the locking compound which actually increases resistance to any further turning motion.

3.1.2.1 Do not restrain studs from turning during the test by any method other than the locking compound in the set end of the stud.

3.1.3 Reject each stud assembly if the requirements for acceptance of 3.1.2 are not met. If one assembly is rejected, all studs in that bolt circle shall be similarly checked (see 3.1.1 and 3.1.2). Remove and clean all rejected studs in accordance with the manufacturer’s recommended procedures, reinstall, and reinspect.

3.1.3.1 Reinspection shall consist of selecting two of the reinstalled studs, if four or more studs require reinstallation, or one stud if less than four studs require reinstallation, and performing procedures 3.1.1, 3.1.2, and 3.1.3.

3.1.4 If assembly is accepted after step 3.1.2, each stud in the bolt circle shall be permanently marked (scribe or electro-etched) on the exposed end with a line oriented radially in relation to the center of the bolt circle.

4. Joint Assembly Inspection

4.1 Joint assembly shall be completed and final torque applied:

4.1.1 Note the position of the orientation line (see 3.1.4) on the studs. If the orientation line position indicates that studs have not turned more than ¼ turn, accept the joint assembly.

4.1.2 If the orientation line position indicates one or more studs have turned more than ¼ turn, reject the joint, disassemble the joint, and remove and clean the studs which failed in accordance with the manufacturer’s recommended procedures, reinstall, and reinspect.

4.1.3 Reinspection of the stud shall consist of procedures 3.1.1, 3.1.2, and 3.1.3.

4.1.4 Reinspection of the joint assembly shall consist of procedures 4.1.1 and 4.1.2.

4.1.5 Repeat the removal and reinstallation procedure until the orientation line shows that studs have not turned more than ¼ turn during the final torquing.
5. Keywords

5.1 anaerobic compound; inspection; locking threaded fastener
Standard Specification for Anodes, Sacrificial Zinc Alloy

This standard is issued under the fixed designation F 1182; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (¢) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the requirements for zinc anodes in the form of slabs, plates, discs, and rods for corrosion protection (cathodic protection) of metals and alloys.

1.2 The anodes are primarily intended to reduce corrosion of surface ship and submarine hulls, steel and aluminum equipment and structures, sea chests, sonar domes, and the seawater side of condensers and other heat exchangers.

1.3 The values stated in inch-pound units are to be regarded as standard. The metric (SI) units, given in parentheses, are for information purposes only and may be approximate.

1.4 This standard does not purport to address the safety concerns associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 Order of Precedence—In the event of a conflict between the text of this specification and the references cited herein, the text of this specification shall take precedence.

2.2 ASTM Standards
A 36/A36M Specification for Carbon Structural Steel
B 21 Specification for Naval Brass Rod, Bar, and Shapes
B 103 Specification for Phosphor Bronze Plate, Sheet, Strip, and Rolled Bar
D 3951 Practice for Commercial Packaging
E 290 Test Method for Semi-Guided Bend Test for Ductility of Metallic Materials
E 536 Test Method for Chemical Analysis of Zinc and Zinc Alloys

2.3 Military Standards:

MIL-STD-105 Sampling Procedures and Tables for Inspection by Attributes
MIL-STD-129 Marking for Shipment and Storage
MIL-STD-1186 Cushioning, Anchoring, Bracing, Blocking, and Waterproofing; With Appropriate Test Methods

2.4 Military Specification:

MIL-P-15011 Pallets Material Handling, Wood Post Construction, 4-Way Entry

2.5 Federal Specifications:

PPP-B-601 Boxes, Wood, Cleated Plywood
PPP-B-621 Boxes, Wood, Nailed and Lock-Corner
PPP-B-636 Boxes, Shipping, Fiberboard

2.6 American National Standards Institute Standard:

ANSI/ASME B1.20.1—Pipe Threads, General Purpose (Inch)

3. Classification

3.1 The anodes shall be of the following classes and types, as specified (see 4.1.2):

3.1.1 Class 1—Cast-in cores:

3.1.1.1 Type ZHS—Zinc, hull slab, steel straps, 23 and 42-lb (10 and 19-kg) sizes.

3.1.1.2 Type ZHB—Zinc, hull slab, brass straps, 23-lb (10-kg) size.

3.1.1.3 Type ZHC—Zinc, hull slab, core strap, 23 and 42-lb (10 and 19-kg) sizes.

3.1.1.4 Type ZSS—Zinc, submarine slab, steel strap, 12 and 24-lb (5 and 11-kg) sizes.

3.1.1.5 Type ZTS—Zinc, teardrop shape, steel strap, 5-lb (2-kg) size.

3.1.1.6 Type ZEP—Zinc, heat exchanger or fair water disc, (pipe core or pipe bushing core):

Style A square slab, 9-lb (4-kg) size
Style B circular slab, various sizes
Style C semicircular slab, 23-lb (10-kg) size

3.1.1.7 Type ZBP—Zinc, bar, pipe core, 8-lb (4-kg) size.

3.1.1.8 Type ZDM—Zinc, segmented disc, machine formed interlocking core, various sizes.

3.1.2 Class 2—Plain, no cores;
3.1.2.1 Type ZRN—Zinc, rod, no core, extruded, drawn or rolled.

3.1.2.2 Type ZPN—Zinc, plate, no core, rolled.

3.2 The letter designations of types of anodes have the following meanings:

3.2.1 The first letter designates anode metal:
- Z zinc

3.2.2 The second letter designates the shape or general use:
- H hull slab
- S submarine slab
- T teardrop shape
- E heat exchanger slab
- R rod, cylindrical
- P plate
- B bar, square
- D disc, segmented

3.2.3 The third letter designates the core:
- B brass straps
- S steel straps
- C core strap
- P pipe core
- M machine formed interlocking core
- N no core

4. Ordering Information

4.1 Orders for material under this specification shall include the following information:

4.1.1 ASTM designation and year of issue,

4.1.2 Class and type (see 3.1),

4.1.3 Style of Type ZEP, if required (see 3.1.1.6 and Fig. 1),

4.1.4 Diameter of Type ZEP, Style B, if required (see Fig. 1),

4.1.5 For Type ZDM, whether straight or tapered thread support plug head is required (see section 5.1.4.2),

4.1.6 Diameter of Type ZDM, if required (see Fig. 2),
4.1.7 Length, width, and thickness of Type ZHS, if required (see Fig. 3 and Fig. 4),

4.1.8 Whether Type ZHC is for surface ship or submarine usage, if required (see Figs. 5-8),

4.1.9 Pipe or bolt diameter of Type ZRN, if required (see Fig. 9),

4.1.10 Thickness of Type ZPN, if required (see 9.2.1),
4.1.11 Quantity required (see 4.2),

4.1.12 Quality assurance certification, if required (see 15.1),

4.1.13 Optional requirements, if any (see S1 through S3).

4.2 The order for anodes should specify the exact number of anodes required (see 4.1.11). Acquisition of anodes by weight is not practical and is not recommended.

5. Materials and Manufacture

5.1 Materials:

5.1.1 Types ZHS, ZHC, ZSS, and ZTS anodes shall have steel strap cores in accordance with Specification A 36/A36M. The steel shall be coated with zinc, either by the hot-dip or electrodeposition method, to a minimum of 0.0005 in. (0.013 mm).

5.1.2 Type ZHB anodes shall have brass strap cores in accordance with alloy 482 of Specification B 21 or phosphor bronze straps in accordance with C51000 of Specification B 103. The brass or bronze straps shall be coated with zinc to a minimum thickness of 0.0005 in. (0.013 mm). Lack of adhesion of the zinc coating at bend or absence of zinc coating at cut edges will not be cause for rejection of fabricated anodes. Cracks in the base metal shall be cause for rejection.

5.1.2.1 The maximum copper content in the zinc, as specified in Table 1, may be increased to 0.020 % for Type ZHB anodes.

5.1.3 Types ZEP and ZBP anodes shall have core inserts made from zinc coated steel pipe or pipe couplings. The minimum thickness of the coating shall be as specified in 5.1.1.

5.1.4 Type ZDM anodes shall have machine formed interlocking cores in accordance with commercial grade mild or leaded steel. The cores shall be flash coated with zinc, tin, or aluminum before assembly within the anodes.

5.1.4.1 This core insert consists of an integral piece having a threaded male stud at one end and a tapped hole at the other.
end. Provision has been made to achieve self-locking characteristics to interlocking threaded assemblies of multiple segmented anode discs by interference fit of bottom male threads into a taper tapped hole.

5.2 Manufacture:

5.2.1 All anodes covered under this specification shall be manufactured by any process suitable to the contracting agency provided they meet the mechanical properties and other requirements of this specification.

5.2.2 For Types ZHS, ZHB, ZHC, ZSS, and ZTS anodes, open or closed molds may be used. Cores and straps shall be positioned so that they are embedded $\frac{1}{4}, +\frac{1}{8},$ or $-\frac{1}{16}$ in. (6, +3, or −2 mm) as shown on Figs. 3-5, Fig. 7, and Fig. 10 and Fig. 11, which may be measured from either surface of the anode as applicable, except Fig. 11 (bottom), which shall be embedded $\frac{3}{8}, +\frac{1}{8},$ or $-\frac{1}{16}$ in. (10, +3, or −2 mm).

5.2.2.1 Type ZHC anodes designated as shown on Fig. 6 and Fig. 8 and are intended for use with rubber washers for submarine application. The countersink for the rubber washer may be cast or machined. The anode shall be manufactured so that the countersink is centered on the core hole and the rubber washer fits snugly between the hull and anode core to prevent anode movement or vibration.

5.2.2.2 Type ZSS, ZHS, ZHB, and ZTS anodes may be mounted by welding or by fasteners. Those intended to be attached by fasteners shall indicate the requirements for mounting holes in the strap. The mounting hole shall be counterbored on the structure side of the strap.

5.2.3 The pipe core inserts for Type ZEP anodes shall conform to 5.1.3. The position of the pipe core insert shall not vary more than $\pm \frac{1}{8}$ in. (3 mm) from the center as shown on Fig. 1.

5.2.5 Metallic bonding or an interference fit of the core into Type ZDM anode (see Fig. 2) shall be required so that an axial force applied from the stud end to remove the core insert is a minimum of 750 lb (340 kg) (see 13.1.3).  

5.2.6 The machine formed core insert specified in 5.1.4 shall be manufactured in accordance with details and tolerances shown for Piece 2 on Fig. 1 and ANSI/ASME B1.20.1. 

5.2.6.1 The pieces shown on Fig. 1 shall screw together very snugly by hand tightening or by using simple hand tools such as pliers or pipe wrenches.
6. Chemical Composition

6.1 The anodes shall conform to the composition specified in Table 1. Total of elemental constituents not specified in Table 1 shall not exceed 0.10%. Metallic elements not specified in Table 1 are considered contaminants.

7. Mechanical Properties

7.1 When tested in accordance with 13.2, Types ZRN rods and ZPN plates shall not fracture or show signs of cracking.

7.2 When tested in accordance with 13.2.1, ZRN anodes shall have a minimum torsional shear strength of 12 000 psi (83 MPa).

8. Other Requirements

8.1 When tested in accordance with 13.1.1 or 13.1.2, Types ZHS, ZHB, ZHC, ZSS, ZTS, ZEP, and ZBP anodes shall obtain a sound metallurgical bond between the zinc and core for at least 30% of the total surface area of each core in contact with the anode.

8.2 During the manufacturing process, certain toxic compounds (such as zinc phosphide) may become by-products. Caution should be taken in disposal of process wastewater to ensure that the composition of the water meets with local, state, and federal regulations.

9.1 Types ZHS, ZHB, ZHC, ZTS, ZSS, ZEP, ZBP, ZDM, and ZRN anodes shall be in accordance with the dimensions shown in Figs. 1-11, inclusive.

Note 1—Anode may be cast with exposed face in the up or down position. All dimensions are in inches.

Note 2—Tolerance ± 1/8 in.

Note 3—1 in. = 25.4 mm.

Note 4—Minimum weight 21.5 lb (9.7 kg).

FIG. 5 Zinc Hull Slab (Core Strap), Type ZHC-23

Note 1—Anode may be cast with exposed face in the up or down position. All dimensions are in inches.

Note 2—Tolerance ± 1/8 in.

Note 3—1 in. = 25.4 mm.

Note 4—Minimum weight 21.5 lb (9.7 kg).

FIG. 6 Zinc Hull Slab (Core Strap), Type ZHC-23, Submarine Application

9.2 Type ZPN anode shall be 48 in. (1220 mm) in length by 24 in. (610 cm) in width.

9.2.1 The thickness shall be either 1/2 or 1 in. (13 or 25 mm) as specified (see 4.1.10).

9.3 Types ZSS-12, ZSS-24, ZHC-23, ZHC-42, ZHS-23, and ZHS-42 shall have the following minimum weight requirements:

<table>
<thead>
<tr>
<th>Anode</th>
<th>Weight, min, lb (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZSS-12</td>
<td>11.0 (5)</td>
</tr>
<tr>
<td>ZSS-24, ZHC-23, ZHS-23</td>
<td>21.5 (10)</td>
</tr>
<tr>
<td>ZHC-42</td>
<td>39.0 (18)</td>
</tr>
<tr>
<td>ZHS-42</td>
<td>41.0 (19)</td>
</tr>
</tbody>
</table>

9.3.1 The total weight of the specified type of anode received divided by the total number of anodes of that type shall be equal to or greater than the minimum weight (11.0, 21.5, 39.0, 41.0 lb (5, 10, 18, 19 kg)) of the anode type specified. If the weight is less than the minimum weight for the type of anode specified, it shall be cause for rejection of the entire lot.
9.4 The length and width of Types ZHS, ZHB, ZHC, ZTS, ZPN, ZSS, and ZBP anodes shall not vary more than \( \frac{1}{8} \) in. (3 mm), measured at the widest surface of the tapered (for mold release) anode.

9.5 The length of Type ZRN anodes will be permitted to have a variation of \( \pm \frac{1}{32} \) in. based on nominal lengths of 3 and 6 ft (914 and 1829 mm).

9.6 The diameter or width, whichever is the larger, of Type ZEP anodes shall not vary from the specified dimension by more than \( \frac{1}{8} \) in. (3 mm).

9.7 The diameter of Type ZDM anodes shall not vary more than \( \pm 0.005 \) in. (0.13 mm) from the specified diameter.

9.8 The diameter of the ZRN anode shall not vary more than \( \pm \frac{1}{2} \) in. (1 mm) from the specified diameter.

9.9 The thickness of Types ZHS, ZHB, ZHC, ZTS, ZPN, ZSS, ZEP, and ZBP anodes shall not vary more than \( \pm \frac{1}{8} \) in. (3 mm). Thickness measurements shall be taken at random 1 in. (25 mm) from any edge of the anode by means of a suitable caliper avoiding any surface irregularities which would interfere with a representative measurement.

9.10 The thickness of Type ZDN anodes shall not vary more than \( \pm \frac{1}{64} \) in. (0.4 mm).

9.10.1 The cores of Type ZDM anodes shall be positioned axially and concentrically in the zinc disc. Eccentricity greater than 0.005 in. (0.13 mm) will not be permitted.

10. Workmanship, Finish, and Appearance

10.1 The zinc anodes shall be free of flash burrs, cracks, blow holes, pipes, and surface slag consistent with good commercial practice.

10.1.1 For anodes less than 2 in. (50 mm) thick, when measured with a straightedge placed diagonally across the opposite edges of the cast anode, the anode shall be free of shrinkage cavities exceeding \( \frac{1}{4} \) in. (6 mm) in depth. Anodes 2 in. (50 mm) thick or more shall be free of shrinkage cavities exceeding \( \frac{3}{8} \) in. (10 mm) in depth.

10.1.1.1 For Type ZPN anodes, shrinkage cavities shall be measured over a 12- by 12-in. (305- by 305-mm) area and shall not exceed the dimensions specified in 10.1.1.

10.1.2 Surface irregularities of the anode exceeding \( \frac{1}{8} \) in. (3 mm) in depth shall not be permitted on either face of slab or disc type anodes unless at least \( \frac{1}{8} \) in. (3 mm) of sound metal covers the entire strap of core area.

10.2 Types ZDM and ZRN anodes shall be smooth on their curved surfaces.

10.3 Metal core extensions from the anodes shall be smooth and free of sharp burrs. The cast-in cores shall have metallurgical bonds specified herein free of air pockets and inclusions consistent with good commercial practice.

10.4 The coatings specified in 5.1.1 shall be adherent and free from flaking. The coating shall adhere tenaciously to the surface of the base metal. When the coating is cut or pried into,
such as with a stout knife applied with considerable pressure in a manner tending to remove a portion of the coating, it shall only be possible to remove small particles of the coating by paring or whittling, and it shall not be possible to peel any portion of the coating so as to expose the steel. Lack of adhesion of the zinc coating at bends or absence of zinc coating at cut edges shall not be cause for rejection of fabricated anodes.

11. Sampling

11.1 For the purposes of sampling, a lot shall consist of all zinc anodes of the same class and type, poured or cast from one homogeneous heat or melt of a single charge of raw materials. The addition of any material to the heat or melt at any time constitutes a new lot.

11.2 Select a random sample of anodes from each lot in accordance with MIL-STD-105 at Inspection Level II for the examination specified in 14.1. In terms of defects per 100 units, the acceptable quality level (AQL) shall be 4.0 for total defects.

11.3 From each lot specified in 11.1, select two anodes at random of Types ZHS, ZHB, ZHC, ZSS, ZTS, ZEP, and ZBP and five anode discs of Type ZDM for the core bond tests specified in 13.1.1 or 13.1.2.

11.3.1 In cases in which one of the two anodes specified in 13.1.1 or 13.1.2 fails to pass the bond test, select four additional anodes for retest at the request of the manufacturer.

11.4 Select at random from the lot at least five each of both Type ZRN and ZPN anodes for the sampling for the physical testing described in 13.2.

11.5 The sampling for the chemical analysis described in 13.3 shall consist of anodes being selected at random in...
accordance with 11.3, except that sufficient number of Type ZDM anodes shall be selected to comply with 12.1.5.

11.6 Discard sample anodes, except the remaining lengths of Type ZRN anodes, and do not include them in the delivery of material after the core bond tests specified in 13.1.1 and 13.1.2 are performed. Perform sampling for chemical analysis specified in 11.5 before discarding the anodes.

12. Specimen Preparation

12.1 From each anode selected for chemical analysis in accordance with 11.5, take one 2-oz (0.06-kg) sample by drilling or machining the material at the locations specified in 12.1.1-12.1.6, inclusive. The drilling or machining shall be done by the contractor. The drill or tool bit shall not penetrate into the core material of the cored type anodes. The drilled or machined anodes may be included in the delivery of the material, except Type ZDM anode, which shall be discarded.

12.1.1 Drill or machine Types ZHS and ZHB anodes at locations about 2 to 5 in. (50 to 127 mm) from the short edge as appropriate to keep away from the encased core.

12.1.2 Drill or machine Types ZSS, ZHC, and ZTS anodes at points not greater than 1/2 in. (13 mm) from the long edge.

12.1.3 Drill Types ZEP and ZBP anodes at points midway between the outer edge of the core and the edge of the anode.

12.1.4 Drill Types ZRN and ZPN and have two 1-lb (0.45-kg) minimum sections cut from ends of a nominal length.

12.1.5 Type ZDM anodes shall have a sufficient number of discs machined or drilled at the outer surface to make two 4-oz (0.11-kg) quantities and shall be machined or drilled at the outer surface to a depth not exceeding 1/4 in. (6 mm).

12.1.6 Take one 2-oz (0.06-kg) sample for each anode specified in 12.1 at the surface in contact with mold wall by drilling or machining to a maximum of 1/4 in. (6 mm). Take the sample for Types ZPN or ZRN by drilling completely through both principal surfaces or through the diameter of the anode as applicable. Collect the samples in individual clean containers and properly label as to lot, melt, and sample numbers. Sample chips may be taken from anodes which have passed the applicable bond tests. Samples shall be clean, free from dirt, oil, grit, and foreign matter. Test the samples at a laboratory satisfactory to the contracting agency.

12.2 The drilling of samples for chemical analysis should be made with a special nonferrous drill in a clean location (used only for that purpose). Keep the drilling bits clean of dirt, grit, and other foreign matter; keep them properly sharpened; and use them only for sampling purposes. After each use, immerse the drilling bit in a degreasing solvent and wipe dry with a clean rag. Store the drilling bits, when not in use, in an
inhibited lubricating oil. Keep this oil in a covered glass container provided with an air vent. Wipe the drilling bits dry with a clean rag prior to use. Take the samples with a dry drill. If automatic power drilling is available, a solid tungsten carbide drill bit about ½ in. (13 mm) in diameter is suitable. Where a hand-held power drill is used, the drill bit should be
about ¼ in. (6 mm) in diameter. A smaller drill bit may be used where the size of the anode does not permit using the specified diameters. The drills may be used at high speeds and feeds.

12.3 Make the chips for chemical analysis with a special nonferrous tool in a place which has been cleaned for that specific purpose. Instructions specified in 12.2 apply to the use and care of this tool.

12.4 Use a strong magnet to remove any iron contamination picked up during the preparation of the chips. Wash the chips in an iron-free degreasing solvent prior to the chemical analysis.

13. Test Methods

13.1 Perform one of the following core bonding tests on Types ZHS, ZHB, ZHC, ZSS, ZTS, ZEP, and ZBP anodes.

13.1.1 Core bonding test—Cut each anode selected to represent the lot along the axis of each strap or core, and ground the cut surface reasonably smooth. Polish these surfaces with a 240-mesh emery abrasive until the zinc-strap interface is distinctly visible. Examine this interface carefully at approximately 10 times magnification. The metallurgical bond between the zinc and the strap shall be continuous for at least 30 % of the surface in contact with the anode. Zinc anodes may have a bead or buttress projecting from the anode edge along the strap not exceeding ¼ in. (6 mm). Less bond between the core and the zinc than specified herein shall be cause for rejection of the entire lot.

13.1.2 Alternate Core Bonding Test—Using any suitable method, tear the cores from each anode selected to represent the lot. The use of a sledge hammer to break the zinc away from the cores has been found to be satisfactory. Establish the area showing bond by visual inspection of the portion of the cores which were contained within the anode. Metallurgical bond between the zinc and the core shall be continuous for at least 30 % of the total surface area of each core in contact with the zinc of the anode. For the purpose of determining the surface area of the encased core in the anode, marks shall be scribed on the strap around the periphery of each anode at locations where the straps protrude from the anode. The total area of the strap shall be computed between the scribe marks. The surfaces shall have a smooth grey matte finish where bonding has been adequate and either a shiny metallic or rough, dark, or discolored finish where bonding has been inadequate. Examine both core and zinc mating surfaces. Less bond between core and zinc than that specified herein shall be cause for rejection of the entire lot.

13.1.3 A steady load of 750 lb (340 kg) from a hand operated pen press applied axially shall be required to remove the core from Type ZDM anode.

13.2 Types ZRN and ZPN anodes, selected in accordance with 11.4, shall be bent 45° around a mandrel of three times the diameter of the ZRN type anode and three times the thickness of the ZPN plate. Bend the anodes in accordance with procedures specified in Test Method E 290. After bending, inspect the convex surface of the specimens for cracking by visual examination. Any evidence of cracking shall represent failure of the test and shall be cause for rejection of the entire lot.

13.2.1 Subject the ZRN anodes specified in 13.2 to torsional shear at a rate of ten to twelve revolutions per hour using a torsional shear apparatus. Failure of the anode to withstand a torsional shear of 12,000 psi (83 MPa) shall be cause for rejection of the lot.

13.3 Analyze the chips selected in accordance with 11.5 to determine conformance with 6.1. If any sample does not conform to the chemical composition specified in Table 1, it shall be cause for rejection of the lot represented by the sample.

13.3.1 Determine the aluminum, cadmium, copper, iron, and lead content of zinc in accordance with the appropriate methods in Test Method E 536 using the atomic absorption spectrophotometer.

13.3.2 A spectrochemical analysis shall be in accordance with any applicable ASTM standard method and accepted by the purchaser.

14. Inspection

14.1 Each anode selected in accordance with 11.2 shall be visually examined for workmanship and dimensions. Where the number of anodes that do not conform to the requirements of Sections 7, 9, 10, and 16 is equal to or greater than the rejection number specified in 11.2 (AQL = 4.0), it shall be cause for rejection of the entire lot.

15. Certification

15.1 When specified in the contract or purchase order (see 4.1.12), a manufacturer’s or supplier’s certification shall be furnished to the purchaser stating that samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When specified in the contract or purchase order, a report of the test results shall be furnished.

16. Product Marking

16.1 The zinc anodes, Types ZHS, ZHB, ZHC, ZSS, and ZBP, shall have the words “DO NOT PAINT” die-stamped or cast on the exposed face of the anodes (see Fig. 3, Fig. 4, Fig. 7, Fig. 11, and Fig. 12). These words are not required on Types ZEP, ZPN, ZDM, ZTS, and ZRN zinc anodes.

16.1.1 One end of each cast-in strap of each Type ZHB anode shall be painted red so that the installing activity can distinguish it from Type ZHS anodes. One coat of red paint shall be applied between the joggled bevel of the strap and zinc anode. The coating shall be approximately ¼ in. (13 mm) wide and shall extend across one side of each strap so as to be readily visible when the anode is installed. The foot of the strap shall not be painted.

16.2 All anodes shall be cast, die-stamped, or scribed with the following: manufacturer’s symbol, unique non-recurring heat number, and numbers and letters corresponding to this ASTM specification (including revision designation).

17. Packaging

17.1 Unless otherwise specified (see 4.1.13), packaging shall conform to manufacturer’s normal commercial practice, and in such a manner that will ensure acceptance by common carrier and afford protection against physical and mechanical
damage during shipment. Shipping containers shall conform to carrier regulations as applicable to the mode of transportation.

18. Keywords
18.1 anodes; disc anodes; plate anodes; rod anodes; sacrificial anodes; slab anodes; zinc alloy anodes

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply for government contracts or when specified by the purchaser in the contract or purchase order (see 4.1.13).

S1. Referenced Documents
S1.1 The following documents are applicable only when one or more of the requirements of S2 are specified in the contract or purchase order (see 4.1.13): Practice D 3951; MIL-P-15011; MIL-STD-129; MIL-STD-1186; and Fed. Specs. PPP-B-601, PPP-B-621, and PPP-B-636.

S2. Packaging and Package Marking
S2.1 Preservation shall be Level A, C, or commercial, as specified (see 4.1.13).
S2.1.1 Level A—Type ZEP, Styles A and B (2- to 6-in. (51-to 152-mm) diameter, inclusive) and Type ZDM anodes shall be packaged in quantities specified in Table S1.1, unless otherwise specified (see 4.1.13), and snugly fitted into fiberboard boxes in accordance with Federal Specification PPP-B-636, class water resistant. ZEP anodes shall be immobilized within the boxes with solid fiberboard or other suitable separators so that cast-in cores cannot be loosened by impact or heavy loading. The gross weight of the boxes shall not exceed the weight limitations of the fiber box specifications.
S2.1.2 Level C—The zinc anodes shall be preserved as specified for Level A, except that nonweather resistant domestic grade fiberboard boxes may be used.
S2.1.3 Commercial—Anodes shall be preserved in accordance with Practice D 3951.
S2.2 Packing shall be Level A, B, or commercial, as specified (see 4.1.13).
S2.2.1 Level A—Anodes, segregated for type, size, and heat, shall be packed in accordance with S2.2.1.1 through S2.2.1.6.
S2.2.1.1 Types ZHS, ZHB, ZHC, ZTS, ZPN, ZSS, ZBP, and ZEP (Style B in sizes 9- and 11-in. (229- and 279-mm) diameter and Style C) anodes shall be packed in unit pallet loads or in boxes in accordance with S2.2.1.2 and S2.2.1.3.
S2.2.1.2 Pallets shall be in accordance with MIL-P-15011. The anodes shall be secured to the pallet with tension tied, coated or galvanized, steel strapping applied lengthwise and girth-wise. Minimum size of the strapping shall be 0.075 by 0.035 in. (20 by 10 mm). The gross weight of the pallet load shall not exceed 3000 lb (1362 kg).
S2.2.1.3 The boxes shall be in accordance with Federal Specifications PPP-B-601 (overseas type) or PPP-B-621, Class 2. The gross weight of the box shall not exceed approximately 500 lb (227 kg). Box closure and strapping shall be in accordance with the applicable box specification or appendix thereto. The boxes shall be modified by the addition of skids, for gross weights exceeding 200 lb (91 kg), in accordance with the applicable box specification.
S2.2.1.4 Types ZEP, Style A and B in sizes 2- to 6-in. (51-to 152-mm) diameter inclusive, and ZDM anodes packaged as specified in S2.1.1, shall be packed and snugly fitted into nailed wood or wood-cleated plywood boxes in accordance with Federal Specifications PPP-B-621, Class 2, or PPP-B-601 (overseas type), respectively. The gross weight of shipping containers shall not exceed approximately 200 lb (91 kg).
S2.2.1.5 Type ZRN anodes shall be packed as specified in S2.2.1.3.
S2.2.1.6 The anodes shall be cushioned, blocked, and braced in accordance with MIL-STD-1186.
S2.2.2 Level B—Anodes, segregated for type, size, and heat, shall be packed in accordance with S2.2.2.1 through S2.2.2.6.
S2.2.2.1 Types ZHS, ZHB, ZHC, ZTS, ZPN, ZSS, ZBP, and ZEP (Style B in sizes 9- and 11-in. (229- and 279-mm) diameter and Style C) anodes shall be packed in unit pallet loads or in boxes in accordance with the following:
S2.2.2.2 Pallets shall be as specified in S2.2.1.2.
S2.2.2.3 The boxes shall be in accordance with Federal Specifications PPP-B-621, Class 1, or PPP-B-601 (domestic type). The gross weight of the box shall not exceed approximately 500 lb (227 kg). Box closure shall be in accordance
with the applicable box specification or appendix thereto. The boxes shall be modified by the addition of skids, for gross weights exceeding 200 lb (91 kg), in accordance with the applicable box specification.

S2.2.2.4 Types ZEP, Style A and Style B in sizes 2- to 6-in. (51- to 152-mm) diameter inclusive, and ZDM anodes, packaged as specified in S2.1.1, shall be packed and snugly fitted into nailed wood and wood-cleated plywood boxes in conformance with Federal Specifications PPP-B-621, Class 1, or PPP-B-601 (domestic type), respectively. The gross weight of shipping containers shall not exceed approximately 200 lb (91 kg).

S2.2.2.5 Type ZRN anodes shall be packed in accordance with S2.2.1.5, except wood or wood-cleated containers shall be of the domestic type and for Type 3 load in accordance with Federal Specification PPP-B-601.

S2.2.2.6 The anodes shall be cushioned, blocked, and braced so as to prevent damage during shipment.

S2.2.3 Commercial—Zinc anodes that require overpacking for shipment shall be packed in accordance with Practice D 3951.

S3. Inspection

S3.1 The packaging, packing, and package marking of the anodes shall be inspected to verify compliance with the requirements of Section S2.

S3.2 The contractor is responsible for the performance of all inspection requirements as specified herein. Except as otherwise specified in the contract or purchase order, the contractor may use his own or any other facilities suitable for the performance of the inspection requirements specified herein, unless disapproved by the purchaser. The purchaser reserves the right to perform any of the inspections set forth in the specification where such inspections are deemed necessary to ensure supplies and services conform to prescribed requirements.
Standard Specification for Sliding Watertight Door Assemblies¹

This standard is issued under the fixed designation F 1196; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the design, manufacture, and testing of sliding watertight door assemblies intended to ensure the watertight integrity of personnel access openings in watertight bulkheads.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:
- A 36/A 36M Specification for Carbon Structural Steel²
- F 1197 Specification for Sliding Watertight Door Control Systems³

2.2 Military Specification:
- MIL-S-901 Shock Test, H.I. (High Impact); Shipboard Machinery, Equipment and Systems, Requirements for⁴

2.3 American Bureau of Shipping:
- Rules for Building and Classing Steel Vessels⁵

2.4 Code of Federal Regulations:⁶
- Title 46, Part 159.010, Independent Laboratory: Acceptance, Listing and Termination
- Title 46, Part 163.001, Doors, Watertight, Sliding (and Door Controls), for Merchant Vessels (through the 1991 edition)

2.5 International Maritime Organization (IMO):
- International Code for the Application of Fire Test Procedures (FTP)⁷

3. Terminology

3.1 Definitions:

3.1.1 door assembly—a door panel and its associated panel stiffening.

3.1.2 frame assembly—a rigid frame designed to be attached to a watertight bulkhead. The guide tracks necessary to ensure proper door and frame alignment are also included as part of the frame assembly.

3.1.3 horizontal sliding watertight door—a sliding watertight door that opens and closes with a horizontal movement.

3.1.4 opening hand—the direction in which a horizontal sliding watertight door opens. A left-hand opening door opens to the left when viewed from the side of the bulkhead on which the door assembly is located. A right-hand opening door opens to the right when viewed from the side of the bulkhead on which the door assembly is located.

3.1.5 pressure head—the pressure which a sliding watertight door assembly is designed to withstand. For a door located below the bulkhead deck, it is equivalent to the pressure exerted by a column of water the height of which is equal to the vertical distance from the bulkhead deck to the door sill in its installed location. For a door located above the bulkhead deck, it is equivalent to the pressure exerted by the maximum head of water for its location, as determined in the damage stability calculations.

3.1.6 sliding watertight door assembly—a steel door assembly and a steel frame assembly fitted with a replaceable interface between the two that ensures watertightness between door and frame at the design pressure head.

3.1.7 vertical sliding watertight door—a sliding watertight door that opens and closes with a vertical movement.

4. Classification

4.1 Sliding watertight doors consist of four types:

4.1.1 Type IA—Horizontal doors that conform to the sizes specified in Table 1 as illustrated in Fig. 1.

4.1.2 Type IB—Vertical doors that conform to the sizes specified in Table 2 as illustrated in Fig. 2.

4.1.3 Type IIA—Horizontal doors that conform generally to the requirements of this specification, but that necessitate special requirements as indicated in Section 5.

---

¹ This specification is under the jurisdiction of Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.03 on Outfitting.

⁴ Available from Standardization Documents Order Desk, Bldg. 4 Section D, 700 Robbins Ave., Philadelphia, PA 19111-5094, Attn: NPODS.

⁵ Available from American Bureau of Shipping, ABS Plaza, 16855 Northchase Dr., Houston, TX 77060.

⁷ Available from the International Maritime Organization, 4 Albert Embankment, London, SE1 7SR UK.
4.1.4 Type IIB—Vertical doors that conform generally to the requirements of this specification, but that necessitate special requirements as indicated in Section 5.

4.2 Watertight doors consist of three classes:

NOTE 1—These classifications are in agreement with those defined and accepted by the International Convention for the Safety of Life at Sea (SOLAS), regulatory bodies, and classification societies.

4.2.1 Class 1—Doors that are hinged and dogged. This specification is not applicable to this class of door.

4.2.2 Class 2—Sliding doors that are operable both locally and remotely by hand gear.

4.2.3 Class 3—Sliding doors that are operable both locally and remotely by hand and by power.

5. Ordering Information

5.1 The following shall be specified when ordering:

5.1.1 Quantity,
5.1.2 Type,
5.1.3 Class,
5.1.4 Size,
5.1.5 Opening hand,
5.1.6 Door and frame material,
5.1.7 Pressure head (if other than standard),
5.1.8 Supplementary requirements (if any),
5.1.9 Additional requirements as contracted by the manufacturer and purchaser, and
5.1.10 ASTM specification designation.

6. Design

6.1 Sliding watertight door assemblies shall be designed to maintain watertightness within the limits set forth in this specification. Doors shall be designed to open and close within the limitations specified in Specification F 1197.

6.2 Assemblies shall be of substantial and rigid construction to ensure that doors can be closed under a static head equivalent to a water height of at least 1 m above the sill on the centerline of the door.

6.3 There shall be a replaceable interface between the door and frame assemblies, such as a brass rubbing strip or resilient gasket, to ensure watertightness between door and frame at the design pressure head.

6.3.1 The replaceable interface may be incorporated into the door assembly, the frame assembly, or both.

6.3.2 Assemblies shall be designed and constructed so as to be capable of preventing the passage of smoke and flame to the end of the 1-h standard fire test described by IMO FTP.
specified by the purchaser, assemblies shall also be insulated to prevent the transfer of heat to at least the same degree as the adjacent bulkhead. A fire test is not required if the assembly design incorporates details that have been demonstrated such as by a fire test on a similar door with smaller dimensions, to prevent the passage of smoke and flame. Also, a separate pressure test to determine continued watertightness after the standard fire test is not required.

6.3.3 Assemblies shall be designed in such a manner that the replaceable interface will be protected from damage when the door is in the open position.

6.4 Sliding watertight door assemblies shall be designed to provide sufficient allowance or means of adjustment to maintain the original watertight integrity as the watertight joint wears through normal usage.

6.5 Means shall be provided for lubrication of all parts necessary for satisfactory operation.

6.6 Sliding watertight door assemblies shall have a maximum horizontal opening of 48 in. (122 cm).

6.7 Door Assemblies—Type I (standard) doors are designed for a pressure head of 20 ft (6 m) of water. Type II (nonstandard) doors shall be designed for the pressure head as specified in 3.1.5 and 5.1.7, but not less than 20 ft (6 m) for doors installed below the bulkhead deck.

6.7.1 The door panel and panel stiffener assembly shall be designed based on 40% of the yield strength of the material used to construct the panel and its stiffeners (see 7.1).

6.7.2 The door panel and stiffener assembly shall have a maximum deflection of span/240.

6.7.3 Retaining grooves or aligning strips shall be provided at the tops and bottoms of horizontal assemblies and at the sides of vertical assemblies to maintain doors in proper alignment when they are not in the closed position.

6.8 Frame Assemblies—The door frame shall be continuous on all four sides. The door frame shall be of sufficient rigidity to maintain a watertight seal under the applicable operating conditions and the design head as specified in 6.7.

6.8.1 If the door frame is to be welded to the bulkhead on a reinforcing member, which acts as a secondary frame and which is continuous around the door opening, the I of that member may be included to obtain the required frame I value. (See also the Appendix X1.)

6.8.2 The frame extension for sliding watertight doors shall be made in one continuous piece, or suitable construction shall be used to ensure proper alignment.

6.8.3 Horizontal doors shall be supported by lubricated rollers to maintain alignment and minimize friction.

6.8.4 The bottom of the frame assembly shall be designed so the door will not be prevented from closing properly by lodgements of dirt or debris.

6.8.5 A sill plate of 3/16-in. (5-mm) minimum thickness may be used to cover the bottom trackway provided it is designed to retract automatically when the door closes. Sill plate hinges shall be designed and located to prevent clogging with dirt.

6.9 Actuating Component Attachments—Assemblies shall be fitted with the necessary attachments for actuating components and controls.

6.9.1 Door control systems shall comply with the requirements of Specification F 1197.

7. Materials and Manufacture

7.1 Materials:

7.1.1 The door panel, panel stiffness, door frame, tracks, and all attachments affecting watertight integrity shall be made of a material accepted in the Rules for Building and Classing Steel Vessels of the American Bureau of Shipping (ABS Rules) for use in the fabrication of watertight subdivision bulkheads, for example, Specification A 36/A 36M steel. Special consideration shall be given to the choice of materials for components exposed to corrosive environments such as on assemblies located in engine rooms and cargo holds.

7.1.2 All fasteners shall be brass or stainless steel suitable for the purpose intended.

7.2 Manufacture:

7.2.1 All welding of the door frame shall be continuous. Door panel stiffeners may be attached by intermittent welding. All welding shall be in accordance with the requirements of Part I, Section 30 of the ABS Rules.

7.2.2 All load-bearing main structural components of the door and frame shall have a minimum thickness of ¼ in. (7 mm).

7.2.3 The contact surfaces of the door and frame shall be finished as necessary to provide a plane surface and a joint that meets the requirements of this specification. Cast doors and frames, and doors and frames fabricated by welding, shall be thermally stress relieved before final machine work is performed.

8. Workmanship, Finish, and Appearance

8.1 All sharp and ragged edges shall be ground flush and removed.

8.2 Door, frame, and guide rail assemblies shall be abrasive blasted to “near white” metal in accordance with good commercial practice and coated with a nonhazardous primer.

9. Inspection and Testing of Doors

9.1 Shop Tests and Inspections (see also the Supplementary Requirements):

9.1.1 Visual Examination—Each completed door and frame shall be examined for quality workmanship and to assure conformance to design plans and this specification.

9.1.2 Hydrostatic Test—Each completed sliding watertight door assembly shall be subjected to a hydrostatic shop test to verify its strength, rigidity, workmanship, and watertightness.

9.1.2.1 Hydrostatic Test Setup—The door frame shall be mounted in either a vertical or horizontally flat position on a reinforced test plate or slab. Means shall be provided to vent air from the enclosure formed by the door, frame, and plate and to supply water, at the required test pressure, to this enclosure. Means shall also be provided for catching and measuring the amount of water that leaks between sealing surfaces of the door panel and frame. Except in the case of double-seated doors, it will only be necessary to apply pressure to that side of the door which will tend to separate the sealing surfaces.

9.1.2.2 Hydrostatic Test Procedure—The door shall be closed by operating equipment that restricts the amount of
closing force to that available from the operating gear to be used in the shipboard installation. The enclosure shall then be completely filled with water, the air shall be vented, and the test pressure shall be applied and held for at least 10 min during which time the leakage rate shall be determined. The test pressure shall not be less than that specified in 6.7 and 6.8. The measured leakage rate,  \( A \), shall not exceed that given by the following formula:

\[
A \text{ (gal/h)} = \frac{\left(P + 15\right)}{30} \times \left(\frac{h^3}{1600 \text{ or } p^3}{130}\right)
\]

where:
- \( P \) = perimeter of door opening, ft;
- \( h \) = test head, ft; and
- \( p \) = pressure, lb/in.\(^2\).

10. Certification

10.1 The manufacturer shall furnish to the purchaser written certification for each sliding watertight door assembly. The certification shall specify that the assembly has been manufactured, inspected, and tested in accordance with this specification and that it has been found to meet the requirements contained herein (see also S3.1.3).

11. Nameplate

11.1 Watertight Door Nameplate—A substantial corrosion-resistant nameplate shall be permanently attached to each watertight door on which is legibly stamped the name of the manufacturer, manufacturer’s serial number, ASTM specification designation, pressure head, the fire endurance rating in accordance with IMO FTP, and the date (see also Supplemental Requirement S4).

12. Packaging and Package Marking

12.1 Sliding watertight door assemblies shall be crated or attached to a pallet in a manner acceptable for shipment by a common carrier. The door and door frame assemblies shall be shipped as one unit.

12.2 Machined surfaces shall be coated with a preservative before shipment.

12.3 Operating controls should be packaged with the door for shipment. See Specification F 1197 for packaging requirements for controls.

12.4 Marking—Shipments shall be marked with the customer and purchase order, ASTM specification designation, classification, size, and other pertinent data as required by the applicable purchase order.

13. Keywords

13.1 marine; ship; shipboard equipment; watertight doors

**SUPPLEMENTARY REQUIREMENTS**

The following supplementary requirements shall apply only when specified by the purchaser in the contract or order.

S1. Installation Tests and Inspection

S1.1 Visual Inspection—The sealing surfaces of sliding watertight door assemblies shall be examined insofar as possible without dismantling the door. Surface blemishes shall be corrected by stoning or draw-filing.

S1.2 Tests for Tightness:

S1.2.1 Feeler Gage Test—Sliding watertight door assemblies that have a machined interface between the door and frame shall be sufficiently tight to reject the insertion of a 0.003-in. (0.076-mm) feeler gage, or its clear passage through and between the sealing surfaces, at any point around the sealing perimeter.

S1.2.2 Hose Test—Sliding watertight door assemblies that incorporate a nonmetallic gasket between the door and frame shall be hose tested after installation. Water at a hose pressure of 50 psi (345 kPa) shall be supplied through a smooth bore nozzle with an orifice opening of 3/8 in. (15.9 mm), attached to a 1 1/2-in. (38-mm) hose. The nozzle shall be held at a distance of no greater than 5 ft (1.5 m) from the door. The stream shall be directed at all points of the door/frame interface. No leakage shall occur.

S2. Shock Testing

S2.1 Shock testing shall be conducted in accordance with MIL-S-901.

S2.2 The purchaser shall specify the required door positions during the test (for example, open, closed, or both).

S3. Prototype Verification

S3.1 The following additional requirements must be met for a prototype of each sliding watertight door assembly to be installed in subdivision bulkheads aboard vessels inspected and certified by the U.S. Coast Guard. Doors manufactured in accordance with 46 CFR Part 163.001 (through the 1991 edition) need only meet the additional marking requirements of S4.

S3.1.1 Plans and calculations for each assembly design shall be certified by a registered professional engineer as complying with the design requirements of Section 6 of this specification. Certified plans and calculations shall be permanently maintained by the manufacturer and made available to the Coast Guard and purchaser upon request.
S3.1.2 The inspection and testing required by Section 9 of this standard specification shall be conducted on a prototype of each sliding watertight door assembly design and witnessed by any classification society or by an organization that meets the requirements of 46 CFR Part 159.010. Test results shall be permanently maintained by the manufacturer and made available to the Coast Guard and purchaser upon request.

S3.1.3 The certification required by Section 10 of this specification shall also include the name and registration number of the professional engineer who certified the plans and calculations in accordance with S3.1.1 and the date that such certification was made. It shall also include the name of the independent third-party employee who witnessed the tests and conducted the inspections required by S3.1.2, the testing organization for whom the inspector works, and the date on which the tests were successfully completed.

S4. Additional Marking

S4.1 For doors intended for installation aboard vessels inspected and certificated by the U.S. Coast Guard, including doors manufactured in accordance with plans previously approved under 46 CFR Part 163.001, the watertight door nameplate required by 11.1 of this specification shall include the following additional phrase: “Suitable for installation in subdivision bulkheads abroad vessels inspected and certificated by the U.S. Coast Guard.”

APPENDIX
(Nonmandatory Information)

X1. INSTALLATION

X1.1 Bulkhead Reinforcement—Before a sliding watertight door assembly is installed in a vessel, the bulkhead in the vicinity of the door opening shall be stiffened in accordance with plans previously submitted by the shipyard or naval architect and approved by the U.S. Coast Guard and ABS. Such bulkhead stiffeners, or deck reinforcement where flush deck door openings are desired, shall not be less than 6 in. (152 mm) nor more than 12 in. (305 mm) from the door frame in order that an unstiffened diaphragm of bulkhead plating 6 to 12 in. (152 to 305 mm) wide is provided completely around the door frame. Where such limits cannot be maintained, the applicable classification society and regulatory body should be contacted for specific approval of the particular installation. In determining the scantlings of these bulkhead stiffeners, the door frame should not be considered as contributing to the strength of the bulkhead. Provision shall also be made to support the thrust bearings and other equipment that may be mounted on the bulkhead or deck adequately.

X1.2 Sliding watertight door frames may be either bolted or welded watertight to the bulkhead.

X1.2.1 If bolted, a suitable thin heat- and fire-resistant gasket or suitable compound shall be used between the bulkhead and the frame for watertightness. The bulkhead plating shall be worked to a plane surface in way of the frame when mounting.

X1.2.2 If welded, precaution shall be exercised in the welding process so that the door frame is not distorted.
Standard Specification for Sliding Watertight Door Control Systems

This standard is issued under the fixed designation F 1197; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope
1.1 This specification covers the design, manufacture, and testing of controls and operating mechanisms for use with sliding watertight doors meeting the requirements of Specification F 1196.
1.2 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are for information only.

3. Terminology
3.1 Definitions:
3.1.1 control station—a location from which a sliding watertight door may be closed.
3.1.2 door control—the device that must be physically activated by the operator to initiate the opening or closing of a sliding watertight door.
3.1.3 door control system—the system of components necessary to operate a sliding watertight door, consisting of the door control, operating mechanism, and interconnecting components.
3.1.4 electrical control voltage—the voltage applied to the door controls, indicators, and alarms.
3.1.5 electrical system voltage—the voltage generated by the electrical power sources at which the operating mechanism will operate.
3.1.6 interconnecting components—those components between the door control and the operating mechanism necessary to cause the operating mechanism to move a sliding watertight door as directed by the door control or between the door and the remote indicator. Interconnecting components form a mechanical, hydraulic, or electrical system between the control station and the door and between the door and the remote indicator.
3.1.7 local control station—a location adjacent to a sliding watertight door from which the door may be opened or closed.
3.1.8 manual control—a door control that requires the operator to apply a continuous cyclic force, for example, the turning of a handwheel or operating of a pump handle, to cause the operating mechanism to function.
3.1.9 operating mechanism—the device, be it mechanical, electric, or hydraulic, that directly causes a physical force to be placed upon a sliding watertight door to cause its movement.
3.1.10 power control—a door control that requires the operator to exert a minimal physical force, for example, pushing of a

button, flipping of a switch, or holding of a lever, to cause the operating mechanism to function.

3.1.10 remote control station—a location from which a door or doors can be remotely closed.

3.1.11 remote indicator—the device, mechanical or electric, located at a remote control station that indicates whether a door is open, closed, or at an intermediate position.

4. Classification

4.1 Sliding watertight door control systems are of the following types:

4.1.1 Manual—a door control system that requires the operator to apply a continuous cyclic force to the door controller to cause the operating mechanism to function. Manual control systems consist of the following types:

4.1.1.1 Mechanical—An operating system, such as that consisting of a handwheel, shafting, gears, universal joints, and a rack and pinion assembly.

4.1.1.2 Hydraulic—A system consisting of a hand pump, fluid power cylinder, and interconnecting pipe, tubing, valves, and fittings.

4.1.2 Power—A door control system that requires only that the operator exert a minimal physical force to cause the operating mechanism to function. Power control systems consist of the following types:

4.1.2.1 Electric—A system consisting of a pushbutton, switch, or lever that activates, through an electric circuit, an electric motor that drives a rack and pinion operating mechanism that applies the necessary force to open and close the door.

4.1.2.2 Hydraulic—A system consisting of a lever-operated control valve, hydraulic accumulator, and interconnected pipe, tubing, valves, and fittings that actuates a fluid power cylinder operating mechanism that applies the necessary force to open and close the door.

4.1.2.3 Electrohydraulic—A system consisting of a combination of electric and hydraulic components, whereby a pushbutton, switch, or lever, through an electric circuit, activates an electric motor that drives a hydraulic pump that supplies hydraulic fluid under pressure to an operating mechanism consisting of a fluid power cylinder that applies the necessary force to open and close the door.

5. Ordering Information

5.1 Specify the following information when ordering:

5.1.1 Quantity,

5.1.2 Door type,

5.1.3 Door class,

5.1.4 Opening hand,

5.1.5 Door size,

5.1.6 Design pressure head of door,

5.1.7 Type of control system,

5.1.8 Electrical system voltage,

5.1.9 Electrical control voltage,

5.1.10 Distance from the door to remote control stations,

5.1.11 Remote control panel requirements (if applicable),

5.1.12 Supplementary requirements (if any),

5.1.13 Additional requirements as contracted by the manufacturer and purchaser, and

5.1.14 ASTM specification designation.

6. Materials and Manufacture

6.1 Cast iron components shall not be used unless shock tested and approved in accordance with MIL-S-901.

7. Design of Manual Operating Controls

7.1 All sliding watertight doors shall be provided with a means of local and remote manual operation.

7.2 The maximum force required to operate each manual control shall be 25 lbs (11 kg), except that a maximum force of 50 lbs (23 kg) is acceptable during wedging if applicable.

7.2.1 Hand pumps may operate with an all around crank motion or a reciprocating motion.

7.2.2 Handwheels shall be at least 18 in. (457 mm) in diameter.

7.3 Manual controls shall remain stationary when the door is operated by other means.

7.4 Local Manual Controls:

7.4.1 Local manual controls shall be capable of opening and closing each door from both sides of the bulkhead.

7.4.2 Local manual controls shall be located within 10 ft (3 m) of, and in visual contact with, the door.

7.4.3 Local manual controls shall always operate, even in the event of rupture of hydraulic lines more than 10 ft (3 m) from the door.

7.5 Remote Manual Controls:

7.5.1 A remote manual control shall be provided above the bulkhead deck to close each door remotely.

7.5.1.1 It shall not be possible to open a door remotely.

7.5.2 A remote indicator, operable under all conditions, shall be located at the remote manual control station to indicate whether the door is open or closed.

8. Design of Power Operating Controls

8.1 Each Class 3 door, as defined in Specification F 1196, shall be provided with local power controls for opening and closing the door and remote power controls for closing the door. Door control systems intended for installation aboard Coast Guard inspected and certificated vessels shall comply with Supplementary Requirements S1 through S4 in addition to the following.

8.1.1 Local Power Controls:

8.1.1.1 Local power controls shall be so located that they may be held in the open position by a person passing through the doorway.

8.1.1.2 The controls shall be at least 48 in. (122 cm) above the deck.

8.1.1.3 The direction of movement of handles used to open and close the door shall be in the direction of the door movement.

8.1.2 Remote Power Controls:

8.1.2.1 Remote power controls shall be located on a central control station located on the navigating bridge.

8.1.2.2 The central control station shall have a “master mode” switch with two modes of control. (I) The “local control” mode shall allow any door to be locally opened and locally closed after use without automatic closure of the door.
8.1.2.3 A diagram shall be provided on the central control station showing the location of each door, with visual indicators to show whether each door is open or closed. A red light shall indicate that a door is fully open, and a green light shall indicate that it is closed. A flashing red light shall indicate that a door is in an intermediate position.

8.1.2.4 The central control station shall be fitted with a test button to verify that all lights at the station are in proper working order.

8.2 Actuating Components—Doors that are required to be power operated shall be fitted with the necessary equipment to use electric, hydraulic, or other power sources. Actuating components include hydraulic valves, electric operators, or other suitable means of sequencing for automatic operation. Each drive unit shall be protected from injury caused by a jammed door, excessive electrical current, or excessive hydraulic or pneumatic pressure. No clutch device shall be used.

8.3 Connections and circuits shall be designed and installed so that a failure in one door circuit will not cause a failure in any other door circuit. Any failure in an alarm or indicator circuit shall not result in a loss of power for the door operation. The control system shall be such that a short or open circuit will not result in a closed door opening. The connections shall be such that leakage of salt water into local controls shall not establish a circuit that will cause a closed door to open.

9. Design of Electrical Components

9.1 Electrical components shall meet the applicable requirements of IEEE Standard 45.

9.2 Electrical motors, associated circuits, and control components located below the bulkhead deck shall be designed to operate submerged (NEMA 6 per NEMA Publication IS1.1).

9.2.1 Electric door position circuits and components located below the bulkhead deck shall be hermetically sealed, as defined in IEEE 100.

9.3 Door movement warning signals and all electrical equipment located above the bulkhead deck shall be watertight (NEMA 4 per NEMA Publication IS1.1).

10. Design of Hydraulic Components

10.1 All hydraulic components shall be designed with a minimum 4:1 factor of safety.

10.2 Hydraulic cylinders shall be designed for a bursting pressure of not less than four times the maximum allowable working pressure.

10.3 Accumulators shall be designed, constructed, and tested in accordance with Section VIII, Division 1 of the ASME Code.

10.4 Hydraulic pipe and tubing shall be stainless steel, Specification A 312/A 312M, or seamless tubing, SAE J524 or J525.

10.5 Hydraulic fluids shall have a minimum flashpoint of 315°F. In addition, the fluid shall be suitable for operation of the hydraulic system through the entire temperature range to which it may be subjected.

11. Operating Requirements

11.1 Door control systems, both manual and power, shall be designed to open and close doors against a 15° list. In addition, the operating mechanisms shall be designed to close the door against a static head equivalent to a water height of at least 1 m above the sill on the centerline of the door.

11.2 A manual control system must be designed to close a door in not more than 90 s.

11.3 All hydraulic systems shall be designed so that any hydraulic “line’’ break more than 10 ft (3 m) from the door will not prevent local power or hand closing or remote power closing of the door.

11.4 Power control systems shall close doors at an approximately uniform rate of closure, but in no case shall the closure time, from the time a door begins to move to the time it reaches the fully closed position, be less than 20 s or more than 40 s.

11.4.1 Simultaneous Closing—Means shall be provided for closing all power-operated doors simultaneously. When a large number of doors are involved, automatic means may be provided for operating the doors in sequence, with preference being given to doors in the lowest part of the vessel. The arrangement shall be such that all doors can be closed in not more than 60 s after actuation of the master mode switch.

11.5 An audible alarm, distinct from any other alarm in the area, shall give warning whenever the door is closed remotely by power and shall sound for at least 5 s, but no more than 10 s, prior to door movement for Class 3 doors. In the case of remote hand operation, the audible alarm may be configured to sound only when the door is moving. Additionally, consideration should be given to supplementing the audible alarm with a visual alarm in high noise areas.

11.6 See Supplementary Requirements for installation details.

12. Inspection and Testing of Doors and Controls

12.1 Shop Tests and Inspections:

12.1.1 Shop Test of Operating Controls—A prototype of one door and frame of each design together with its manual operating equipment, and in addition its power control equipment if a Class 3 door, shall be mounted on a structure in the shop in a vertical position. The setup for horizontal sliding doors shall be such that it can be tilted one way to demonstrate that the manual controls can close the door against a 15° list and, in addition for Class 3 doors, that electrical and hydraulic operators can close the door under 87.5 % normal voltage. In addition, a 15° opposite list shall be applied to demonstrate that the door will not overhaul and close itself and, when closed, can be opened manually and by power. Operating mechanisms shall close a door against an actual or simulated (such as with dead weight) static head equivalent to a water height of at least 1 m above the sill on the centerline of the door. Class 3 doors shall also be tested to show that a door can be unseated manually after being closed by power.
13. Certification
13.1 The manufacturer shall furnish written certification to the purchaser for each control system. The certification shall specify that the control system has been manufactured, inspected, and tested in accordance with this specification and that it has been found to meet the requirements contained herein.

14. Packaging
14.1 Components for sliding watertight door control systems shall be shipped with the door and door frame assembly with which they will be installed.

14.2 Hydraulic and electric components shall be adequately protected and shipped in reinforced cartons or crates.

14.3 All hydraulic components shall have all oil drained and proper preservation applied.

15. Keywords
15.1 door; door control; electric door control; electrohydraulic door control; manual door control; hydraulic door control; marine; marine door; mechanical door control; power door control; ship; ship door; sliding door; watertight door; watertight sliding door

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the contract or order.

S1. Power Supplies—The primary power supply for all required Class 3 doors shall come directly from the vessel emergency switchboard.

S2. All electric controls, indicators, and alarms shall be supplied from the final emergency power source.

S3. Power Sources—All Class 3 doors shall be provided with one of the following types of power sources:

S3.1 A centralized system with two independent power sources each consisting of a pump capable of simultaneously closing all doors in not less than 60 s. In addition, there shall be for the whole installation hydraulic accumulators of sufficient capacity to operate all of the doors at least three times, that is, close-open-close. A single failure in the hydraulic piping of the power source operating system shall not affect the power operation of more than one door.

S3.2 An individual hydraulic system for each door with one power source capable of closing the door. In addition, there shall be a hydraulic accumulator of sufficient capacity to operate the door at least three times, that is, close-open-close.

S3.3 An individual electrical system for each door with one power source capable of closing the door. In addition, there shall be a battery of sufficient capacity to operate the door at least three times, that is, close-open-close.

S4. Installation Tests and Inspection:

S4.1 Manual Control Installation Test—After a door and controls have been installed, the door shall be closed and opened by means of the manual controls at the door and shall be closed by the manual remote control. The time and effort required to close the door shall be within the limitations prescribed in 7.2 and 11.2.

S4.2 Power Control and Installation Test—If power controls are provided, the door shall be operated by the power controls from each of the control stations. The rate of closing shall be as prescribed in 11.4. The time required to simultaneously close all doors shall be as prescribed in 11.4.1. Manual controls shall also be operated to show that closure by power will not jam the door so as to prevent manual opening.

S4.3 Remote Indicator Operation—The remote indicator at the remote manual control station shall correctly show the position of the door when either manual or power operation is employed, and when power to the door is interrupted.
Standard Guide for
Shipboard Fire Detection Systems

This standard is issued under the fixed designation F 1198; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide covers the selection, installation, maintenance, and testing of shipboard fire detection systems other than sprinkler systems.

1.2 This guide is intended for use by all persons planning, designing, installing, or using fire alarm systems onboard vessels. As it includes regulatory requirements, this guide addresses those vessels subject to regulations and ship classification rules. However, the principles stated herein are also suitable for unregulated commercial vessels, pleasure craft, military vessels, and similar vessels that are not required to meet regulations for fire detection and alarm systems.

1.3 Limitations—This guide does not constitute regulations or ship classification rules, which must be consulted when applicable.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 Code of Federal Regulations:
Title 46, Part 76.25
Title 46, Part 76.30
Title 46, Part 76.33
Title 46, Part 161.002
2.2 NFPA Publications:
NFPA 72E Standard on Automatic Fire Detectors

2.3 SOLAS Regulations:
SOLAS II-2/13-1
SOLAS II-2/12

3. Terminology

3.1 Definitions:
3.1.1 accommodation space—those spaces used for public spaces, corridors, lavatories, cabins, bunkrooms, staterooms, offices, hospitals, cinemas, game and hobby rooms, barber shops, pantries containing no cooking appliances, and similar spaces.

3.1.2 alarm signalling device—an audible or visual device such as a bell, horn, siren, strobe, flashing, or rotating light used to warn of a fire condition.

3.1.3 annunciator—an audible and visual signalling panel that indicates and displays the alarm, trouble, and power conditions of the fire detection system.

3.1.4 approved—acceptable to the organization, office, or individual responsible for accepting equipment, an installation, or a procedure.

3.1.5 automated machinery space—a space containing machinery that is automated to allow: (a) periodic unattended operation by the crew; and (b) continuous manual supervision by the crew from a central room (enclosed) or remote location.

3.1.6 control panel—an electrical panel that monitors and controls all of the equipment associated with the fire detection and alarm system.

3.1.7 control space—an enclosed space within which is located a ship’s radio, main navigating equipment, emergency source of power, or the centralized fire recording or fire control equipment, but not including firefighting apparatus that must be located in the cargo area or individual pieces of firefighting equipment.

3.1.8 hazardous (classified location)—locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable or combustible liquids, combustible dust, or ignitable fibers or flyings.

3.1.9 listings—equipment or materials included in a list published by an organization certified to perform product

---

1 This guide is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.10 on Electrical.

3 Available from National Fire Protection Association, One Batterymarch Park, Quincy, MA 02269-9101.

4 Available from International Maritime Organization, 4 Albert Embankment, London, England SE1 7SR.
evaluations. This organization maintains periodic inspections of production of the listed equipment or materials. The listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

3.1.10 machinery spaces of Category A—those spaces and trunks to such spaces which contain: (a) internal combustion machinery used for main propulsion; or (b) internal combustion machinery used for purposes other than main propulsion where such machinery has, in the aggregate, a total power output of not less than 500 hp (375 kW); or (c) any oil-fired boiler or oil fuel unit.

3.1.11 main vertical zones—those sections, the mean length of which does not, in general, exceed 131 ft (40 m) on any one deck, into which the hull, superstructure, and deck houses are required to be divided by fire-resisting bulkheads.

3.1.12 manually activated fire alarm box—a box containing an electrical switch which, when manually operated, sends an alarm signal to the control panel (referred to as “Manually Operated Call Points” by SOLAS).

3.1.13 RO/RO cargo space (roll on/roll off cargo spaces)—a space not normally subdivided in any way and extending to either a substantial length or the entire length of the ship in which cargo, including packaged cargo, in or on rail or road cars, vehicles (including road or rail tankers), trailers, contain-
ers, pallets, or demountable tanks (in or on similar stowage units or other receptacles), can be loaded and unloaded normally in a horizontal direction.

3.1.14 self restoring—the ability of a device to reset itself automatically after being activated.

3.1.15 service space—those spaces used for galleys, pan-
tries containing cooking appliances, lockers, mail, and specie rooms, store rooms, workshops other than those forming part of the machinery spaces, and similar spaces as well as trunks to such spaces.

3.1.16 special category space—an enclosed space above or below the bulkhead deck intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion, into and from which such vehicles can be driven and to which passengers have access.

3.1.17 supervised—describes an electronic method of moni-
toring the electrical continuity of the circuits and devices of a fire detection and alarm system. This is normally accomplished by constantly passing a small current through the circuits and devices.

4. Significance and Use

4.1 The purpose of a shipboard fire detection system is to provide warning so as to reduce the life safety threat from fire and to minimize the fire threat to the operation of the ship. Given that few ships are identical either in size or layout, it follows that the fire detection system will have to be custom designed accordingly. A well-designed system provides a reasonable substitute to having crew members on constant fire watch in every protected space where a fire might occur.

4.2 The basic function of the fire detection system is to automatically and reliably indicate a fire condition as quickly as is practical and to alert responsible individuals of a fire’s existence and location. This system design and application guide addresses the individual steps in the layout of the system as well as an overview of the information needed to design a system.

4.3 The U.S. Coast Guard and the International Convention for the Safety of Life at Sea (SOLAS) regulations have been stated as requirements within this guide. Additional guidelines to assure complete and effective systems or to incorporate good industry practices are stated as recommendations.

DESIGN AND APPLICATION

5. System Types

5.1 Fire detection and alarm systems used on vessels are typically of the following types:

5.1.1 Electrical automatic fire detection and alarm systems consist of a control panel, various types of fire detectors, manually actuated fire alarm boxes, audible and visual alarms, and appropriate power supplies. The control panel monitors the fire detection and alarm circuits and generates appropriate signals when an automatic fire detector or manual fire alarm box is activated.

5.1.2 A similar system without automatic fire detectors is referred to as a manual fire alarm system but is otherwise identical. Operation is initiated by individuals who activate a manually actuated fire alarm box that incorporates an electrical switch. This guide is primarily concerned with electrically operated automatic and manual fire detection and alarm systems.

5.1.3 Pneumatic fire detection systems consist of a closed length of pneumatic tubing attached to a control unit. Air chambers called heat actuated devices (HADs) are often attached to the tubing in the protected area to increase the volume and thus the sensitivity of the system. As temperature builds up in a fire, the air in the tubing expands, moving a diaphragm in the control unit. A small calibrated vent compensates for normal changes in ambient temperature. The diaphragm activates a release mechanism or a set of contacts. Because pneumatic fire detection systems are self-contained (that is, independent of outside sources of power), they are often used to activate small automatic fire extinguishing systems such as are installed in paint lockers and emergency generator enclosures. U.S. Coast Guard Requirements for pneumatic fire detection systems may be found in Title 46, Code of Federal Regulations, Part 76.30.

5.1.4 Sample extraction smoke detection systems consist of a piping system connected to a control unit with a suction blower. These systems continually draw samples from the protected spaces to the control unit where a light source and photocell monitor the sample for smoke. Sample extraction smoke detection systems are often used in cargo holds because they are less likely than individual spot-type smoke detectors to operate from dust or localized sources of smoke such as vehicle exhausts. Also, the more delicate electronics and control equipment can be located remote from the harsh environment of a cargo hold. These systems are often combined with a carbon dioxide extinguishing system, using the carbon dioxide distribution piping to draw samples from the protected areas. Detailed requirements for sample extraction smoke detection systems are contained in proposed SOLAS Regulation II-2/
6. Classification of Fire Detectors

6.1 Heat detectors are devices that sense a fixed temperature or rate of temperature rise. Heat detectors work on one of the three operating principles outlined in 6.2, 6.3, and 6.4.

6.2 A fixed temperature detector is a device that responds when its operating element becomes heated to a predetermined level. Because of the time required to heat the mass of element to its preset level, there is usually a lag time, referred to as the “thermal lag,” between the time the surrounding air reaches the operating temperature and the time the operating element reaches its preset operating temperature. There are seven temperature classification ranges. In locations where the ceiling temperature does not exceed 100°F (38°C), detectors with an operating range of 135 to 174°F (57.2 to 78.9°C) should be used. These are termed “ordinary” temperature classifications. Several types of temperature sensitive operating elements are used such as:

6.2.1 Bimetallic elements consist of two metal strips with different coefficients of expansion fused together so that heating will cause the element to deflect, making electrical contact.

6.2.2 Electrical conductivity elements are devices whose electrical resistance varies as a function of temperature.

6.2.3 Certain automatic heat detectors use fusible alloy elements or liquid expansion elements that operate at a fixed temperature. These devices are nonrestorable and are prohibited by SOLAS.

6.3 A rate-of-rise detector is a device that operates when the temperature rises at a faster than predetermined rate. Since operation does not depend on having reached a fixed temperature level, it responds to a rapid temperature rise more quickly than a fixed temperature detector. However, it does not respond to a slow developing fire regardless of how high the temperature gets. In a typical rate-of-rise detector, heated air in a chamber expands to deflect a diaphragm that operates electric contacts.

6.4 A rate of compensation detector is a device which, because of differential expansion of several components, responds when the temperature of the air surrounding the detector reaches a predetermined level, regardless of the rate at which the temperature rises. It is designed to avoid the thermal lag time that is inherent in a fixed temperature detector. This device is also known as a rate anticipation detector.

6.5 Combination heat detectors take advantage of more than one operating principle in a single detector housing. Combination fixed temperature and rate-of-rise detectors are most common.

6.6 Smoke detectors are devices that detect visible or invisible products of combustion. They work on several operating principles as follows:

6.6.1 Ionization smoke detectors have a small radioactive source that ionizes the air within a chamber, making it conductive so that a small current flows between electrodes. Smoke particles entering the chamber interfere with the free flow of ions and reduce the current, activating the detector.

6.6.2 Photoelectric smoke detectors use a light source and photocell to detect the presence of smoke. Several types may be used on ships:

6.6.2.1 In the light obscuration type of detector, smoke particles that enter between the light source and the photocell reduce the amount of light reaching the photocell, causing the detector to activate. Projected linear beam smoke detectors are light obscuration smoke detectors. The light source and photocell are separately housed, and the light beam is projected across the protected area. The alignment between transmitter and receiver is critical for proper operation of this device. Shipboard vibration and flexing may affect proper alignment.

6.6.2.2 In a photoelectric light-scattering smoke detector, the components are arranged so that light does not normally reach the photocell. When smoke particles enter the chamber, they reflect or scatter some of the light onto the photocell, activating the detector.

6.6.3 Sample extraction smoke detection systems as described in 5.1.3 operate on one of the principles covered in 6.6.2.1 and 6.6.2.2.

6.7 Flame detectors are devices that detect infrared (IR), ultraviolet (UV), or visible light produced by a fire. To avoid activation by sources or radiation other than fires such as welding, sunlight, and so forth, flame detectors are usually designed to sense light modulated at a rate characteristic of the flicker rate of flames, or to detect certain bands of IR or UV or visible radiation characteristic of flames, or some combination of these features. A combination of these features is used in some applications to reduce the probability of false alarms.

6.8 Other classifications of fire detectors include: (a) gas detectors that sense gases produced by burning substances; (b) resistance bridge smoke detectors that sense change in conductivity when smoke particles and moisture from fire are deposited on an electrical grid; (c) cloud chamber smoke detectors in which moisture is caused to condense on smoke particles drawn into a chamber; and (d) heat-sensitive cable in which high temperature softens the insulation separating two conductors, causing reduced resistance or shorting of the conductors, as well as devices that operate on other principles. Such detectors are seldom used on ships.

6.9 Combination detectors combine the principles of one or more classifications of fire detectors or detection principles in a single device. A common example is a fixed temperature-rate-of-rise heat detector.

6.10 All detectors, except sprinklers, are required by regulation to be restorable so that they can be tested for correct operation and restored to normal condition without replacing any component.
7. System Detector Coverage

7.1 Existing U.S. and international regulations for commercial vessels require automatic fire detection coverage in a wide range of spaces such as corridors, stairways, escape routes from accommodation spaces, RO-RO cargo spaces, and automated machinery spaces.

7.2 It is recommended that each accommodation space have detector coverage, including a detector in each stateroom. Consideration should also be given to placing detectors in other normally unattended areas where a fire may originate.

7.3 In addition to detectors, manually actuated fire alarm boxes must be installed throughout passageways of the accommodation, service, and control spaces and be located at each main exit and stairwell exit. Manually actuated fire alarm boxes are also required in all special category spaces.

8. Zoning

8.1 The fire detection system should be arranged into reasonably sized and clearly identified areas, called zones, to direct responding crew members to the fire’s location more quickly. Consideration should be given to having two detection circuits within a zone (that is, area or space). One detection circuit should be dedicated to manually actuated fire alarm boxes and the other dedicated to automatic fire detectors so that alarms can be distinguished from each other. Existing requirements limit individual detection zones as follows:

8.1.1 A zone is limited to a single deck level, except where an enclosed stairway is served by an individual detection zone. This zone can include multiple deck levels. Where the stairway is used as a main egress in the event of a fire, it is recommended that a stairway which joins four or more levels be served by a separate zone.

8.1.2 In passenger ships, separate zones are required on the port and starboard sides of the ship; however, regulations permit exceptions for special cases. Detection zones must be confined horizontally to one main vertical zone (MVZ).

8.1.3 Enclosed automated machinery spaces must be separately zoned from accommodation, service, and control spaces. Multiple small machinery spaces in the same general area may be grouped into a single zone.

9. Environmental Effects on Detectors

9.1 Because ships are able to move freely throughout the world, they can be subjected to many different environmental conditions. This makes it very important that the selection process of detectors, control panels, and other alarm system components be made by data and information available from manufacturers and testing laboratories.

9.2 Manufacturers shall be able to provide documentation and certification indicating the effect that environmental conditions such as temperature, humidity, pressure, air velocity, and electromagnetic interference (EMI), including radio frequency (R.F.), transients, corrosives, dust, and vibration, can have on detector sensitivity and performance.

9.3 Testing standards for detectors are usually minimum standards and, therefore, listed detectors are not all equal in performance. For example, smoke detectors may respond to smoke densities ranging from 0.5 to 4 %/ft obscuration. All smoke detectors are marked with their sensitivity. A detector with a 1 %/ft obscuration is more sensitive than a detector set at 3 %/ft. A 3 %/ft obscuration may prove more stable than a detector at 1 %/ft obscuration level. An engineering judgement shall be made as to which sensitivity is more acceptable for which application.

9.4 Temperature:

9.4.1 Smoke detectors placed in areas with temperatures approaching the upper or lower limits of the testing laboratory listing will undergo a shift in sensitivity as a result of those temperatures. Detector sensitivities will not shift equally; some detectors will change little and others will change more. The design and quality of the detector can make a difference in performance.

9.4.1.1 Generally, ionization detectors become either more sensitive in colder temperatures or less sensitive in warmer temperatures.

9.4.1.2 Generally, photoelectric detectors become either less sensitive in colder temperatures or more sensitive in warmer temperatures.

9.4.1.3 Flame detectors vary according to individual design. See the manufacturer’s information.

9.5 Relative Humidity (RH)—Relative humidity levels up to 95 % should not affect the performance of most detectors. However, condensate can present a problem to the stability of the detectors. Curves and documentation on the effects of relative humidity can be obtained from manufacturers of detectors.

9.6 Air Pressure:

9.6.1 Except for ionization detectors, atmospheric pressures usually have no measureable effect on detector sensitivity. For unusual circumstances, such as submarines or pressure chambers, refer to the manufacturer’s data.

9.6.2 Ionization detectors become less sensitive with a decrease in pressure and more sensitive with an increase in pressure. Curves and other documentation on the effects of pressure on detector sensitivity can be obtained from the manufacturer, testing laboratory, or both.

9.7 Air Velocity:

9.7.1 Continuous high air velocities or sudden gusts are major factors influencing the stability of some ionization detectors and may cause false alarms or delayed alarms. Curves and documentation on the effects of air velocities on detector sensitivity can be obtained from the manufacturer.

9.7.2 Some detectors use field adjustability to compensate the detector for sensitivity shifts caused by air velocity.

9.7.3 Some detectors use optional air shields to reduce the effects of air velocity on detector sensitivity.

9.7.4 Photoelectric detector sensitivities are not affected by air velocity.

9.8 Electromagnetic Interference (EMI)—RF energy from sources such as walkie talkies, telephones, and so forth may cause false alarms in ionization and photoelectric detectors. Documentation as to the levels of EMI and at what distances these energies are safe to use around detectors can be obtained from the manufacturer, testing laboratory, or both.

9.9 Other factors influencing the reliability and stability of a detector are as follows:
9.9.1 Unusually high concentrations of vapors from solvents and paints, aerosol sprays, steam, smoke products from kitchens, and tobaccos are some environmental contaminants that may cause false alarms to smoke detectors.

9.9.2 Cigarette lighters, welding, reflection of sunlight, and lightning are some of the environmental conditions that can prove troublesome for UV and IR flame detectors.

9.9.3 In selecting detectors, consideration should be given to the vibration and impact conditions that may occur on board ship. Consult the manufacturer’s data.

9.9.4 Location is an important factor in the reliability and stability of a detector. Avoid locating detectors too close to supply air ducts, doorways, and outside elements, that is, exposing detectors to hostile temperatures, wind gusts, and salt spray. Refer to NFPA 72E, Section 5.6, for additional information.

10. Detector Location

10.1 Type of Detector for Space—See Table 1.

10.2 Detector Location Within Space, general guidance (see NFPA 72E for more detailed instructions):

10.2.1 Determine the maximum detector spacing for smooth, low ceilings and no air flow.

10.2.1.1 Listings or approvals show maximum spacing distance between detectors.

10.2.1.2 Distances are determined by fire tests with prototype detectors.

10.2.2 For rooms over 10 ft (3 m) high, reduce thermal detector spacing according to Table 2. Add intermediate layers of detectors for spaces over 30 ft (9 m) high. For other classifications of detectors, reduced spacing should be considered as vertical height increases. Consult the manufacturer for specific requirements.

10.2.3 To determine the minimum number of detectors, set up a grid of squares using the adjusted maximum spacing with a detector at the center of each square.

10.2.4 Adjust the detector locations to avoid air diffusers which may blow heat and smoke away from detectors.

*Heat detectors are not necessary if sampling detectors are installed.*

10.2.5 Verify that no point in the space is more than 0.7 times the reduced maximum spacing distance horizontally from the nearest detector.

10.2.6 For smoke detectors, the maximum spacing distance between detectors is 30 ft (9 m) before reductions.

10.2.7 Line-of-sight detectors such as flame detectors have a cone-shaped area of coverage emanating from each detector. The protected area must be within the cone of vision. The maximum distance from the protected area to the detector shall not exceed the distance at which a 1-ft² (0.0929-m²) gasoline fire can be detected.

10.2.8 Add appropriate detectors where necessary to assure adequate coverage of high hazard areas or to compensate for obstructions, air flow, and so forth.

10.2.9 Detectors on the overhead should be a minimum of 1.6 ft (0.5 m) away from bulkheads.

11. Alarms

11.1 Activation of Alarms:

11.1.1 Visual and audible signals at each control panel and annunciator panel shall be automatically activated upon:

11.1.1.1 Operation of any fire detector.

11.1.1.2 Operation of any manual fire alarm station.

11.1.1.3 Development of a trouble condition in the system.

11.1.1.4 Power supply failure or transfer.

11.1.2 The section or zone in which an alarm or trouble condition occurs shall be indicated visually at the main control panel and at each required annunciator panel.

11.1.3 Operation of a fire detector or manual fire alarm station in an automated machinery space shall cause an immediate audible alarm in that space as well as in sufficient other locations to be heard by the responsible engineering officer.

11.1.4 If the above fire alarms are not acknowledged within 2 min, suitable audible alarms shall sound throughout the crew accommodations, service spaces, control spaces, and machinery spaces of Category A. These audible alarms need not be an integral part of the fire detection and alarm system but may be integrated into the general alarm or other approved alarm system.

11.2 Types of Signalling Devices:

11.2.1 Alarm signalling devices shall be continuous sounding bells, sirens, horns, or similar devices except that system trouble alarms can be a buzzer or electronically generated
11.2.2 Fire alarm signals shall be distinct from all other alarms in the space in which they are located.

11.2.3 Each signalling device must be identified by a sign with red lettering at least 1 in. (25 mm) high stating “FIRE ALARM.”

11.2.4 Fire alarm signals may be transmitted through an approved ship’s general alarm system or an approved electrically supervised public address system meeting the standards for fire alarm systems, provided the fire alarm signals are separate and distinct from any other alarm signals.

11.3 Alarm Signalling Device Location and Spacing:

11.3.1 At least one fire alarm signalling device is required in each zone or each space containing more than one zone.

11.3.2 In large zones and areas with high ambient noise levels, additional alarm signalling devices shall be provided so that alarms can be heard at any point in the protected zone with all the doors closed.

11.3.3 In areas of high ambient noise levels, flashing or strobe lights must be used to attract attention to the alarm signalling device. This device shall also be labeled “FIRE ALARM” if separate from the alarm signalling device.

11.4 Manually Actuated Fire Alarm Boxes:

11.4.1 Location—A manually actuated fire alarm box shall be located at each exit from the protected zone in the normal path of exit travel from the zone.

11.4.2 Travel Distance—Additional manually actuated fire alarm boxes shall be installed so that no point in a corridor is more than 66 ft (20 m) from a box.

11.4.3 Each manually actuated fire alarm box should be clearly marked as to what the device is, when it should be utilized, and how it should be operated.

11.5 Control Panel and Remote Annunciator:

11.5.1 The main control panel shall be located on the bridge or at the fire control station.

11.5.2 If the main control panel is located at the fire control station, a supervised remote annunciator (that is, repeater) shall be located on the bridge. It is recommended that the remote annunciator display the complete system status of the main control panel.

11.5.3 The control panel and required remote annunciators shall visually display the zone of the alarm-initiating device. An instruction chart identifying what to do in the event of an alarm or trouble signal and a graphic layout clearly displaying the zone locations shall be placed on or adjacent to the control panel and required remote annunciators.

11.5.4 Additional remote annunciators may be provided at other locations such as the engine room control station. Additional optional remote annunciators installed in other areas need not display complete systems status nor have supervised wiring.

11.6 Supplementary Monitoring Functions— Although the primary function of the control panel is to receive signals from its reporting devices and annunciate them, it may also be used for other fire-related control functions. Selective zone controlled relays can be used to close fire doors, shut down air conditioning or ventilation systems, and other similar functions in the event of a fire. In cases in which the fire detection control panel is approved for sprinkler system monitoring, separate detection circuits are required for the sprinkler system.

11.7 Power:

11.7.1 It is a requirement that there be at least two sources of power supply to the fire detection system control panel. When the ship’s main and emergency sources of power are used for this purpose, separate feeders are to be wired to an approved power transfer relay at the control panel. When power drops in the main source, the transfer relay shall automatically switch to the emergency source. It shall also automatically switch back to the main source when full voltage is sensed.

11.7.2 A dedicated battery power supply at the control panel is an acceptable second source that may be used in place of the ship’s emergency source provided the batteries are automatically charged and supervised. The battery ampere hour rating shall be capable of powering the fire detection system for a minimum of 36 h on passenger ships and 18 h on other ships and still have sufficient power to energize all alarm devices for 5 min at the end of the required battery operating time.

12. Hazardous Locations

12.1 Equipment installed in hazardous areas shall be specifically approved for hazardous areas.

12.2 All circuits in hazardous areas shall be approved as intrinsically safe or explosion proof.

12.3 The number of types of devices on intrinsically safe circuits may be limited.

13. Equipment and Design Approval

13.1 Equipment Approval:

13.1.1 The control panel, detectors, manual boxes, alarms, and other devices connected to the panel shall be tested and approved by a certified organization. The certified organization should be an independent body in the business of testing and approving of fire detection and alarm systems, including quality control, approving, follow-up testing, and labeling of products.

13.1.2 In addition to the standards used for shore-based commercial fire alarm systems, additional tests shall be performed on the equipment used in a marine environment. The additional tests evaluate the ability of the equipment to operate when exposed to humidity, vibration, salt spray, extreme temperatures, inclination, and supply voltage variation.

13.2 Design Approval:

13.2.1 The system shall be designed and installed in accordance with the equipment listing. Only equipment that has been demonstrated to the listing or approval authority to be compatible shall be used.

13.2.2 If the design of the system is required to be approved by an approval authority, the design, plans, and pertinent information necessary to make a complete system design review shall be submitted to the approval authority.

14. Requisite Drawings and Materials

14.1 Complete system drawings that show the interconnections of all devices, the number and location of devices, and
how the system is configured shall be provided. System drawings are necessary so that correct installation can be undertaken, and so that after installation is completed, the system can be maintained with these drawings.

14.2 Manufacturer’s standard manuals should be provided with the system control panel. These manuals generally contain design, installation, maintenance, and troubleshooting instructions for the system. This documentation is necessary so that in the event of system problems, a source of complete information is available.

15. Installation Coordination

15.1 Retrofits—The installation of a fire detection system onboard an existing vessel is considered to be a retrofit. All of the major shipboard equipment is already in place, and the locations of obstructions are usually known. This makes it less likely for a device to be located in an area that would later be blocked or obscured from smoke, heat of flame, or manual operation.

15.2 New Construction—The timing of the installation is more critical in new ship construction. If the fire detection system is installed in the early phases of ship construction, obstructions or blockage of the equipment may occur after the devices have been installed. Coordination with the other installation activities onboard the vessel should be considered so that this does not occur. If obstructions or blockage of the fire detection devices can render the system less effective, these devices should be moved so the system is not impaired.

16. Materials

16.1 The materials that are supplied by the fire detection system vendor are generally as follows:

16.1.1 The main control panel and a remote annunciator (if specified).

16.1.2 Emergency batteries (if specified).

16.1.3 Field devices such as detectors, manually actuated fire alarm boxes, and alarm signalling devices.

16.2 The equipment that is used in the fire detection system should be from one source of supply to ensure that the devices that are being used are compatible with the main control panel. Compatibility is important so that the system operation is not impaired under alarm or any other conditions.

16.3 Equipment that may be supplied by the installer includes:

16.3.1 Cable:

16.3.1.1 Cable should be used that conforms to the manufacturer’s recommended types and regulations. The conductor should be continuous between devices (that is, splices should not be made between devices).

16.3.1.2 In addition, a T-tap on a wire should not be made because this will affect the ability of the control panel to supervise all of the conductors (the limitation on T-Taps may not apply to multiplex systems with addressable detectors). This occurs because supervision normally needs a loop with an end of line resistor to monitor continuity or shorting of the circuit.

16.3.2 Fasteners—The recommendations of the equipment manufacturer should be followed when mounting and connecting the equipment that was supplied by the vendor.

16.4 The materials that are supplied by the vendor and by the installer should be examined before installation to determine that the correct quantities are available and that the condition of the devices has not been affected as a result of shipping or storage before the installation of the devices. This is necessary so that the system can be installed in a continuous fashion with the likelihood of running out of equipment or using questionable equipment minimized.

17. Location of Equipment

17.1 The main panel and remote annunciator (if required) should be located in an area with low fire risk. The control units should be located on a vertical bulkhead in an unobstructed location. The height of the cabinet should be at a convenient height from the deck for ease of operator usage and visual checking. The device should be out of the way so mechanical damage is unlikely. If mechanical damage could occur to the control unit, a barrier should be installed to protect the unit.

17.2 Instruction Chart and Graphic Layout—If not shown on the face of the control panel, an instruction chart and graphic layout, as described in 11.5.3, should be placed at a convenient height next to the control panel and remote annunciator (if specified) and should not be obstructed from view.

17.3 Alarm Signalling Device:

17.3.1 Alarm signalling devices should be located throughout each protected zone so the alarm can be heard by anyone within that zone (see 11.3 for requirements).

17.3.2 A sign should be placed adjacent to the alarm signalling device as specified in 11.2.3.

17.3.3 Audibility at sea shall be verified in each protected zone with all mechanical equipment operating and all doors shut.

17.4 Installation of Manually Actuated Fire Alarm Boxes—Manually actuated fire alarm boxes should be installed at unobstructed points. The boxes should be located at the exit points, as described in 11.4, to the spaces and be marked.

17.5 Detectors:

17.5.1 The detectors should be located away from sources that normally produce heat or smoke which may cause a false alarm of the detector. The spacing of the detectors should be to the system specification, published information on the detectors, the installation drawings, and Section 10.

17.5.2 The detectors should be firmly mounted on the surface. The detector should put no stress on the field wiring which attaches the device to the control panel. The detectors should be positioned according to the manufacturer’s recommendations. The detectors should be placed away from air flows which could affect the performance of the detectors.

17.6 Batteries:

17.6.1 In some cases, batteries are supplied separately from the control panel. If separate batteries are supplied, they should be placed as close as possible and adjacent to the control panel.

17.6.2 In locating this battery box, caution should be exercised since the batteries may emit flammable gases during charging. Generally, these flammable gases are given off in small quantities, but the air flow should be such that these gases are not trapped in a small space, which could cause a hazard.
TESTING AND MAINTENANCE

18. General Information

18.1 Periodic maintenance and testing should be performed to ensure that the fire detection system is completely operable at all times. All components of the detection system should be tested at least once every six months, while some components require testing more frequently. Specific testing and maintenance intervals, and the recommended documentation, are covered in this section.

18.2 Complete installation, operation, and maintenance manuals for all components of the system should be kept on board the vessel. The manufacturer’s specified procedures shall be adhered to when performing tests or routine maintenance. If the manufacturer’s recommended service intervals are longer than those specified herein, the intervals specified in this section govern.

18.3 The operator of the vessel is directly responsible for performing maintenance and testing at the required intervals, and for keeping current the related documentation. The vessel owner should inspect these documents as necessary, to ensure that maintenance and testing have been performed in accordance with these recommendations.

18.4 In addition to keeping records of maintenance and testing intervals, a system log (see the sample in Appendix X1) should include a record by time and date of any system occurrence. All alarms and trouble signals, explained or unexplained, should be recorded by the zone. When possible, the detector or other device that initiated the alarm and cause should be recorded. This information is essential for trouble-shooting.

18.5 All equipment necessary to conduct the tests specified in this section should be available onboard the vessel at all times.

19. Testing Instructions

19.1 Functional tests should be performed on all components of the system for system commissioning and at a frequency recommended by the manufacturer but not less than specified in Table 3. A testing and maintenance log similar to Appendix X2 should be kept for the fire alarm system. The manufacturer’s maintenance and testing procedure should be followed and should include at least the following:

19.1.1 Smoke Detectors—Each smoke detector in the system should be tested separately by introducing smoke or other appropriate test gas. The receipt of an alarm condition should be verified at the control unit. If the detectors have a sensitivity measurement feature, readings should be taken and recorded. Detectors that are more sensitive than the manufacturer’s recommendation should be adjusted to the proper sensitivity or replaced.

19.1.2 Heat Detectors—Each detector should be tested separately by applying heat according to the manufacturer’s recommended procedure. The receipt of an alarm condition should be verified at the control unit.

19.1.3 Manually Actuated Fire Alarm Boxes—Each box should be operated and the receipt of an alarm condition verified at the control unit.

19.1.4 Flame Detectors—Each detector should be exposed to radiation from open flame or appropriate test lamps and the receipt of an alarm condition verified at the control unit.

19.1.5 Alarm Signalling Devices—Each device shall be operated during the testing of detectors and manually operated fire alarm boxes. The proper operation and sound levels should be verified. Separate manually activated alarm systems to summon the crew or notify passengers of fire, including the general alarm if so used, should also be tested.

19.1.6 Fire and Smoke Doors and Dampers—Operate the alarm system and verify proper operation of automatically operated doors and dampers. Visually inspect to verify that there are no obstructions, door props, and so forth to hinder operation.

19.1.7 Control Panel—In addition to the functional tests previously described, continuity on each external supervised circuit should be interrupted and a trouble indication observed with each interruption. Primary operating power should be interrupted and the control unit observed for proper operation and standby power. If multiple levels of standby power are provided, standby operation at all levels should be observed. It should be verified that appropriate indications of abnormal conditions occur during power interruption.

19.1.8 Sample Extraction Smoke Detection Systems—Sample systems should be tested by introducing smoke into each sampling point and observing an alarm indicating with each introduction. The system should be allowed to clear thoroughly between smoke tests of each sampling point. All supervisory functions should be tested by stimulating the necessary abnormal conditions and observing the proper indications at the control unit. As a minimum, the supervisory functions to be tested shall include:

19.1.8.1 Blowers, operating properly.

19.1.8.2 Primary Power, normal.

19.1.8.3 Annunciator (Repeater) Panel, light supervision.

19.1.8.4 Internal Power Circuitry, normal.

19.1.8.5 Photoelectric Lamps, normal.

19.1.8.6 Detection Module, which the sample air is drawn through, working properly.

19.1.9 Standby Batteries—Tests of batteries should only be performed when batteries are fully charged. The batteries should be subject to loading and the voltage observed on the battery after the loading has been applied. The manufacturer’s recommendations should be followed regarding the amount and duration of the load before voltage measurement. Check

^Visually inspect every month.
20. Maintenance

20.1 While the testing procedures previously described are of primary importance to ensure system integrity, proper operation of the system also requires that detection devices be cleaned regularly. Detection devices also need to be checked to ensure they have not been damaged, covered, or painted, which could effect the response to a fire condition. Recommended service intervals are as follows:

20.1.1 Smoke Detectors—Smoke detectors, both ionization and photoelectric, should be cleaned at intervals no greater than six months, and more frequently depending on the amount of airborne contaminants in the environment. The manufacturer’s recommended procedure should be followed to perform cleaning.

20.1.2 Flame (Optical) Detectors—The lenses of flame detectors should be cleaned at intervals not to exceed two months, or more frequently if conditions warrant. The manufacturer’s recommendations should be followed when performing the cleaning.

20.1.3 Heat Detectors—Heat detectors should be inspected at six-month intervals and cleaned if necessary to prevent any buildup of foreign material on the outside that would hinder the ability of the device to detect a fire condition.

21. Testing After Actual Fire Event

21.1 In the event of an actual fire, all fire detection equipment and wiring associated with the system in the area involved should be thoroughly tested and examined immediately after cleanup. The testing of the detectors and other system operating equipment should follow normal test and maintenance procedures.

21.2 Even though the continuity of the wiring and connectors is automatically supervised by the control panel, wires and cable should be examined for any damage that might cause a later failure. All important details of this fire should be recorded in the system log (see Appendix X1).

22. Testing and Maintenance Documentation

22.1 Appendix X2 provides a recommended format to be used whenever routine or nonroutine maintenance and testing are performed on the system.
Standard Specification for
Cast (All Temperatures and Pressures) and Welded Pipe Line Strainers (150 psig and 150°F Maximum)\textsuperscript{1}

1. Scope

1.1 This specification covers all cast strainers and welded strainers in services up to 150 psig and 150°F (1 MPa and 65°C). For welded strainers used in services above 150 psig and 150°F, see Specification F 1200.

1.2 This standard provides the minimum requirements for the design, fabrication, rating, marking, and testing of cast and welded pipe line strainers for services above 0°F (−18°C).

1.3 Strainers manufactured to this specification are acceptable for use in the marine environment.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 The following safety hazards caveat pertains only to the test methods portion, Section 8, of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

3.1 Definitions:

3.1.1 basket or element—the replaceable part in a strainer that performs the barrier separation of solid particles from flowing fluid. It is normally removable for cleaning and servicing and can be furnished in a wide variety of materials, particle size removal capability, straining area, and types of construction. Interchangeable baskets or elements are normally available for a given make, model, and size strainer.

3.1.2 maximum allowable working pressure (MAWP)—the highest internal pressure that the strainer can be subjected to in service. The maximum nonshock working pressure for which a strainer is rated by the manufacturer.

3.1.3 maximum design temperature—the maximum temperature for which a strainer is rated by the manufacturer.

3.1.4 strainer—a device which, when installed in a pipe line, provides a mechanical means of removing solids from a flowing liquid or gas by using a barrier element.

3.1.5 straining open area—the net effective open area of the clean element through which the fluid can pass.

4. Classification

4.1 Strainers may be classified into three general construction categories, simplex, duplex (or multiplex), and automatic (self-cleaning), as follows:

4.1.1 Simplex—A strainer consisting of a single basket or element chamber that normally requires the flow through the unit to be shut down before cleaning.

4.1.1.1 Classifications of simplex strainers based on port alignment relative to basket or element chamber are Y, T, Z, and others.

\textsuperscript{1} This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

\textsuperscript{2} Annual Book of ASTM Standards, Vol 01.07.

\textsuperscript{3} Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036.

\textsuperscript{4} Available from American Society of Mechanical Engineers (ASME), ASME International Headquarters, Three Park Ave., New York, NY 10016-5990.

\textsuperscript{5} Available from Manufacturers Standardization Society of the Valve and Fitting Industry, Inc., 1815 N. Fort Myer Dr., Arlington, VA 22209.
4.1.2 Duplex (or Multiplex)—A strainer usually consisting of at least two basket or element chambers separated by a valve (or valving) that permits continuous flow of fluid through one chamber while the other is accessible for cleaning.

4.1.3 Automatic (Self-Cleaning)—A strainer providing some means for back-flushing or cleaning of the straining element while the unit is in service. It can have one or more elements and may require periodic shutdown for maintenance and inspection.

4.2 Strainers may be further classified by pressure ratings and types of port connections, port alignments relative to unit center lines, cover closures, valve types (in duplex), types of baskets or elements, materials of construction, and other features of design.

5. Ordering Information

5.1 Orders for products under this specification shall include the following information as applicable. If a manufacturer’s standardized product is being ordered, include all data needed by the manufacturer to define the product.

5.1.1 Make.
5.1.2 Model (simplex or duplex).
5.1.3 Port size.
5.1.4 Port connections.
5.1.5 Maximum allowable pressure/temperature rating.
5.1.6 Body and cover material.
5.1.7 Type of cover closure.
5.1.8 Basket (element) material.
5.1.9 Basket hole size.
5.1.10 Optional design features.
5.1.11 Certification (see 8.1.2.1 and Section 9).
5.1.12 This ASTM standard designation number.
5.1.13 Additional requirements or testing as contracted by the manufacturer and purchaser.

5.2 If a product is to be specified by performance criteria rather than model description, then the following should be specified:

5.2.1 Maximum allowable clean pressure loss at a given flow capacity of a given liquid at a given velocity.
5.2.2 Temperature and pressure.
5.2.3 Straining area.
5.2.4 Minimum basket rupture differential pressure (see 7.4).
5.2.5 Maximum valve seepage rates (see 7.3).
5.2.6 Certification (see 6.2, 8.1.2.1, and Section 9).
5.2.7 For self-cleaning strainers, specify basket cleaning effectiveness and endurance testing.

5.3 In general, the standard product description should not be mixed with the performance criteria because conflicting specifications can result (for example, maximum allowable pressure loss inconsistent with product size).

6. Materials and Manufacture

6.1 Strainer housings, as well as any pressure-retaining parts, including bolting used for pressure retention, shall be constructed of materials listed in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code (hereafter called ASME Code) or ANSI/ASME B31.1. Bolts, screws, and fasteners in contact with interior fluid shall be of appropriate corrosion-resistant material.

6.2 The pressure ratings established under this specification are based on materials of high quality produced under regular control of chemical and mechanical properties by a recognized process. The manufacturer shall be prepared to submit a certificate of compliance verifying that his product has been so produced and that it has been manufactured from material whose chemical and mechanical properties are at least equal to the requirements of the appropriate standard or specification.

6.3 For materials not having values of allowable stress tabulated in Section VIII, Division 1 of the ASME Code, allowable stresses shall be determined in accordance with the procedures outlined in Subsection C and Appendix P of that section. Where it can be shown that the values of allowable stress listed for a particular material in one product form (because of similar chemistry, mechanical properties, heat treatment, and so forth) are applicable to the same material in an unlisted product form, the listed values of allowable stress may be used.

6.4 Seals and parts, other than pressure-retaining parts and bolting used for pressure retention, shall be of materials suitable for the service.

6.5 Users are cautioned against applications with fluids which may react chemically with any materials used in these products in contact with the fluid.

6.6 Cast iron shall be limited to services below 450°F (232°C). Cast iron fittings conforming to B16.1 and B16.4 are limited to Class 125 and Class 250.

7. Other Requirements

7.1 The maximum allowable working pressure (MAWP) and maximum design temperature (MAT) rating of strainers covered under this specification shall be established by at least one of the following methods:

7.1.1 Proof test in accordance with the requirements prescribed in paragraph UG-101 of Section VIII of the ASME Code. If burst-type tests as outlined in paragraph UG-101(m) are used, it is not necessary to rupture the component. In this case, the value of B to be used in determining the MAWP shall be the maximum pressure to which the component was subjected without rupture. Safety of personnel shall be given serious consideration when conducting proof tests. Components that have been subjected to a proof test shall not be offered for sale.

7.1.2 Design calculations in accordance with the requirements prescribed in Section VIII, Division 1 of the ASME Code.

7.1.3 Extensive and successful performance experience under comparable service conditions with similar materials may be used as a basis for rating provided all other provisions of this specification are met.

7.2 Pipe end connections for strainers shall be in accordance with one of the standards listed in 2.2 and 2.3 or as agreed upon between the purchaser and manufacturer (see 5.1.13). Threaded pipe connections shall be limited to the following pressures:

- ¼ in. (19 mm) NPS and below . . . 1500 psig (10.3 MPa) max
1. Strainers shall be capable of handling 10 psig (0.069 MPa) differential pressure without rupturing or such other differential pressure as contracted by the manufacturer and purchaser (see 5.2.4) for the application involved.

2. Test Methods

8.1 Test all strainers by one of the following methods:

8.1.1 Conduct a hydrostatic test at 1 1/2 times the 100°F (37°C) rated MAWP of the strainer. Perform the test with water or other liquid having a maximum viscosity of 40 SSU at 125°F (52°C) with a maximum pressure test temperature of 125°F. The minimum duration of the test shall be 15 s for strainers less than 2-in. (50-mm) nominal pipe size (NPS), 1 min for strainers 2 1/2 through 8 in. (63 through 203 mm), and 3 min for larger sizes. The purpose of this test is to detect leaks and structural imperfections. No visible leakage is permitted.

8.1.2 Strainers 2-in. (50-mm) NPS and smaller with other than flanged connections may, at the option of the manufacturer, be air tested to the lesser of 1.2 times the MAWP or 80 psig (0.55 MPa). The minimum duration of the test shall be 15 s. Visually detectable leakage is not acceptable.

8.1.2.1 If this option is exercised, the manufacturer shall be able to certify that a prototype of the same size strainer was subjected to a hydrostatic test in accordance with 8.1.1.

9. Certification

9.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser stating that samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

10. Product Marking

10.1 Each strainer shall have a securely attached name plate or other permanent marking indicating:

10.1.1 Manufacturer’s name or trademark.
10.1.2 Maximum allowable working pressure.
10.1.3 Size (end connection NPS size).
10.1.4 Direction of flow (by an arrow or the word “inlet,” “outlet,” or both).
10.1.5 ASTM designation of this specification.

11. Quality Assurance

11.1 The strainer manufacturer shall maintain the quality of the strainers that are designed, tested, and marked in accordance with this specification. At no time shall a strainer be sold indicating that it meets the requirements of this specification if it does not meet the requirements herein.

12. Keywords

12.1 automatic strainer; cast pipe line strainers; cast strainers; duplex strainer; simplex strainer; strainer; welded pipe line strainers; welded strainers
Standard Specification for Fabricated (Welded) Pipe Line Strainers (Above 150 psig and 150°F)\textsuperscript{1}

This standard is issued under the fixed designation F 1200; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers welded strainers in services above 150 psig or 150°F (1 MPa and 65°C). For welded strainers in services at or below these ratings and cast strainers, see Specification F 1199.

1.2 This specification provides the minimum requirements for the design fabrication, rating, marking, and testing of welded pipe line strainers for services above 0°F (−18°C).

1.3 Strainers manufactured to this specification are acceptable for use in the marine environment.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 The following safety hazards caveat pertains only to the test methods portion, Section 8, of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

4. Classification

4.1 Strainers may be classified into three general construction categories, simplex, duplex (or multiplex), and automatic (self-cleaning), as follows:

4.1.1 Simplex—A strainer consisting of a single basket or element chamber that normally requires the flow through the unit to be shut down before cleaning.

4.1.1.1 Classifications of simplex strainers based on port alignment relative to basket or element chamber are Y, T, Z, and others.

4.1.2 Duplex (or Multiplex)—A strainer usually consisting of at least two basket or element chambers separated by a valve (or valving) that permits continuous flow of fluid through one chamber while the other is accessible for cleaning.

4.1.3 Automatic (Self-Cleaning)—A strainer providing some means for back-flushing or cleaning of the straining element while the unit is in service. It can have one or more elements and may require periodic shutdown for maintenance and inspection.

4.2 Strainers may be further classified by pressure ratings and types of port connections, port alignments relative to unit center lines, cover closures, valve types (in duplex), types of baskets or elements, materials of construction, and other features of design.

5. Ordering Information

5.1 Orders for products under this specification shall include the following information as applicable. If a manufacturer's standardized product is being ordered, include all data needed by the manufacturer to define the product.

5.1.1 Make.

5.1.2 Model (simplex or duplex).

5.1.3 Port size.

5.1.4 Port connections.

5.1.5 Maximum allowable working pressure/temperature rating.

5.1.6 Body and cover material.

5.1.7 Type of cover closure.

5.1.8 Basket (element) material.

5.1.9 Basket hole size.

5.1.10 Optional design features.

5.1.11 Certification (see 6.4, 8.1.2.1, and Section 9).

5.1.12 Nondestructive examination requirements (see 8.2).

5.1.13 This ASTM standard designation number.

5.1.14 Additional requirements or testing as contracted by the manufacturer and purchaser.

5.2 If a product is to be specified by performance criteria rather than model description, then the following should be specified:

5.2.1 Maximum allowable clean pressure loss at a given flow capacity of a given liquid at a given viscosity.

5.2.2 Temperature and pressure.

5.2.3 Straining area.

5.2.4 Minimum basket rupture differential pressure (see 7.9).

5.2.5 Maximum valve seepage rates (see 7.8).

5.2.6 Certification (see 6.4, 8.1.2.1, and Section 9).

5.2.7 For self-cleaning strainers, specify basket cleaning effectiveness and endurance testing.

5.3 In general, the standard product description should not be mixed with the performance criteria because conflicting specifications can result (for example, maximum allowable pressure loss inconsistent with product size).

6. Materials and Manufacture

6.1 Strainer housings, as well as any pressure-retaining parts, including bolting used for pressure retention, shall be constructed of materials listed in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code (hereafter called ASME Code) or ANSI/ASME B3.1. Bolts, screws, and fasteners in contact with interior fluid shall be of appropriate corrosion-resistant material.

6.2 The pressure ratings established under this specification are based on materials of high quality produced under regular control of chemical and mechanical properties by a recognized process. The manufacturer shall be prepared to submit a certificate of compliance verifying that his product has been manufactured from material whose chemical and mechanical properties are at least equal to the requirements of an acceptable standard or specification.

6.3 For materials not having values of allowable stress tabulated in Section VIII, Division 1 of the ASME Code, allowable stresses shall be determined in accordance with the procedures outlined in Subsection C and Appendix P of that section. Where it can be shown that the values of allowable stress listed for a particular material in one product form (because of similar chemistry, mechanical properties, heat treatment, and so forth) are applicable to the same material in an unlotted product form, the listed values of allowable stress may be used.

6.4 Seals and parts, other than pressure-retaining parts and bolting used for pressure retention, shall be of materials suitable for the service.

6.5 Users are cautioned against applications with fluids which may react chemically with any materials used in these products in contact with the fluid.

7. Other Requirements

7.1 The maximum allowable working pressure (MAWP) and maximum design temperature rating of strainers covered under this specification shall be established by at least one of the following methods:

7.1.1 Proof test in accordance with the requirements prescribed in paragraph UG-101 of Section VIII of the ASME Code. If burst-type tests as outlined in paragraph UG-101(m) are used, it is not necessary to rupture the component. In this case, the value of B to be used in determining the MAWP shall be the maximum pressure to which the component was subjected without rupture. Safety of personnel shall be given serious consideration when conducting proof tests. Components that have been subjected to a proof test shall not be offered for sale.

7.1.2 Design calculations in accordance with the requirements prescribed in Section VIII, Division 1 of the ASME Code.
7.1.3 Extensive and successful performance experience under comparable service conditions with similar materials may be used as a basis for rating provided all other provisions of this specification are met.

7.2 Strainers may be cast, forged, or fabricated of plates, tubes, or pipes. Welding on pressure-retaining components shall be as specified below.

7.3 Welded joint design details shall be in accordance with Section VIII, Division 1 of the ASME Code except as noted in 7.4 and 7.5. Supplemental radiography requirements are presented in Section 8 of this specification. Welders and weld procedures shall be qualified in accordance with Section IX of the ASME Code. Except for fillet welds, all welds shall be full penetration welds extending through the entire thickness of the shell.

7.4 Inlet and outlet connections consisting of welded flanges and fittings shall be in accordance with Specification F 722. Pipe end connections for strainers shall be in accordance with one of the standards listed in 2.2 or 2.3. Where radiography is required by 8.2.2, all welded inlet and outlet connections shall be butt-weld joints as required by Specification F 722 for Class 1 piping systems.

7.5 Welds on strainers greater than 6-in. (152-mm) internal diameter or 1.5-ft³ (0.042-m³) net internal volume rated above 600 psi (4.14 MPa) or 400°F (204°C) shall be of the following types as listed in Table UW-12 of the ASME Code: Type (1) for Category A joints; Types (1) or (2) for Category B joints; and all Category C and D joints shall be full penetration welds extending through the entire thickness of the vessel wall or nozzle wall. Welded joint categories are defined under UW-3 of the ASME Code.

7.6 Post-weld heat treatment shall be in accordance with Section VIII, Division 1 except as noted in 7.6.1.

7.6.1 Strainers fabricated of carbon or low alloy steel, greater than 6-in. (152-mm) internal diameter or 1.5-ft³ (0.042-m³) net internal volume, rated above 600 psi (4.14 MPa) or 400°F (204°C), shall be post-weld, heat-treated regardless of thickness.

7.7 Threaded pipe connections shall be limited to the following pressures:

- ¾ in. (19 mm) NPS and below...1500 psig (10.34 MPa) max
- 1 in. (25 mm) NPS and below...1200 psig (8.27 MPa) max
- 2 in. (50 mm) NPS and below...600 psig (4.14 MPa) max
- 3 in. (76 mm) NPS and below...400 psig (2.76 MPa) max

7.7.1 Threaded pipe joints above 2-in. (50-mm) nominal pipe size (NPS) shall not be used in systems that require radiographic examination listed in 8.2.2.

7.8 Duplex (or multiplex) strainer valve seepage rates shall be minimized to prevent undue spillage of fluid under normal operating conditions while the element is being serviced or cleaned in accordance with the manufacturer’s procedures. Maximum seepage rates with a specified liquid at a specified pressure and temperature may be as contracted by the manufacturer and purchaser (see 5.2.5), and provision may be made to include a test to determine acceptability before acceptance for a given application.

7.9 Baskets or elements shall withstand a minimum of 10-psi (0.069-MPa) differential pressure without rupturing or such other differential pressure as contracted by manufacturer and purchaser (see 5.2.4) for the application involved.

8. Test Methods

8.1 Test all strainers by one of the following methods:

8.1.1 Conduct a hydrostatic test at 1½ times the 100°F (38°C) rated MAWP of the strainer. Perform the test with water or other liquid having a maximum viscosity of 40 SSU at 125°F (52°C) with a maximum pressure test temperature of 125°F (52°C). The minimum duration of the test shall be 15 s for strainers less than 2-in. (50-mm) NPS, 1 min for strainers 2½ through 8 in. (63 through 203 mm), and 3 min for larger sizes. The purpose of this test is to detect leaks and structural imperfections. No visible leakage is permitted.

8.1.2 Strainers of 2-in. (50-mm) NPS and smaller with other than flanged connections may, at the option of the manufacturer, be air tested to the lesser of 1.2 times MAWP or 80 psig (0.55 MPa). The minimum duration of the test shall be 15 s. Visually detectable leakage is not acceptable.

8.1.2.1 If this option is exercised, the manufacturer shall be able to certify that a prototype of the same size strainer was subjected to a hydrostatic test in accordance with 8.1.1.

8.2 Examine welds as follows:

8.2.1 Visually examine all welds in accordance with ANSI B31.1.

8.2.2 Welded inlet and outlet connections of a strainer that are equal to or greater than 4-in. (100-mm) nominal diameter or 0.375-in. (9.5-mm) nominal wall thickness in the following services shall be 100 % radiographically examined in accordance with UW-51 of the ASME Code.

A Flash point measured in accordance with Test Methods D 93.
B Includes lubricating oils, hydraulic fluids, and heat transfer oils.

8.2.3 All butt-welds on strainers greater than 6-in. (152-mm) internal diameter or 1.5-ft³(0.042-m³) net internal volume rated above 600 psi (4.14 MPa) or 400°F (204°C) shall be fully radiographed in accordance with UW-51 of the ASME Code.

9. Certification

9.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser stating that samples representing each lot have been manufactured, tested, and inspected in accordance with this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

10. Product Marking

10.1 Each strainer shall have a securely attached name plate or other permanent marking indicating:

10.1.1 Manufacturer’s name or trademark.

10.1.2 Maximum allowable working pressure.
10.1.3 Size (end connection NPS size).
10.1.4 Direction of flow (by an arrow or the word “inlet,” “outlet,” or both).
10.1.5 ASTM designation number of this specification.
   10.1.5.1 An “X” shall be placed after the ASTM designation if the welds are radiographed in accordance with Section 8 of this specification.

11. Quality Assurance
   11.1 The strainer manufacturer shall maintain the quality of the strainers that are designed, tested, and marked in accordance with this specification. At no time shall a strainer be sold indicating that it meets the requirements of this specification if it does not meet the requirements herein.

Standard Specification for
Fluid Conditioner Fittings in Piping Applications Above 0°F

This standard is issued under the fixed designation F 1201; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification provides the minimum requirements for pressure-retaining components of fluid conditioner fittings. It addresses the pressure-retaining component design, fabrication, rating, marking, and testing.

1.2 This specification is not intended to override any of the present fluid conditioner fitting specifications specific to devices such as strainers, filters, and traps but should be used for devices for which a specific specification does not apply.

1.3 This specification provides sufficient requirements to allow a fluid conditioner fitting to be used in the marine environment.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 The following precautionary caveat pertains only to the test methods portion, Section 7, of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

SP-67 Butterfly Valves
2.4 ASME Standard:⁶
ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, Pressure Vessels
ASME Boiler and Pressure Vessel Code: Section IX, Welding and Brazing Qualifications

3. Terminology

3.1 Definitions:
3.1.1 fluid conditioner fitting—a device, other than a valve or pipe or pipe joining fitting, installed in a pressure piping system, that monitors or provides for the monitoring of the fluid, or otherwise operates on or alters the condition of the fluid.

3.1.2 maximum allowable working pressure (MAWP)—the highest internal pressure at the maximum design temperature that the fluid conditioner fitting can be safely subjected to in service.

3.1.3 maximum design temperature—the maximum temperature for which the fluid conditioner fitting is rated by the manufacturer.

3.1.4 multiplex fluid conditioner fitting—a fluid conditioner fitting that is made up of multiples of a single unit connected by either manifolding, piping, tubes, or valves.

³ This specification is under the jurisdiction of ASTM Committee F25 on Ships and Marine Technology and is the direct responsibility of Subcommittee F25.11 on Machinery and Piping Systems.

4. Classification

4.1 Class I—Fluid conditioner fitting meeting the following requirements:

<table>
<thead>
<tr>
<th>Service</th>
<th>Pressure, psig (MPa)</th>
<th>Temperature, °F (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liquefied flammable gas</td>
<td>above 150 (1.03) . . .</td>
<td>above 0 (−18)</td>
</tr>
<tr>
<td>Fuels</td>
<td>above 150 (1.03) . . .</td>
<td>above 150 (66)</td>
</tr>
<tr>
<td>Liquids with a flash point a</td>
<td>above 225 (1.55) . . .</td>
<td>above 150 (66)</td>
</tr>
<tr>
<td>150°F (66°C) or below</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Liquids with a flash point b</td>
<td>above 225 (1.55) . . .</td>
<td>above 400 (204)</td>
</tr>
<tr>
<td>150°F (66°C)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Steam, gases, and vapors</td>
<td>above 150 (1.03) . . .</td>
<td>above 650 (343)</td>
</tr>
<tr>
<td>Water</td>
<td>above 225 (1.55) . . .</td>
<td>above 350 (177)</td>
</tr>
</tbody>
</table>

a Flash point measured in accordance with Test Methods D 93.
b Includes lubricating oils, hydraulic fluids, and heat transfer oils.

4.2 Class II—All other fluid conditioner fittings.

5. Materials and Manufacture

5.1 Pressure-retaining parts shall be constructed of materials listed in Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code (hereafter called the ASME Code) or ANSI B31.1. Nonmetallic materials may be used for pressure-retaining parts provided the material is suitable for the intended service and is compatible with the fluid to be conducted.

5.2 Fluid conditioner fittings intended for flammable service with nonmetallic materials or metallic materials having a solidus to liquidus temperature below 1700°F (927°C) shall pass the prototype fire test in 7.2.

5.3 Bolting materials shall be at least equal to those listed in Table 1 of ANSI B16.5 or Table 126.1 of ANSI B31.1. Bolts, screws, and fasteners in contact with interior fluid shall be compatible with the fluid. Carbon steel bolting shall not be used in services rated above 500°F (260°C).

5.4 Gaskets and seals shall be of materials suitable for the intended service.

5.5 The pressure ratings established under this specification are based on materials of high quality produced under regular control of chemical and mechanical properties by a recognized process. The manufacturer shall be prepared to submit a certificate of compliance verifying that his product has been so produced and that it has been manufactured from material whose chemical and mechanical properties are at least equal to the requirements of the appropriate specification.

5.6 For materials not having values of allowable stress tabulated in Section VIII, Division 1 of the ASME Code, allowable stresses shall be determined in accordance with the procedures outlined in Subsection C and Appendix P of that section. Where it can be shown that the values of allowable stress listed for a particular material in one product form (because of similar chemistry, physical properties, heat treatment, and so forth) are applicable to the same material in an unlisted product form, the listed values of allowable stress may be used.

5.7 Cast iron shall be limited to services below 450°F (232°C). Cast iron fittings conforming to B16.1 and B16.4 are limited to Class 125 and 250.

5.8 Users are cautioned to exercise care in the selection of materials, as some fluids may react chemically with some materials used in these products.

6. Other Requirements

6.1 The maximum allowable working pressure (MAWP) of fluid conditioner fittings covered under this specification shall be established by at least one of the following methods:

6.1.1 Proof test in accordance with the requirements prescribed in paragraph UG-101 of Section VIII, Division 1 of the ASME Code. If burst-type tests as outlined in paragraph UG-101(m) are used, it is not necessary to rupture the component. In this case, the value of B to be used in determining the MAWP shall be the maximum pressure to which the component was subjected without rupture.

6.1.2 Design calculations in accordance with the requirements prescribed in Section VIII, Division 1 of the ASME Code.

6.2 Where welded construction is used, weld joint design details shall be in accordance with Section VIII, Division 1 of the ASME Code except as noted in 6.3. Supplemental radiography requirements are presented in 7.3. Welders and weld procedures shall be qualified in accordance with Section IX of the ASME Code. Except for fillet welds, all welds shall be full penetration welds extending through the entire thickness of the shell.

6.3 Welds on fluid conditioner fittings greater than 6-in. (152-mm) internal diameter or 1.5-ft³ (0.042-m³) net internal volume and rated above 600 psi (4.14 MPa) or 400°F (204°C) shall be of the following types as listed in Table UW-12 of the ASME Code: Type (1) for Category A joints; Types (1) or (2) for Category B joints; and all Category C and D joints shall be full penetration welds extending through the entire thickness of the vessel wall or nozzle wall. Welded joint categories are defined under UW-3 of the ASME Code.

6.4 Post-weld heat treatment shall be in accordance with Section VIII, Division 1, except that fluid conditioner fittings greater than 6-in. (152-mm) internal diameter or 1.5-ft³ (0.042-m³) net internal volume, rated above 600 psi (4.14 MPa) or 400°F (204°C), and fabricated of carbon or low alloy steel, shall be post-weld, heat-treated regardless of thickness.

6.5 Inlet and outlet connections consisting of welded flange end fittings shall be in accordance with Specification F 722. Pipe end connections for fluid conditioner fittings shall be in accordance with one of the specifications listed in 2.2 or 2.3. Where radiography is required by 7.3.2, all welded inlet and outlet connections shall be butt-weld joints as required by Specification F 722 for Class 1 piping systems. Threaded inlet and outlet connections shall be in accordance with 6.6.

6.6 Threaded pipe connections shall be limited to the following services:

| NPS ¼ in. (20 mm) and below . . . 1500 psig (10.3 MPa) max |
| NPS 1 in. (25 mm) and below . . . 1200 psig (8.27 MPa) max |
| NPS 2 in. (50 mm) and below . . . 600 psig (4.14 MPa) max |
| NPS 3 in. (80 mm) and below . . . 400 psig (2.76 MPa) max |

6.7 Threaded pipe joints above nominal pipe size (NPS) 2 (50 mm) shall not be used in systems that require radiographic examination in 7.3.2.

6.8 For multiplex fluid conditioner fittings:

6.8.1 Piping and valves shall be in accordance with ANSI B31.1. Welded joints used in the interconnected piping shall be in accordance with Specification F 722 for equivalent class of pipe.
6.8.2 The maximum valve seat leakage shall not be greater than that allowed by MSS SP-61 or SP-67.

6.8.3 There shall be continuous fluid flow during changeover of the elements.

6.9 For a fluid conditioner fitting requiring cleaning or servicing, its construction shall facilitate cleaning and minimize fluid spillage.

6.10 All performance ratings assigned to a fluid conditioner fitting shall be confirmed by calculations or testing (see 7.4), or both, and certified by the manufacturer.

6.11 If an external protective device is required for the fluid conditioner fitting to pass the fire test in 7.2, the device shall sufficiently encase the fluid conditioner fitting to protect the fitting from a fire when it is installed in its normal position(s).

7. Test Methods

7.1 All fluid conditioner fittings shall be pressure tested by one of the following methods:

7.1.1 Conduct a hydrostatic test at 1 1/2 times the 100°F (37°C) rated MAWP of the fluid conditioner fitting. Perform the test with water or other liquid having a maximum viscosity of 40 SSU at 125°F (52°C) with a maximum pressure test temperature of 125°F (52°C). The minimum duration of the test shall be 15 s for fluid conditioner fittings less than NPS 2 (50 mm), 1 min for fluid conditioner fittings NPS 2 1/2 (63 mm) through 8 (203 mm), and 3 min for larger sizes. The purpose of this test is to detect leaks and structural imperfections. No visible leakage is permitted.

7.1.2 Class II fluid conditioner fittings of NPS 2 (50 mm) and smaller with other than flanged connections may, at the option of the manufacturer, be air tested to the lesser of 1.2 times the MAWP or 80 psig (0.55 MPa). The minimum duration of the test shall be 15 s. Visually detectable leakage is not acceptable.

7.1.2.1 Manufacturers exercising this option shall also certify that a prototype from each production lot of the same size fluid conditioner fitting was subjected to a hydrostatic test in accordance with 7.1.1.

7.2 Test a prototype of a fluid conditioner fitting design that requires a fire test in accordance with 5.2 as follows:

7.2.1 Position the fluid conditioner fitting 9 in. (230 mm) above the top edge of an open pan of heptane large enough to engulf the fluid conditioner fitting completely in the fire. The pan shall conform to the following minimum dimensions:

7.2.1.1 Depth, 1 1/2 in. (38 mm).

7.2.1.2 Width, twice the width of the fluid conditioner fitting but no less than 8 1/2 in. (220 mm).

7.2.1.3 Length, twice the length of the fluid conditioner fitting but no less than 14 in. (360 mm).

7.2.2 Add to the pan sufficient heptane to provide for a 2 1/2-min burn.

7.2.3 Mount thermocouples so as to sense the flame temperature in the same plane and elevation as the fluid conditioner fitting assembly. Pressurize with water the fluid conditioner fitting to its MAWP during the burning portion of the test. Following ignition of the heptane, begin timing and monitor the temperature. The temperature shall reach a minimum of 1200°F (649°C) but shall not exceed 1350°F (732°C). If 1200°F (649°C) is not reached, repeat the test using a new specimen. If 1350°F (732°C) is exceeded, discard the results and repeat the test.

7.2.4 At the end of the 2 1/2-min of fire exposure, extinguish the flame, relieve the pressure, and allow the water to flow through the assembly. With free flow established, pressurize the fluid conditioner fitting to its MAWP and hold for 30 s. Failure to establish a free flow, or any fluid leakage during fire exposure or the subsequent pressure test, shall constitute failure.

7.2.5 Mount in their normally installed position those fluid conditioner fittings that require external protective devices installed to pass the above fire test. Test in each position those fluid conditioner fittings that can be mounted in more than one position. A different fluid conditioner fitting may be used for each test. If it is possible for this protection to be separated from the fluid conditioner fitting body by purchasers or users, mark the body to indicate that this protection is required (see 9.2).

7.2.6 Test only the smallest and largest sizes of a particular fluid conditioner fitting design to certify the design as having passed the above fire test.

NOTE 1—Manufacturers are cautioned that the application of this test can be hazardous. It is recommended that it be performed by a qualified laboratory familiar with the conduct of this type test.

7.3 Inspect all welds as follows:

7.3.1 Visually examine all welds in accordance with ANSI B31.1.

7.3.2 Welded inlet and outlet connections of Class I fluid conditioner fittings, equal to or greater than 4-in. (100-mm) nominal diameter or 0.375-in. (9.5-mm) nominal wall thickness, shall be 100% radiographically examined in accordance with UW-51 of the ASME Code.

7.3.3 For Class I multiplex fluid conditioner fittings, all butt-welds in interconnected piping greater than 4-in. (100-mm) nominal diameter or 0.375-in. (9.5-mm) nominal wall thickness shall be 100% radiographically examined in accordance with UW-51 of the ASME Code.

7.3.4 Fluid conditioner fittings greater than 6-in. (152-mm) internal diameter or 1.5-ft 3 (0.042-m 3 ) net internal volume and rated above 600 psi (4.14 MPa) or 400°F (204°C) shall have all butt-welds fully radiographed in accordance with UW-51 of the ASME Code.

7.4 A prototype of each fluid conditioner fitting having designated performance ratings not confirmed by calculations shall be tested to verify the ratings. The test shall be of the manufacturer’s specification practice and shall be suitable for the type, size, and capacity of the fluid conditioner fitting.

7.4.1 Test only that combination of sizes, capacities, and so forth, of a particular fluid conditioner fitting design to certify the ratings of a complete family of a fluid conditioner fitting of the design.

8. Certification

8.1 When specified in the purchase order or contract, the manufacturer’s certification shall be furnished to the purchaser stating that samples representing each lot or prototypes have been manufactured, tested, and inspected in accordance with
this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

9. Product Marking

9.1 Each fluid conditioner fitting shall have a securely attached name plate or other permanent marking indicating the following:

  9.1.1 Manufacturer’s name or trademark.
  9.1.2 Maximum allowable working pressure and temperature as designed and tested (for example, 150 psi at 150°F).
  9.1.3 Size (end connection NPS).
  9.1.4 ASTM designation number of this specification.
  9.1.5 Direction of flow (by an arrow or the word “inlet,” “outlet,” or both).

  9.1.6 If radiographed in accordance with 7.3, an “X” shall be placed after the ASTM designation number.

  9.2 If a removable protective device is installed to pass the fire test of 7.2.5, an “S” shall be placed after the ASTM designation number.

10. Quality Assurance

10.1 The fluid conditioner fitting manufacturer shall maintain the quality of the fluid conditioner fittings that are designed, tested, and marked in accordance with this specification. At no time shall a fluid conditioner fitting be sold indicating that it meets the requirements of this specification if it does not meet the requirements herein.

11.1 fluid conditioner fittings; piping applications; pressure-retaining components
Standard Specification for Electrical Insulation Monitors for Monitoring Ground Resistance in Active Electrical Systems [Metric]\(^1\)

This standard is issued under the fixed designation F 1207M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers electrical insulation monitoring devices, intended as permanently installed units, for use in the detection of ohmic insulation faults to ground in active, ac ungrounded electrical systems.

1.2 Limitations—This specification does not cover devices which are not intended for operation for: dc ungrounded systems or ac ungrounded systems with dc components unless ac to dc conversion is isolated from the monitored system with transformers.

1.3 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.

1.4 The following precautionary caveat pertains only to the test methods portion, Section 9, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 UL Standard:
UL 1053 Ground-Fault Sensing and Relaying Equipment\(^2\)

3. Terminology

3.1 Definitions:

3.1.1 ac internal resistance—a monitor’s impedance between the measuring terminals and ground terminals.

3.1.2 ac ungrounded electrical system—a monitored system that has no intentional connection from phase or neutral to ground and can continue to perform normally if one conductor becomes connected to ground.

3.1.3 dc internal resistance—a monitor’s ohmic resistance between the measuring and ground terminals.

3.1.4 input voltage—the supply voltage at the terminals of an insulation monitor.

3.1.5 measuring voltage—the output dc voltage from the insulation monitor that is superimposed between the ac ungrounded system and ground.

3.1.6 nominal contact voltage—the voltage rating for a monitor’s internal relay contacts.

3.1.7 nominal frequency—the frequency of a monitored system.

3.1.8 nominal voltage—the voltage (phase-to-phase) of a monitored system.

3.1.9 response value—the adjustable or preset set point value of system insulation resistance for which an insulation monitor will provide alarm indication.

3.1.10 system insulation resistance—the total insulation resistance to ground to be monitored which is measured by dc voltage.

4. Monitor Classification

4.1 Type 1—Insulation monitor for 115-V, 3-phase or single-phase, 60-Hz, ac ungrounded electrical systems.

4.2 Type 2—Insulation monitor for 115-V, 3-phase or single-phase, 400-Hz, ac ungrounded systems.
